Re Arbitration Order 2 / 2007  
DOT Fin Project No. 412326-3-72-03  
Orange County, FL.

Dear Mr. Blanchard,

Find enclosed Arbitration Order 2 / 2007 for the above captioned project. A copy of the transcript is enclosed, and copies of the Contractors submittal and the Department rebuttal are being kept by Board Member Ananth Prasad for your use.

Sincerely;

State Arbitration Board

John W. Nutbrown,  
Chairman and Clerk

**MAR 16 2007**

**FILED**

**///NOTICE///**

In the case of American Water Services Underground Infrastructure, Inc. versus the Florida Department of Transportation on Financial Project No. 412326-3-72-03 in Orange County, Florida, both parties are advised that the State Arbitration Board Order 2-2007 has been properly filed with The Clerk of the State Arbitration Board on March 16, 2007

John W. Nutbrown  
Chairman & Clerk, S.A.B.

Copy of Order & Transcript to:

Tim Lattner, Director of State Maintenance Office  
Mike Cannon, Senior Vice President American Water  
Services Underground Infrastructure, Inc.

## STATE ARBITRATION BOARD

Order No. 2-2007

RE: Request for Arbitration  
American Water Services Underground Infrastructure, Inc  
State Financial Project No. 412626-3-72-03, in  
Orange County, Florida

The following members of the State Arbitration Board participated:

John W. Nutbrown, Chairman  
Ananth Prasad, P.E., Board Member  
John C. Norton, Board Member

Pursuant to a written notice, a hearing was held on a request for arbitration commencing at 1:00 PM January 26, 2007

The Contractor, American water services Underground Infrastructure, Inc. presented a written request for arbitration of its claim in the total amount of \$257,286.69. The claim arises out of direction by the Florida Department of Transportation requiring the removal and replacement of a cured-in-place pipe liner for a 43"x 68" Elliptical Pipe in Orange County, Florida. The Department of Transportation presented a written rebuttal and summary of position. The Board has considered the written submissions and the testimony and evidence presented at the hearing on January 26, 2007 and enters this Order Number 2-2007.

### **ORDER**

The Board is unanimous in this decision.

It should be noted that this Order is a bit unusual as it involves a Maintenance Contract which is not usually heard by this Board. This case originated in the Circuit Court of the Ninth Judicial Circuit in and for Orange County, Florida. The Court ordered the case be held in abeyance and returned to the State Arbitration Board for action.

American Water Services, Inc contracted to install Cured-in-Place Pipe Liner in 529 Lineal Feet of 43"x 68" Elliptical Pipe. Prior to bidding the project the EOR requested American Water state the size of liner required. The proposed liner was to be for 56.89" for a pipe of this diameter. The Contract Pay Item used for this contract was 431-1-142 and states that the 54-inch pay item is equivalent to the 43" X 68" Elliptical Pipe.

The Board heard testimony from both parties and asked questions relating to the installation and the later rejection of the material. A number of meetings were held between the Contractor, Design Engineer and the Department trying to work out a settlement and each time the Department position required the liner be removed and replaced.

## STATE ARBITRATION BOARD

Order No. 2-2007

The Contractor had a flow study completed to show the capacity was not decreased due to the liner installation and it was found the entire system was undersized prior to the start of this project. Finally the Contractor removed and replaced the liner to get the project accepted.

Following the hearing the Board deliberated and discussed the matter and reached the following decision. The Board found errors on both sides of the hearing.

The Board found fault with American Water, who was consulted by the Department during the pre-bid period as to the size liner required for the project, for not notifying that the pay item was not consistent with what information American Water had previously communicated to the Department. Furthermore, American Water submitted documents indicating what the Department had intended but not what the pay item note indicated.

The Board found fault with the Department in that the pay item note was misleading as to the actual size of the liner to be used. There would have never been an issue had the pay item had indicated the actual size of the liner to be used was to have been 56.89”.

**STATE ARBITRATION BOARD**

Order No. 2-2007

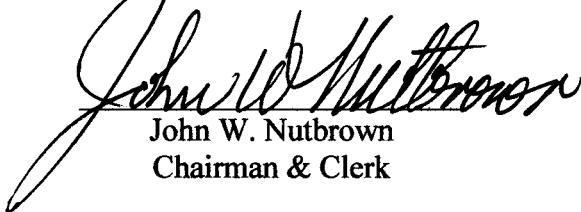

The Department is ordered to compensate the Contractor in the amount of \$178,610.00 which includes interest at the statutory rate since February 16, 2005.

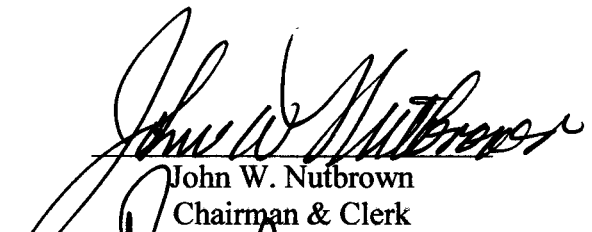

The Department shall reimburse the State Arbitration Board \$578.40 for court reporting costs.

PROCEEDINGS

CHAIRMAN NUTBROWN: This is a hearing of the  
State Arbitration Board, which was established in  
accordance with Section 337.185 of the Florida  
Statutes.

Ananth Prasad was appointed by the Board  
members and the Secretary of the Department of  
Transportation.

Mr. John Norton was elected by the construction  
companies under contract with the Department of  
Transportation.

These two members have chosen me, John Nutbrown  
to serve as the third Board member and act as the  
Chair.

Our terms will expire June 30, 2007.

Will each person who will make an oral  
presentation during the hearing please raise your right  
hand and be sworn in.

(Whereupon, all witnesses were duly sworn by the  
Chairman.)

CHAIRMAN NUTBROWN: A request for an arbitration  
of a claim submitted by the claimant, including all  
attachments thereto and the administrative documents  
preceding this hearing are hereby introduced as  
Exhibit 1.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

APPEARANCES:

MEMBERS OF THE STATE ARBITRATION BOARD:

Mr. John W. Nutbrown, Chairman  
Mr. Ananth Prasad  
Mr. John C. Norton

APPEARING ON BEHALF OF THE CONTRACTOR:

Mr. Mike Cannon  
Mr. Mark Harris  
Mr. Rich Nelson  
Mr. Tom Robertson  
Mr. Tim Schuller  
Ms. Lisa Schuller

APPEARING ON BEHALF OF THE DEPARTMENT OF TRANSPORTATION:

Mr. Mike Heffinger  
Ms. Pamela Miller

EXHIBITS	PAGE
Exhibit Nos. 1 and 2 in evidence	4
Exhibit No. 3 in evidence	13

CERTIFICATE OF REPORTER 78

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

Does either party have any other information you  
wish to put into the record as an exhibit?

MR. HEFFINGER: Yes. I was going to bring it up  
during my presentation.

CHAIRMAN NUTBROWN: If you have anything that  
not submitted previously --

MR. HEFFINGER: Pretty much this is based on the  
rebuttal of my rebuttal that was submitted to their  
claim.

CHAIRMAN NUTBROWN: Is there enough copies so  
each --

MR. HEFFINGER: I made five copies.

CHAIRMAN NUTBROWN: Let them look at it. I don't  
feel there should be any problem. Let them look at it.  
If everybody is happy, we will proceed from there.

That will be Exhibit 2.

(Whereupon, Exhibit Nos. 1 and 2 were received in  
evidence.)

CHAIRMAN NUTBROWN: I notice on this one sheet  
that part of it is cut off by the copier.

MR. HEFFINGER: Pardon?

MR. PRASAD: That was just the Web site.

CHAIRMAN NUTBROWN: This is all cut off, even on  
your original.

During the hearing the parties may offer such

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 evidence and testimony as is pertinent and material to  
2 the dispute being considered by the Board and shall  
3 produce such additional evidence as the Board may deem  
4 necessary to an understanding of the matter before it.

5 The Board shall be the sole judge of the  
6 relevance and the materiality of the evidence offered.

7 The parties are instructed to assure that they  
8 receive properly identified copies of each exhibit used  
9 in the proceedings. You should retain these exhibits.

10 The Board will send the parties a copy of the court  
11 reporter's transcript, along with our order. We will  
12 not furnish copies of any of these exhibits.

13 As is typical in arbitration proceedings, this  
14 hearing will be conducted in an informal manner. The  
15 Board is not required to apply a legalistic approach or  
16 strictly apply the rules of evidence used in civil  
17 court proceedings.

18 We are primarily looking for information in  
19 regard to the facts and the contract provisions that  
20 apply to the case.

21 The order of proceeding will be for the claimant  
22 to present their claim and then for the respondent to  
23 offer rebuttal.

24 Either party may interrupt to bring out a point.  
25 However, we will not tolerate talking across the table.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 So, anyway, my current position is vice-president  
2 of operations with them. I am still the senior person  
3 here representing American Water. And we brought  
4 Mike Cannon, vice-president of operations and  
5 Rich Nelson, who is the regional manager for the  
6 Orlando office where this project took place, and  
7 Tommy Robertson, the operations manager, project  
8 manager for this project.

9 Other than that, I am going to turn it over to  
10 Mike Cannon to start making the presentation.

11 MR. CANNON: Sure. Thank you, Mark. This was a  
12 cured-in-place lining project that American Water  
13 Services/Underground Infrastructures subcontracted with  
14 Schuller to perform for FDOT.

15 The plans, the bid item, description, the pay  
16 item description and notes all specify that 54 inch by  
17 25.5 millimeter thick liner in an elliptical pipeline.  
18 That is the exact liner that was ordered and installed.

19 The project -- we initially had notice to proceed  
20 in August of 2004. That was a pretty active season for  
21 Florida. If you will recall, we had four hurricanes  
22 between August and the end of September of that year.  
23 So, the project was delayed a number of times during  
24 that hurricane season.

25 The initial liners were actually installed in the  
CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 You will come through the Chair if you have anything.  
2 We want to keep it as orderly as possible.

3 Our court reporter, as I said this morning, has  
4 ten fingers, two ears, two eyes. If everybody talks at  
5 once, that damn thing is a scrambled mess. Just be  
6 courteous to both your own people and the opposite. We  
7 would appreciate your cooperation.

8 With that we will go ahead and open the hearing.  
9 There are no attorneys present, I assume. We will go  
10 ahead and open the hearing. American Water has placed  
11 a claim with the Board, even though it was remanded to  
12 the Board through the court, they applied for the  
13 hearing. So, American Water, go ahead and present your  
14 case and give us all the information you have.

15 MR. HARRIS: On behalf of American Water, I'm  
16 going to start. My name is Mark Harris. For the  
17 record I was the president of American Water Services.  
18 Just as a point of formality, American Water Services/  
19 Underground Infrastructures, has been recently  
20 purchased by the Lane Christiansen Company. We are now  
21 a subsidiary of Lane Christiansen.

22 If you check with the State licensing boards, et  
23 cetera, we are in the process of a name change to  
24 Inliner American. That is just a technicality. That  
25 was Inliner American.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 October 2004 time frame. There was two liners, a short  
2 liner of approximately 90 feet long. Then the second  
3 liner, making up a total of 529 linear feet of  
4 cured-in-place pipeline that was installed via an  
5 over-the-hole wet-out procedure.

6 Due to the diameter and the massive amount of  
7 resin involved, we had to bring our wet-out equipment  
8 to the site. The resin was brought in on tanker  
9 trailers.

10 The liners are wet out. As they are being wet  
11 out, they are going directly into the pipeline on site.  
12 It is a pretty extensive operation to line these  
13 pipelines.

14 The first liner was installed without incident.  
15 We were installing the second liner. It was actually  
16 completely installed when we were beginning to heat the  
17 water when FDOT's inspector came out and noticed a  
18 little bit of an annular space between the liner, not  
19 making contact with the host pipe.

20 He directed us to remove the liner at that point.  
21 We then instructed them that it would be very difficult  
22 to remove the liner once it was completely installed.  
23 We proceeded to process the liner out, FDOT noting that  
24 we were basically proceeding at our own risk.

25 After the liner was installed and processed out,  
CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 FDOT requested a meeting to talk about the -- that the  
2 liner was not as tight fitting as they had anticipated.  
3 Instructed that it was a maintenance project, they were  
4 trying to eliminate settling above the pipeline.

5 They were concerned of the thickness on the liner  
6 since it did not make full contact with the walls.

7 MR. HARRIS: Verify where it made contact.

8 MR. CANNON: When the liner is installed, it is  
9 initially making contact in the vertical position, both  
10 top and bottom. Once you get the frictional forces on  
11 the liner, it usually is tighter fitting in the narrow  
12 dimension and a lot harder for the liner to stretch out  
13 horizontally to the pipe walls.

14 Most of the annular space is to the side of the  
15 liner, with the liner fitting more top than in the  
16 vertical positions.

17 It was agreed we would go out and take several  
18 core samples from the liner to document the actual  
19 liner thickness as we were proposing to grout the  
20 annular space in accordance with FDOT specifications,  
21 which did instruct us to grout any annular space  
22 between the liner and the host pipe.

23 We presented those results back to FDOT. Upon  
24 reviewing that information, FDOT responded that  
25 basically they were concerned over the reduction in

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 Really there was nothing we could do at that  
2 point. Even if the liner had not been installed, the  
3 system was deficient. And it was at that point that  
4 DOT required us to remove the existing liner.

5 We submitted shop drawing submittals for the  
6 reinstallation liner because we still were not sure  
7 exactly what size liner it was that FDOT was wanting us  
8 to install. The results came back that it was not  
9 their responsibility to provide that size, it was the  
10 contractor's responsibility to properly size the liner.

11 We chose the size liner we thought FDOT wanted,  
12 installed the second liner. At that point FDOT  
13 accepted the second liner installation. We submitted a  
14 claim for about \$250,000 for the removal of the first  
15 liner that was installed in accordance with the plans  
16 and the specifications. Basically that represents our  
17 claim today.

18 CHAIRMAN NUTBROWN: Okay. Any other informatio  
19 you want to add at this point? You will have an  
20 opportunity later to rebut.

21 MR. CANNON: One of the pictures we submitted,  
22 there is a real concern over the sizing of the liner.  
23 This is the culvert that is immediately downstream of  
24 our liner installation. You will note it is a  
25 circular, round 54-inch reinforced concrete storm

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 flow capacity of the pipe system and they instructed us  
2 to remove the liner.

3 So, we had subsequent meetings to discuss the  
4 flow capacity issues. Pamela Miller prepared some flow  
5 calculations that basically demonstrated the original  
6 host pipe has certain capacity. The liner, if  
7 installed tight fitting as they anticipated, would have  
8 had a capacity. The installed liner had a capacity.

9 The condition of the pipeline prior to lining,  
10 because of offsets and concrete build-up, the joint  
11 seals that were in place, we actually increased the  
12 capacity of the system by about 20 percent from its  
13 prelined capacity, but they were concerned with the  
14 overall flow characteristics of the system.

15 They did suggest that we could do a flow study.  
16 The flow study documented that the installed liner was  
17 sufficient to handle the capacity of the system, and  
18 that they would then consider the grouting proposal  
19 that we originally presented and might consider letting  
20 us just grout the annular space, even though it was in  
21 accordance with the specifications.

22 We contracted with PEC Consultants, who prepared  
23 a flow study of the system. The results of the flow  
24 study came back and said the overall system was  
25 hydraulically deficient.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 sewer.

2 So, a lot of their arguments have been around the  
3 concern over not having the full equivalent elliptical  
4 size which is about 56.89 inches. Immediately  
5 downstream is a circular 54-inch RCP pipeline.

6 The other picture you are looking at is the  
7 reinstalled liner on the shorter section. I think  
8 that's the 90-foot section prior to sealing the ends of  
9 the liner.

10 MR. PRASAD: Did you give that picture out?

11 CHAIRMAN NUTBROWN: I don't have it.

12 MR. CANNON: Then you will note there is still an  
13 annular space even on the reinstalled liners. It may  
14 be a little more tight fitting. Just with these  
15 systems -- and particularly as you get larger in  
16 diameter, these liners tend to be not as tight fitting  
17 as say a smaller diameter liner.

18 Even though we may have reduced the annular space  
19 with the reinstalled liners that were accepted, there  
20 is still some annulus that is present.

21 The other picture is just a representation to  
22 show, you know, some of the concrete -- there are joint  
23 seals that we removed from the pipelines. That is part  
24 of the consideration as to why the pipeline prior to us  
25 lining it had a reduced, or a higher coefficient and

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 reduced hydraulic capacity.

2 What we did install and what they required to be  
3 removed did increase the capacity of the system from  
4 its prelined condition of about 20 percent.

5 We accomplished what they originally set out in  
6 their documents, reinforcing the existing structure,  
7 sealing off the joints. We actually increased the  
8 hydraulic capacity at the same time.

9 CHAIRMAN NUTBROWN: Okay. Let me interrupt.  
10 Cathy, would you make a note in the transcript that the  
11 three photographs furnished by American Water will be  
12 Exhibit 3.

13 (Whereupon, Exhibit No. 3 was received in evidence.)

14 MR. CANNON: Our other concern that we did  
15 express to them prior to removing the liner is that we  
16 felt their decision to remove the liner constituted  
17 economic waste. We did not see any real value in what  
18 they were requiring us to do when you considered all  
19 the factors.

20 CHAIRMAN NUTBROWN: Okay.

21 MR. CANNON: One of the other exhibits I provided  
22 were some flow calcs. In the letter I sent on  
23 January 23 I expressed a range of flow values using  
24 Boyle's original flow calculations. It shows,  
25 depending on which Manning friction factor you use and

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 turn.

2 MR. HEFFINGER: I'm going to use a lot of the  
3 exhibits. So, if you have this handy, I will talk  
4 about numerous exhibits as I go through.

5 I would like to go through in chronological order  
6 as to when the process started, when the plans were  
7 let, the preconstruction meeting, the initial  
8 installation of the liner and the subsequent removal  
9 and meetings that occurred.

10 I would like to start out by letting Pam Miller  
11 go over the process by which the Department would  
12 consult on issues such as this when coming up with  
13 potential solutions to resolve issues out in the field.  
14 I will let Pam talk about the process of the  
15 consultant.

16 MS. MILLER: That brings into capacity the whole  
17 capacity part. We were contacted by DOT. They have us  
18 do a study if there is an issue, a drainage issue. We  
19 were under contract to do -- it is a continuous  
20 maintenance contract, whatever they needed us to do.

21 We went out there. We looked at the conditions.  
22 We looked at video. We investigated several different  
23 options to rehabilitate that pipe.

24 When we did that, the way the process works is we  
25 have to do a report for DOT, cost out things. The

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 either the new condition of the pipe, had it been  
2 replaced with new pipe, the liner that was installed  
3 and removed, and then the unlined condition of the  
4 pipeline. You can see the different flow values based  
5 on those Manning friction coefficients.

6 CHAIRMAN NUTBROWN: Anything else, Mike?

7 MR. CANNON: Just that around February of 2004  
8 Pam Miller did contact our office. I believe she spoke  
9 with Rich Nelson. She was, you know, asking for design  
10 information on what thickness of a liner would we  
11 recommend to be installed in the pipeline.

12 We did recommend a 25 and a half millimeter thick  
13 liner which was the liner specified on the plans. We  
14 did provide information that in our opinion the  
15 equivalent circular -- circumference of a round  
16 pipeline for this host pipe conditions would be a  
17 56.89-inch liner.

18 The plans were still released with the pay item,  
19 bid item. The pay item notes indicate a 54 liner was  
20 to be provided. That information was available prior  
21 to plan preparation.

22 CHAIRMAN NUTBROWN: Okay. Anything else? We can  
23 come back.

24 MR. CANNON: Okay.

25 CHAIRMAN NUTBROWN: Mr. Heffinger, it's your

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 individuals that we work with like a matrix. We  
2 provided that in I think the exhibit that has the  
3 report, which would be Exhibit 17.

4 The second page kind of shows you the matrix.  
5 What we do is we give a report to those particular  
6 individuals. They review our recommendations. When  
7 they look at the matrix, they figure out what they feel  
8 is best.

9 Sometimes they go with our recommendation,  
10 sometimes they may not.

11 We had recommended the cured in place as compare  
12 to the removal and replacement in that area due to not  
13 wanting to disturb people.

14 They really would like to have removed the whole  
15 thing and replaced it because of the fact that, yes, it  
16 was leaking, and also they wanted to see, if they were  
17 going to spend that kind of money, what does it do to  
18 capacity.

19 In looking at it, for the difference in the  
20 price, cured in place was the option to go in that  
21 particular area. One of the things is it can increase  
22 the capacity.

23 If not, we were going to remove the whole thing,  
24 knowing that we are going to get back to the original  
25 capacity it was designed for.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 Everything we compared later on in our rebuttal  
2 is based upon what it would have been if we had removed  
3 and replaced. That was the option, remove and replace  
4 or cure in place so you can get that capacity and still  
5 cure the problem that they were having with the leaking  
6 and the asphalt driveway having problems.

7 We gave that to them. They told us to go ahead  
8 and do a removal and replace on one portion of the  
9 project and we were going to do the CIPP lining, then  
10 do the plans accordingly.

11 When we were working on the plans, initially  
12 we -- and in that process of the study, we did contact  
13 American Water. They did say that based on the  
14 groundwater conditions that they would recommend the  
15 25.5 millimeter thickness. They did talk about 56.89.  
16 However, we are not specing in our plans and specs that  
17 it's American Water that is going to be doing the  
18 project.

19 So in order to make the generic that any other  
20 company who does lining, who may have a different  
21 expansion ratio of their product -- I don't know their  
22 products, they know their products.

23 We wanted them to line the 43 by 68 with whatever  
24 liner it takes for you to line it and get it close and  
25 tight fitting per manufacturer's specifications, which

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 is what we have in the plans.

2 That was the direction. We gave a thickness,  
3 minimum thickness. It could have been more than that,  
4 which is the reason for the cores.

5 If they had a problem that it was tight fitting  
6 and they had a little bit more of a thickness, then  
7 because we just specified a minimum thickness, that  
8 would have to be acceptable.

9 We did the plans. When we -- I presented the  
10 Department with the set of plans on March 15, the final  
11 set of plans. That had on there 43 by 68-inch pipe  
12 liner. That pay item has been obsolete. There is no  
13 such thing as a 43 by 68 pay item.

14 Pay items are on plans. That's exactly what they  
15 are. It's only how the contractor gets paid. The  
16 plans that are behind the pay item supersede and so do  
17 the specifications anything that a pay item note has, a  
18 pay item or pay item note.

19 I was instructed the contractor would be paid for  
20 it with a 54-inch liner. That is the pay item.

21 The note on there said that the 54-inch pay item  
22 is equivalent to the 43 by 68-inch liner to be  
23 provided. That means you provide the liner for 43 by  
24 68. You get paid for it as a 54.

25 If I was going to ask someone to put in there a

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 54-inch liner, there is no need for a note. I will  
2 then put a 54-inch liner.

3 We did not specify the liner size because that is  
4 up to the manufacturer because someone may have  
5 something different. That is not our position to put  
6 it. It is a thickness. It is this liner is to be --  
7 this pipe is to be lined, however way you get paid for  
8 it.

9 There are several examples. If you are regrading  
10 an area you could have an item called shoulder rework.  
11 You may not be on a shoulder, but that's how a  
12 contractor will get paid for it.

13 Pay items and pay item notes are a means of  
14 payment, not a means for design and construction.  
15 That's what the plans are for.

16 MR. CANNON: I would like to just add --

17 CHAIRMAN NUTBROWN: Wait a minute. Let them  
18 finish first.

19 MR. HEFFINGER: Anything else?

20 MS. MILLER: That's why --

21 CHAIRMAN NUTBROWN: One of the Board members  
22 a question.

23 MR. PRASAD: Go over that pay item, 43 by 68 but  
24 equivalent to 54.

25 MS. MILLER: It specifically says 54-inch pay

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 item is equivalent to the 43 by 68-inch liner to be  
2 provided.

3 MR. HEFFINGER: That will be Tab 9.

4 MR. PRASAD: Why would -- I am just asking a  
5 question. Why would it not be -- why would you not  
6 come to the deduction that maybe American Water came to  
7 that you were looking for a 54-inch liner, not a 54.89  
8 liner.

9 MS. MILLER: If it was a 54-inch liner I wouldn't  
10 have had a pay item note. I would have said 54-inch  
11 liner is what I wanted them to provide.

12 By putting the note and looking at the plans, you  
13 will see all that is to be provided -- do they have a  
14 complete set of plans? It says 25.5 millimeter  
15 thickness per manufacturer's instruction. So, what is  
16 your manufacturer and what do you have to provide to  
17 give me this thickness.

18 MR. PRASAD: What is the pay item description for  
19 431.1142?

20 MS. MILLER: That pay item is a 54-inch liner.

21 There is no pay item for an elliptical liner in the DOT  
22 system.

23 MR. PRASAD: That pay item says 54-inch liner?

24 MR. HEFFINGER: If you look on Tab 12 I have a  
25 copy of the obsolete pay item list that was made in the

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 letting in 2004. It shows there is no pay item for a  
2 43 by 68-inch liner but it does have liner for optional  
3 material 54.

4 MR. PRASAD: You actually, I guess -- I guess  
5 I shouldn't put words in their mouth. I guess it says  
6 44-inch storm sewer? Is that what it said? Is that  
7 what I am looking at? 431.142. Okay. Pipe liner,  
8 optional material, 54 inch. Okay.

9 MR. HEFFINGER: If you look on the page before  
10 that, that is our district maintenance, pretty much  
11 takes care of all our pay items.

12 MS. MILLER: He is the person who instructed me  
13 to remove from the March 15 drawings the pay item that  
14 said 43 by 68 and to put the 54 inch and to put the  
15 note so they knew that is how they would get paid for  
16 that 43 by 68.

17 MR. NORTON: If you knew that in theory a  
18 56.89-inch round pipe was needed to fill this, why then  
19 didn't you say in this pay item note that it's to meet  
20 the ASTM spec which says it will be tight fitting, et  
21 cetera?

22 MS. MILLER: That's why we put the per  
23 manufacturer's instructions, which would be tight  
24 fitting.

25 MR. NORTON: You have this note that could be

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 They specified it was 56.89 inches. So right  
2 then American Water knew that it would take an  
3 equivalent pipe of 56.89 inches to actually line the 43  
4 by 68-inch pipe.

5 The project was bid. Plans were put together.  
6 Schuller Contractors was the winner of the bid letting.

7 Now on Tab 6 we had our meeting on July 13.  
8 American Water submitted to Schuller this exact  
9 National Liner copy that states that they are aware  
10 that it would take an equivalent diameter of 56.89  
11 inches to line this pipe.

12 What they did is they sent it to Tim Schuller.  
13 Tim's representative signed off. If you will notice on  
14 the front of this, there is a stamp that says, "It has  
15 been determined and hereby certified that in all  
16 respects this submittal is in full compliance and  
17 conformance with the contract specifications."

18 Drawings, specifically it states drawings. If  
19 you will look it says you will have to line a 43 by  
20 68-inch pipe in the intent and scope of the plans.

21 So, Tim Schuller Contractors, Incorporated  
22 actually approved this and said -- they approved these  
23 standard specifications in these drawings.

24 So, what I'm saying is that American Water knew  
25 that they had to put in the 56.89 liner. Tim Schuller

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 construed to say we want a 54-inch round pipe. Why  
2 couldn't you have said right there that you need the  
3 AS -- needs to meet ASTM 12, whatever it is, to be  
4 tight fitting within the pipe, something to that  
5 effect, which would then tell you that maybe the 54  
6 didn't work?

7 MS. MILLER: I don't normally specify things in  
8 the pay item notes like that. It's normally a pay item  
9 note.

10 MR. NORTON: But you are telling us -- go ahead.

11 MR. CANNON: Can I just interject. According to  
12 Webster, equivalent means equal in value. You know, if  
13 you read that by a strict definition, the 54 inch is  
14 equal in value to the 43 by 68-inch liner size to be  
15 provided.

16 CHAIRMAN NUTBROWN: Go ahead, Mr. Heffinger.

17 MR. HEFFINGER: Pretty much what I want to start  
18 out is I will be representing some issues in here.

19 I would like to go to Tab 5. What this is is  
20 when Pam Miller -- Pam was looking to get some  
21 information about this process. She actually contacted  
22 American Water. American Water in their package that  
23 they talk about, in their discussion, that they  
24 submitted to Pam Miller the National Liner design  
25 sheet, which she used to format her thickness.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 said thank you very much. I know you are going to put  
2 in a 56.89-inch liner, but American Water signed a  
3 contract, their proposal for a 54-inch liner.

4 So, in reality they signed -- they knew they had  
5 to put in a 56.89-inch liner. Schuller Contractors  
6 knew they needed to put in a 56.89-inch liner. They  
7 signed a contract for a 54-inch liner.

8 So in reality Schuller should probably be on this  
9 side and American Water should be on this side because  
10 it is a contract issued between the contractor and the  
11 subcontractor.

12 MR. CANNON: The 54 inch in our proposal to  
13 Schuller comes off of your bid item description.  
14 Basically what we proposed was the same bid item  
15 description that is in the contract plans.

16 There again, there was no requirements for  
17 submittals on this project. We just provided the same  
18 information that we had previously provided to Boyle.  
19 There was no approval of those documents. It came back  
20 to American Water.

21 We installed the liner per the plans and contract  
22 documents.

23 MR. HEFFINGER: There was an issue that Schuller  
24 Contractors approved this bid and approved the National  
25 Liner sheet.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 What I would like to do now is forward to Tab  
2 No. 13. This is a letter from Tim Schuller -- from  
3 their attorneys representing Tim Schuller Contractors.  
4 I have some highlights.

5 It starts, "When you submitted American Water's  
6 proposal to Schuller it was done with the  
7 representation that the proposal was in conformance  
8 with the subject plans and specifications.

9 "If there was ambiguity in the plans, it was your  
10 responsibility to request additional information.

11 "Furthermore, once you began the installation of  
12 the liner and realized installing such liner required  
13 grouting in space, you should have immediately  
14 suspended the installation work and requested  
15 direction."

16 That didn't happen. So, when we get past this  
17 right here, we let the contract. American Water moved  
18 forward to put in the liner. They put in the first  
19 liner. Obviously they said it was without any issues.

20 The first liner was approximately 90 feet. There  
21 was no openings in which to see that there was any  
22 problems with that when they put it in.

23 So when they put in the second one -- we couldn't  
24 go inside the pipe because it was currently curing.  
25 The second liner they put in, my people were on site.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 accord. And on that Monday we had a meeting. We  
2 discussed various things, issues about what we could  
3 do. It was American Water's decision let's go out and  
4 core to see what our thickness is. Let's see what our  
5 depth is. That will give us an idea of grouting.

6 They moved forward at their own discretion in  
7 order to attempt to mitigate the issue that the liner  
8 was sizeably smaller than what was proposed.

9 So, then what we want to do is move forward.  
10 They submitted their grouting plan. It was reviewed by  
11 our district office.

12 It was reviewed by our district drainage engineer  
13 who determined it was not in conformance with the plans  
14 and specifications. It did not meet the intent of the  
15 contract, which was to line a pipe according to ASTM  
16 standards, 43 by 68 inch.

17 What we did then was during that meeting we  
18 decided to have them take that out. Now as soon as we  
19 decided that, we sent a letter saying you must remove  
20 the pipe.

21 Issues of pay items had never come up before.  
22 Issues of flow had never come up before. Issues of  
23 shrinkage had never come up before, and there had been  
24 no discussion to Manning's.

25 Initially there was an issue with the pay item.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 They noticed that there was some large annular spaces  
2 that they could see not only when they -- where they  
3 had the water tower where they input the initial liner  
4 but further down in another inlet it was open where you  
5 could see there was gaps.

6 We had our inspector and project manager  
7 Mike O'Riley, and he asked Mr. Robertson -- this isn't  
8 working, what is the problem. Mr. Robertson stated  
9 that, as in our dailies that is on Tab No. 15, just for  
10 reference, he stated they put in a 54-inch round liner  
11 in a 43 by 68-inch elliptical pipe. It doesn't add up.

12 At that point we called Tim Schuller. We  
13 requested -- we have an issue, there's spaces that  
14 shouldn't be anticipated in a cured-in-place liner.  
15 The annular spaces should not be anticipated.  
16 According to ASTM standards it conforms with the host  
17 pipe and is tight fitting.

18 We called Tim Schuller. He in turn contacted  
19 American Water as to -- our thing was you need to stop.  
20 What you have in there now is not working.

21 Whatever that conversation was between them and  
22 Tim, they called us up and said we will pursue, move  
23 forward. We will meet on Monday to discuss our  
24 options.

25 As Mike said before, we proceeded at our own

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 I think we discussed the pay item. There's been  
2 questions already asked. That was part of my  
3 presentation.

4 As stated by Ms. Miller, who was the engineer of  
5 record, item ten of that pay item says 54-inch liner  
6 pay item is equivalent to a 43 by 68-inch liner which  
7 was an attempt to use that pay item because the 43 by  
8 68 wasn't available. The State office decided not to  
9 create a new pay item.

10 Then we get to number two, the part of the flow.  
11 Pam Miller described that during the design of this  
12 project, it was determined that because the liner would  
13 be of increased capacity that we would use the  
14 cured-in-place liner. In order to bring our previous  
15 design up to as close as the original, which was  
16 approximately 72 cubic feet, that liner would bring it  
17 up to 70.817.

18 The liner in place pretty much only had 55.38  
19 cubic feet of surface.

20 If you look on the Tab No. 11, Tab No. 11 is  
21 American Water. They went out -- these are American  
22 Water's measurements. They measured the initial liner  
23 run.

24 What they did, if you see in about the middle of  
25 the page, after lining 61.46 by 39.39 inches, that is

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 an average of all those numbers they took from  
2 measurements, which is really not a good representation  
3 of the pipe.

4 The most restrictive measurement is going to  
5 result in the least amount of flow. The most  
6 restrictive measurement flow-wise is highlighted in  
7 this page. It's 61 inches by 37 inches.

8 When you compute the flow capacity of 61 by 37  
9 the flow capacity is 55.383 cubic feet per second.

10 Essentially instead of the claim of increasing  
11 the flow by 20 percent, flow has really only been  
12 increased by 8 percent, which is pretty much a 21.8  
13 percent reduction in what was inspected with the liner,  
14 if they had lined -- used appropriate size liner  
15 instead of a 54-inch liner for the 43 by 68-inch pipe.

16 So, flow was a consideration. We used that.  
17 Therefore, because they didn't achieve that flow,  
18 because they didn't conform with ASTM standards, they  
19 did not achieve what our expectation was, nor did they  
20 achieve what was expected from the plans. They didn't  
21 meet the contract requirements.

22 Then the issue came up. Now, like I said, these  
23 issues never came up before. The issue came up about  
24 the pay item, about the flow. Then another issue was  
25 brought up about shrinkage.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 thermosetting resins in general shrink when they cure  
2 or are cured. This has affected the cheaper liner  
3 form, may come away slightly from the surface which it  
4 lines. This has no dilatorius effect because the  
5 shrinkage is small."

6 As stated in the Net Composites, that shrinkage  
7 is point one six percent. We had shrinkage from 66  
8 inches, which was expected, to actually in one  
9 dimension was 59 inches. More than 8 percent. We had  
10 shrinkage on the height. What was expected was 41. It  
11 actually went down to 37, which exceeds 8 percent.

12 It highly exceeds the point one percent of the  
13 same Web site where industry standard was determined by  
14 American Water.

15 The industry standard -- there are chemicals out  
16 there that you can use that would shrink point one six  
17 percent. Therefore, shrinkage really is not a factor.

18 Then we get down to the fourth category that was  
19 brought up. We have the use of Manning's number. One  
20 step back on Tab No. 19. Appendix A was submitted by  
21 American Water in one of their submittals to us. It  
22 actually points out that brass and glass have a  
23 Manning's number of point zero zero nine.

24 Now, there are pictures, the next page, that show  
25 portions of the removed liner still in place, that show

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 Now I have passed out two papers. They are both  
2 from Net Composites. The first one has a graph on it.  
3 As you will notice, on the highlights -- as you have  
4 noticed on the highlighted area -- American Water  
5 presented this to us as justification for shrinkage.  
6 Vinyl esters can show shrinkage up to 8 percent.

7 Now prior to this, in our November 18 meeting we  
8 were discussing the issues of the liners. Mr. Cannon  
9 stated the topic of this is not the fact that we are  
10 wrong. We already know that. The issue is that we  
11 have provided you a product that is acceptable for  
12 industry standards.

13 This was sent to us as a justification for  
14 industry standards, vinyl esters should show shrinkage  
15 of up to 8 percent.

16 I went on the same Web site, Net Composites. On  
17 the same Web site they have a vinyl ester resin that  
18 states point one six percent after two hours post  
19 curing at 80 degrees centigrade.

20 So on the same Web site that was chosen to show  
21 the industry standard, there are products and industry  
22 standards showing shrinkage is really a nonissue.

23 If you look at Tab No. 21. On Tab 21 this is the  
24 In-Situ forms patent that they initially put out in  
25 1977. They actually state, "It is known that

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 wrinkles, that show an uneven surface. They do not  
2 show a smooth surface that resembles glass or brass  
3 whatsoever.

4 So, for them to assume that it would be  
5 acceptable to use a Manning's number of point zero zero  
6 nine, which is essentially perfect flow with no  
7 friction, is unacceptable.

8 If even if you look at this pipe in these  
9 pictures, point 01 is probably -- it is probably a  
10 stretch to use that as a Manning's.

11 So in our eyes the issue of a smaller Manning's  
12 coefficient is not an argument that can be presented to  
13 use because the pipe supplied was not equivalent to  
14 glass. It wasn't equivalent to brass.

15 The reason that American Water used to justify  
16 that we need to keep the liner in for flow, for volume,  
17 for shrinkage and for a Manning's number, the ultimate  
18 reason that the pipe did not fit was because they used  
19 a 54-inch liner and they were not -- they did not  
20 properly prepare the pipe in accordance with  
21 specification 431, which is on Tab 8.

22 Tab 8 specifically says, on Section 431-3,  
23 "Ensure that the host pipe is clean, dry and stable."

24 The pipe was not clean. It says to remove silt  
25 and other debris and dewater the hose pipe.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 In the following pictures that we have, I've got  
2 I think 14 pictures, it shows multiple areas where  
3 resin has actually fused and adhered to debris, silt  
4 and pipe clamps that were left in the pipe.

5 This liner was essentially flowed in through the  
6 host pipe with this material intact because it wasn't  
7 desilted, wasn't removed. There was silt present.  
8 When you move forward, there were bands that were left  
9 in the pipe. There were connecting bands left in the  
10 pipe.

11 If you look in the middle on the pages,  
12 specifically this one right here, there's actually  
13 bedding stone from where the pipe work was being  
14 constructed upstream.

15 Gentlemen, if you will look at this one  
16 specifically, those show where bedding rock actually  
17 washed down into the host pipe during construction of  
18 the concrete pipe upstream. Even that wasn't removed.

19 I will go back and readdress the issue when  
20 I finish my presentation. I would like to go step by  
21 step and address their rebuttal to my rebuttal for  
22 their claim.

23 So, essentially the reason that the pipe  
24 didn't -- the liner did not work wasn't because of  
25 flow, Manning's, shrinkage or any of the other

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 materials. It was because they did not meet their  
2 contract requirements.

3 ASTM Standard 1216 specifically states the liner  
4 will adhere to the host pipe. It specifically states  
5 it will be tightly fit. It cannot be tightly fit if  
6 the pipe is not desilted, debris is not removed and  
7 silt is not removed.

8 These pictures show that the resin that was  
9 initially placed in the liner adhered to the  
10 material -- rocks, bands, steel metal plates and silt  
11 to create an -- a barrier that actually made a tight  
12 fitting fit impossible.

13 So ultimately the claim was sent to the  
14 Department. This Department was sent to the District 5  
15 under Alan Highman.

16 They reviewed this claim with our district  
17 drainage engineer and district construction personnel.  
18 They determined this claim should be denied because  
19 they did not meet their contractual requirement.

20 The claim was then forwarded as a second phase to  
21 Tallahassee, which was reviewed by Sharon Holmes and  
22 two other members that she chose to be on the review  
23 committee. They in turn denied based on the fact that  
24 Schuller Contractors did not meet the intent of their  
25 contract.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 Now on Wednesday I received a rebuttal to the  
2 Department's rebuttal to American Water's claim. What  
3 I would like to do is address each one of these issues,  
4 since we haven't really had a chance to discuss these  
5 and address each one of these issues. Then I will  
6 conclude my presentation.

7 I would like Pam to talk about the first  
8 paragraph that regards section two of her engineering  
9 study.

10 MS. MILLER: That's just reiterating what I said  
11 in the very beginning about the fact that when the  
12 Department makes -- they take the matrix that I give  
13 them and they make their decision. Their decision was  
14 made to cure in place as opposed to removing the pipe  
15 in that area. They were removing the pipe in the other  
16 area.

17 Both of them were so that they could get back to  
18 the original capacity that the pipe had or as close to  
19 it. That is basically the first paragraph.

20 MR. HEFFINGER: The next paragraph I have already  
21 discussed, the 20 percent capacity increase was the use  
22 of the average liner dimensions.

23 Instead, the most restricted dimensions should  
24 have been used which was 61 by 37. Therefore, only the  
25 flow would result and it would be 55.383 cubic feet per

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 second. Therefore, it would be an increase of only  
2 8 percent.

3 In reality there was no increase. There was  
4 actually a decrease of approximately 22 percent from  
5 the design that was initially stated for the  
6 appropriate liner to be installed.

7 I have already talked about the issue of American  
8 Water takes issue with Mr. Heffinger's statement that  
9 they knew this was incorrect.

10 Mr. Cannon did say the issue here is not that we  
11 are wrong, we know that. The issue is we have supplied  
12 a product that is acceptable by industry standards.  
13 I have already described that issue.

14 On the next page there is discussion about the  
15 pay item. Pam Miller has discussed the pay item.

16 There's also as far as the contractor's  
17 responsibility to provide the proper liner size, which  
18 is true.

19 Tim Schuller approved the first liner. American  
20 Water approved it from their National Liner. National  
21 Liner was the material supplier for American Water.

22 There is really no way that the Department can  
23 approve a specific specialized product from a material  
24 supplier to a subcontractor to a contractor.

25 Tim Schuller approved the first one. He did

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 approve the 56.89-inch round liner. American Water in  
2 turn supplied the incorrect 54-inch liner.

3 So, the reason that we said that they need to  
4 have their manufacturer -- the manufacturer is the one  
5 that designs the liners for these pipes.

6 Pam Miller is the design engineer for the  
7 Department. She designed the project. It was American  
8 Water's responsibility to assure that their material  
9 supplier gave them the correct liner.

10 When they put in the correct liner, the correct  
11 liner -- I will get to that in a moment.

12 The next topic talks about the analysis was  
13 applicable, the rebuttal contained reference to liner  
14 pinch points. They don't reference pinch points.  
15 Pretty much if the pinch points were a problem in the  
16 initial liner, they should have been a problem in the  
17 second liner.

18 The first liner actually had the smallest  
19 dimension was 59 inches for the width and the height.  
20 The smallest dimension was 37.

21 In the second liner submitted and placed by  
22 American Water the smallest dimension was 65 inches.  
23 That was only in one spot.

24 The smallest dimension for the height was only 40  
25 inches. That was only in one spot.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 material. It would not have been adhered to the back  
2 of the liner material, would have been in disarray.

3 Now, the comment does say remove bands as  
4 necessary for installation. In order for you to have a  
5 tight fit with a host pipe, you've got to have --  
6 you've got to remove those bands. It doesn't say have  
7 a tight fit with the appurtenances inside the pipe. It  
8 says have a tight fit with the host pipe.

9 To leave bands inside without Department approval  
10 is contrary to ASTM standards. Therefore, it's not per  
11 contract requirements.

12 The pictures that are shown, it's -- it is  
13 claimed that the silt came in through groundwater  
14 penetration. The silt, the rocks came in from flow  
15 from downstream that would have been a fact, when all  
16 of the liner material was pulled out, contrary to the  
17 pictures in Tab 8, they are actually fused by the resin  
18 to the liner material.

19 The bands are fused to the resin. The silt is  
20 actually fused to the resin. The rock bedding used in  
21 the pipe upstream is fused to the resin.

22 So, the infiltration did not cause -- the result  
23 of these pictures is not cause for infiltration or  
24 flow. It's caused because it was there initially when  
25 the pipe liner was initially placed.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 These are dimensions that American Water took  
2 themselves. So, if there was a problem, they took  
3 dimensions at the same spot. The pinch point is really  
4 irrelevant.

5 If there had been a problem in the first  
6 installation, it would have been a problem in the  
7 second installation.

8 We have already discussed the Manning's, point  
9 zero zero nine issue.

10 I have showed you pictures that showed you that  
11 the liner is not like a piece of glass. It's contrary.  
12 It's exactly the opposite.

13 The issue with using the appropriate Manning's  
14 number is irrelevant.

15 I state that the pipe was improperly prepared for  
16 the -- prior to the first installation. All desilting  
17 work was performed. The CIPP liner removal, they left  
18 one seal in place. It was obvious by the picturing in  
19 Tab 8 that the joint seals were not removed.

20 If a -- if one joint seal was left if place, it  
21 would have resulted in actually two seals with a rubber  
22 gasket as shown in these pictures.

23 Each seal would have had -- it would have been  
24 symmetric in form when they pulled out the lining  
25 material. It would have been adhered to that lining

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 There is references that there was -- the  
2 Department did do some grouting out there. The  
3 Department did everything they could to try to  
4 alleviate the infiltration process and stop the leaks.  
5 That's why we have experts to do it because we couldn't  
6 figure it out.

7 Now they make reference to there is build-up of  
8 concrete because we tried to fix it. The build-up of  
9 concrete left -- resulted in the dimensions that were  
10 reduced from 66 -- should have been 66 by 41, and the  
11 smallest dimension was 59, smallest dimension was 37.

12 If that concrete had been built up, it would have  
13 been present in the final installation -- the final  
14 installed liner.

15 Like I said before, the smallest dimension in the  
16 final installed liner, the smallest dimension for 529  
17 feet was 65 inches. The smallest dimension for 529  
18 feet as far as the height was 40 inches.

19 There is no build-up. It would have shown in  
20 these last measurements. These measurements -- the  
21 first measurements were conducted by American Water.  
22 The second measurements were conducted by American  
23 Water and one of my inspection staff.

24 If American Water had noticed that they would  
25 have been smaller, they would have obviously taken

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 measurements where it would have shown to be the worst.  
2 That did not occur.

3 They make issue about the equipment charges.  
4 That was a generic statement. There may have been some  
5 that were concerned with the Blue Book. The DOT  
6 department of claims process says they must use Blue  
7 Book prices. I agree with Mr. Cannon there was some  
8 specialized equipment that they could use that would  
9 have to be investigated to determine if anything were  
10 to be awarded would need to be investigated.

11 They take issue with the flow study. The flow  
12 study was taken solely on American Water's discretion  
13 in order to mitigate their mistake of using the  
14 improper liner size and not complying with  
15 specification 431-3, properly cleaning and preparing  
16 the host pipe.

17 So, even -- that should not be paid for because  
18 it is an attempt at mitigation because they did not  
19 perform as the contract required.

20 I would like to address the 54-inch pipe.  
21 American Water submitted a drawing that shows a 54-inch  
22 pipe downstream. Yes, there is a 54-inch pipe  
23 downstream.

24 If you look in the roadway standards and  
25 specifications, it states specifically in the piping

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 We are not here to cause material waste or anything as  
2 such.

3 What we did is based on reduced price, I think it  
4 was 10.72 percent reduction. That was the actual  
5 deduction as far as flow capacity, which was still  
6 acceptable. We decided to accept this pipe. This pipe  
7 was 62.5 by 40 inches. So, we accepted that pipe.

8 So, I guess ultimately what we are looking at is  
9 the District V people have actually said that the claim  
10 had no warrants. Our State maintenance office, along  
11 with other State representatives, have said this claim  
12 bases no warrant. Tim Schuller signed a good faith  
13 estimate that said American Water would supply a  
14 56.89-inch liner. American Water did not supply a  
15 56.89-inch liner. They supplied a 54-inch liner.

16 They did not properly prepare the host pipe.  
17 I think the SAB should come to the conclusion it was in  
18 the best interest of the Department to increase the  
19 flow by 22 percent and requiring the removal of a liner  
20 that did not meet the specifications and was not  
21 installed per contract.

22 CHAIRMAN NUTBROWN: Does the Board have any  
23 questions?

24 MR. PRASAD: Do you want to ask now?

25 CHAIRMAN NUTBROWN: Go ahead.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 diagram that flow of a 43 inch by 68-inch pipe is  
2 equivalent to the flow of a 54-inch round. The reason  
3 for that being the fact that in a 54-inch pipe there is  
4 less of a wetted perimeter. There is less friction.

5 Even if there is a -- now if we lined a 54-inch  
6 pipe, there would be some reduction. We did not line  
7 the 54-inch pipe that is further downstream.

8 So the fact that there is a 54-inch pipe  
9 downstream is really irrelevant now. The 43 by 68-inch  
10 pipe is equivalent in flow to a 54-inch round.

11 American Water submitted a diagram that shows --  
12 this was the second replacement installation that  
13 shows -- in 431 it states in general about grouting  
14 procedures. This is where they would have been  
15 grouted.

16 It was determined that this one was not placed  
17 adequately. In order to proceed, we negotiated with  
18 Tim Schuller to accept this at a reduced rate.

19 The lining was better, material was better.  
20 There was not as many stretch marks or anything.

21 Even though we could not use a point zero zero  
22 nine, there was the potential for this to use a point  
23 zero one.

24 In order to, like you said, to work with  
25 contractors -- it is our job to work with contractors.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 MR. CANNON: I do have some rebuttal comments.

2 CHAIRMAN NUTBROWN: Go ahead and make your  
3 rebuttal comments, then we will ask our questions.

4 MR. CANNON: In the January 23 letter that  
5 I provided, I did provide a copy of a memorandum to  
6 Christine Webb from Dan Hobblett and Pam Miller.

7 In item number four --

8 MR. HEFFINGER: Excuse me, which letter is that?

9 MR. CANNON: That's the rebuttal letter to yours.

10 MR. HEFFINGER: Okay.

11 MR. CANNON: It talks about the existing pipe  
12 prior to its lined condition. Let's see. "In  
13 consideration given for the pipe and its condition  
14 prior to installation, offset pipe sections, bands at  
15 joints, grout at joints."

16 It's pretty much confirming that a lot of those  
17 other factors existed in the pipeline prior to us  
18 lining it.

19 Then further on the back of it she did prepare  
20 some of her calculations. I have highlighted where,  
21 you know, based on the dimensions and areas that we  
22 looked at, it was calculated that the liner capacity as  
23 installed was 61.79 cubic feet per second.

24 They confirmed that their opinion of the capacity  
25 of the pipe prior to lining it was 51.26 cubic feet per

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 second.

2 So, just as, you know, they stated in their  
3 initial design document curing pipe lining can increase  
4 the capacity of the existing pipe. That's pretty much  
5 what they are saying in this document, that we did in  
6 fact do that.

7 In our claim request that was submitted on  
8 November 16 under Tab 6, is DOT's standard  
9 specification for pipe liners, Section 431.

10 Under general, in the installation methods, it  
11 states, "To seal or grout the annular space between the  
12 interior of the host pipe and the exterior of the  
13 liner."

14 So, you know, that would seem to imply that, yes,  
15 there is going to be an annular space and grouting is  
16 an acceptable method within the FDOT specifications,  
17 post liner installation,

18 Later reference, cured in place, one of the  
19 problems I have with DOT's approach is they pick  
20 certain sections of the spec they want to use and they  
21 don't pick the other sections.

22 This was a bid plan -- a planned bid project. It  
23 wasn't performance based specification. There was no  
24 intent to clarify the specifications in the contract  
25 document. The only specifications refer back to the

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 of the liner or any of those concerns.

2 We have had core samples immediately after the  
3 liner, and they were inspected, and none of those  
4 issues were raised at that point in time.

5 As I explained, we had a very active weather  
6 season with four hurricanes hitting Florida prior to  
7 lining. This liner remained in service with unsealed  
8 ends, leaking joints from October into January when the  
9 liner was removed. There was a lot of debris and  
10 sediment that could build up during that time period.

11 There was never an issue until after they  
12 directed the liner be removed.

13 Schuller did submit our National Liner  
14 information submittals. They specifically requested  
15 the Department approve that information. Mike  
16 Heffinger told Tim Schuller he refused to approve those  
17 documents. Once again, there were never any approved  
18 documents that were submitted back to American Water.

19 The 54 inch in the bid item, in the pay item  
20 descriptions, the liner that was installed was per  
21 plans and was per specs. They could have clarified  
22 specifications, could have put a performance  
23 specification in.

24 If it was really the intent to have a certain  
25 requirement on the liner that was installed, and once

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 FDOT standard specifications.

2 On the resin items, I would like to note that  
3 they have provided information on the vinyl ester  
4 resin. It was a polyester resin that was utilized.

5 When the whole discussion of shrinkage came up,  
6 it was only for the purpose of trying to show that  
7 there's other factors that were going on here other  
8 than just the liner sizing.

9 The liner was installed, a 54 inch per plans and  
10 specs.

11 There's other components that add to that annular  
12 space, such as resin shrinkage.

13 If it was really the intent to minimize those  
14 factors, the epoxy resin as indicated on this sheet has  
15 the lowest amount of shrinkage.

16 Epoxy resin could have been specified for this  
17 project. However, epoxy resins are typically about  
18 three times the cost of polyester resins.

19 There's other things that could have been done to  
20 have limited the amount of shrinkage in the annular  
21 space, but that was not done.

22 We did talk about earlier the fact that we did go  
23 out post liner installation and perform core samples of  
24 the liners. They were inspected with Boyle on site.

25 There was no indication of the debris on the back side

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 again we just -- it is our opinion that the liner that  
2 was installed was per plans and specs. It is our  
3 opinion that its removal constituted economic waste.

4 We are requesting that the Arbitration Board  
5 review our claim in the amount of approximately  
6 \$250,000.

7 MR. HEFFINGER: I would like to rebut some of  
8 those statements if possible.

9 CHAIRMAN NUTBROWN: How about us asking some  
10 questions and then we will give you that opportunity.  
11 Jack?

12 MR. NORTON: You read specification 4-3 I believe  
13 it was?

14 MR. HEFFINGER: 431-3?

15 MR. NORTON: Yes. You neglected to leave out  
16 here that -- you said clean and dry and stable?

17 MR. HEFFINGER: Can I find that?

18 MR. NORTON: Yes.

19 MR. HEFFINGER: I'm there.

20 MR. NORTON: You said remove silt, other debris  
21 and dewater the host pipe?

22 MR. HEFFINGER: Yes.

23 MR. NORTON: It also says to the satisfaction of  
24 the engineer. Was the engineer not satisfied with the  
25 cleaning of the pipe prior to them installing the

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 liner?

2 MR. HEFFINGER: I guess I was the engineer.  
3 I wasn't present at that point. I think it is -- as  
4 the subcontractor, it is the responsibility of  
5 Tim Schuller to ensure that they perform the  
6 inspection.

7 MR. NORTON: No. It says to the satisfaction of  
8 the engineer. It's real specific.

9 MR. HEFFINGER: It says they are supposed to  
10 clean it. Now, I didn't go out there and inspect it  
11 physically myself.

12 MR. NORTON: And you were the inspector on the  
13 job?

14 MR. HEFFINGER: I had an inspector.

15 MR. NORTON: Did he go into the pipe?

16 MR. HEFFINGER: I don't think he did.

17 MR. CANNON: Another factor, on this project  
18 there were large voids on the outside of this pipeline.  
19 It was not the intent of the documents to correct those  
20 deficiencies until post liner installation. They came  
21 back and pressure grouted those voids after the fact.

22 So the one joint seal that was left in place, you  
23 know, we had this large void outside this one joint.  
24 It wasn't our requirement to seal those. It was the  
25 post grouting.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 MR. HEFFINGER: If a pipe clamp was left in  
2 place, it wouldn't be embedded in multiple pieces on  
3 the bottom of the removed pipe liner.

4 CHAIRMAN NUTBROWN: Wait a minute. Go ahead,  
5 Jack.

6 MR. NORTON: I guess for the contractor, you had  
7 National's information that said it was a 43 by 68  
8 elliptical. It was a 56.89 inch. Why then use a 54?  
9 I guess I will ask Mr. Schuller or American Water if  
10 you want.

11 MR. CANNON: That is what the plans and specs  
12 required to be installed. It was per plans and specs.

13 MR. HARRIS: Can I say something? I hope this  
14 might answer your question. The cured-in-place liner  
15 is not rocket science. It is a pretty simple system  
16 when you get down to it.

17 Like anything, it's a repair method. It's not  
18 like you dig and put in a brand new product. It is a  
19 repair of an existing system. You work within the  
20 confines of an existing system in an environment you  
21 can partially control but you cannot a hundred percent  
22 control.

23 That is the nature of the beast. Anybody that  
24 thinks you are going to go in there and put a liner in  
25 a pipe and have it look like a rifle barrel at any one

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 As per the plan notes in the section nine of  
2 their document and as stated in our letter, it does say  
3 remove bands as necessary.

4 It was felt, given the extent of the voids on the  
5 outside of that pipeline, that it was better to leave  
6 that band in place than to have to deal with the large  
7 voids on the outside of that joint. That would have  
8 been detrimental to the pipe lining.

9 MR. NELSON: I would like to say something on the  
10 inspector. The inspector they had out there, PSI  
11 Consultants, I was not there on site but our cleaning  
12 crew was. He was there with our equipment when the  
13 inspection was done.

14 MR. CANNON: PSI was out on the second one.

15 MR. SCHULLER: Stan was the one.

16 MR. HEFFINGER: Stan Gainey did the second  
17 inspection and made sure it was completed. I think  
18 they did an excellent job of cleaning the host pipe on  
19 the second installation.

20 MR. SCHULLER: The inspector did see the video of  
21 this pipe after it was cleaned.

22 MR. HARRIS: The first time.

23 MR. CANNON: It was a beautiful looking liner.

24 The surface condition of the first liner actually  
25 looked better than the second liner.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 time is not realistic.

2 In an arch pipe, you have a shape that is like  
3 this, wide around the bottom, arched at the top. We  
4 are installing a round, circular tube. You can imagine  
5 a balloon being blown up in an area like this. It is  
6 just a regular balloon in this elliptical arch-shaped  
7 pipe.

8 As it increases in circumference -- and it is a  
9 54-inch diameter, when it reaches -- starts to reach  
10 this diameter, this pipe is 40 some inches at the top.

11 As it expands, the top portion and the bottom  
12 portion of the liner, it hits the bottom and the top of  
13 the pipe first. You do get a friction involved in  
14 this. This is a felt material. That is like your  
15 socks saturated in resin.

16 It is a woven felt material. It is -- especially  
17 in a concrete pipe, there is a lot of friction involved  
18 in it.

19 As that pipe is starting to expand, and it hits  
20 the top and the bottom, it's -- the stretch that you  
21 would normally associate -- and is common in a  
22 cured-in-place product pipe, is inhibited at the top  
23 and the bottom.

24 What you are looking now as it is going out, the  
25 portions that are trying to get in here, into the side

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 areas, is to almost overexpand in order to completely  
2 fill an arch pipe like this.

3 In this particular case, it didn't quite make it  
4 to the ends. This is what we are dealing with.

5 When we are talking about loose fitting and  
6 annular fit here and everything, and the spaces we are  
7 talking about, we are talking about, for the record,  
8 this little drawing here, is the lower haunches of the  
9 pipe is what caused all the concern and the problems  
10 and is first what was brought to the DOT's attention  
11 when they saw this was the lower haunches of the pipe.

12 This is the area we are discussing. In this type  
13 of an installation, in an arched pipe, it is very  
14 common in our industry, in our business, that you do  
15 end up having a void in this area.

16 That void can be half inch. That void can be two  
17 or three inches depending on the specifics of that  
18 given installation because there are things in there  
19 that we just cannot control, no matter what you do and  
20 how much you do it.

21 One way of totally eliminating this is now to put  
22 in a larger or oversize or more material so that you  
23 have more material that can now fold into these corners  
24 here as it expands.

25 You talk about a 56 or a 58 or a 60-inch liner.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 talking about.

2 MR. HARRIS: There is no hiding it. Everybody  
3 saw it on the finals in the last installation.

4 The point I'm getting at is we have a lot of  
5 customers, and quite often in situations like this we  
6 are specifically asked to undersize a pipe so these  
7 folds and wrinkles don't wind up in the inverts of the  
8 pipe.

9 We do grant annular spaces. It is quite common  
10 in what we do. It is the preference of the owner and  
11 the engineer as to what they want.

12 Theoretically, if you went right by the drawings  
13 that were submitted and the total calculations that we  
14 did, I will admit here right now to do that, yes, the  
15 inside circumference should have been 56 point  
16 something inches. I'm looking at this, everybody  
17 picking out specs, he is doing it, we are doing it, but  
18 we are not reading the paragraph up top.

19 All the time, for a lot of customers, we will  
20 undersize the bags to ensure that the flow line, which  
21 is important, and the inside cosmetics -- and again  
22 affecting flow. We don't have these wrinkles and these  
23 voids.

24 Mistakes I think are mistakes on both sides here.  
25 All right. It would have been a lot easier if it

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 The larger you get in diameters like this, when you are  
2 filling in an arched pipe, the more chance you have of  
3 creating folds in the middle of the pipe where you have  
4 so much material it can't expand all the way.

5 What has happened is in this second liner, we  
6 have actual folds in the pipe. I believe one of these  
7 pictures that was passed out shows it.

8 Now you have so much excess material to try to  
9 get out into the haunches of the arched pipe that you  
10 have actual folds in the pipe like this (indicating).

11 It is very common for us and our customers --  
12 exactly (indicating on photograph).

13 MR. HEFFINGER: That's the 54-inch round, isn't  
14 it?

15 MR. HARRIS: He has the right picture. That is a  
16 section of the lined pipe there. That is the rib in  
17 the existing pipe looking down into the 54 inch.

18 That is a good example of what is in there now  
19 that wasn't in there before. A lot of times -- we  
20 install almost a million feet of pipe a year.

21 MR. HEFFINGER: Can I get a copy of that picture?

22 CHAIRMAN NUTBROWN: I thought you had one.

23 MR. CANNON: There's a couple of different  
24 versions of it.

25 MR. HEFFINGER: I just want to see what we are

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 hadn't been a 54-inch liner on the plans. Regardless  
2 of whatever the note said, and refer to this note here,  
3 and what we really meant is here, et cetera, at the  
4 same time we really should have looked at it and said  
5 maybe we should call them, if we had picked it up.

6 In putting in the job, with the hurricane delays,  
7 and there's lots of things we can use as excuses. And  
8 I'm not making excuses, I'm stating facts. The point  
9 is when the pipe was ordered, when it came time to do  
10 it, somebody looked at the plan and it said 54-inch  
11 bag.

12 There wasn't anything that was that odd about it  
13 that would trigger and say, oh, that's a mistake, I've  
14 got to call somebody.

15 It's not like it said a 36 inch or we are not  
16 putting in a 64 or 72 where somebody might look at it  
17 and say that doesn't make any sense. A 54-inch bag in  
18 this specific case is not uncommon. It does make  
19 sense.

20 Whatever the intent was of the DOT -- and I'm  
21 sure their intent was proper and fine -- it's not  
22 something that we would have easily picked up.

23 If someone had really sat down and went back all  
24 through it, we might have said maybe we can squeeze an  
25 extra two or three inches in there in a bag. But the

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 end result that we did -- when we did it exactly by the  
2 book the second time, with the DOT inspectors crawling  
3 all over us, with people from National Envirotech  
4 crawling all over us and everybody going do it this  
5 way, do it this way, raise your head on your towers --  
6 we were under complete direction of a bunch of masters.

7 We have a product in the end that has an annular  
8 space and ribs and folds on the inside of the pipe.

9 That's the first time I heard that the second  
10 liner was negotiated at a reduced price. I am totally  
11 not aware of that. The only thing Mr. Schuller didn't  
12 pay us for the liner installation was the liquidated  
13 damages that was charged.

14 So maybe he just wanted to end the process.  
15 That's fine. That's between Mr. Schuller and the DOT.

16 We weren't aware of that. I probably wouldn't  
17 have stood for it other than the fact that I will say  
18 this now, in an effort to try to end all of this way  
19 back when, on the first liner we offered to reduce our  
20 price -- just grout it and reduce the price.

21 The point we are trying to make is what you had  
22 may not have been exactly what you wanted, what your  
23 intent was, what you thought you understood that we  
24 understood.

25 The point is that it was a perfectly fine product

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 that served the purpose, that really the main issue  
2 there was to close off the voids, to stop the leaking,  
3 to stop the sand from running in the pipe and having  
4 the parking lots cave in.

5 We did increase the flow over the existing pipe  
6 that was there, maybe not to extent of the new pipe.

7 The point is that liner was good looking. It had  
8 a smooth invert in it. The point is that we had to  
9 spend \$250,000 because it was -- to close the inch on  
10 the corners of the -- the bottom corners of the arch  
11 which to us was totally ridiculous. We did everything  
12 we could to try and solve this problem.

13 I think that's -- the DOT can say whatever else  
14 they want to say about it. We are done with our  
15 arguments here.

16 Whatever the Board decides on this is what is  
17 going to stand. That's going to be the end of it for  
18 us.

19 They can say whatever they want. We can go back  
20 and forth picking out little different pieces of the  
21 specifications or whatever. It was not what they  
22 wanted. It worked perfectly fine.

23 You know, we were willing to spend an extra  
24 \$50,000 to grout it and a pipe deduction. But 250,000  
25 plus dollars to do this, plus all the delays and the

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 liquidated damages I feel was uncalled for. That is  
2 why we are here.

3 Now the decision is up to you and whatever they  
4 want to say. We are done.

5 CHAIRMAN NUTBROWN: Mark, I have one question.  
6 When this liner is installed, how does it come out? Is  
7 it folded in half then slid in and expanded?

8 MR. HARRIS: If you can imagine your sock. It is  
9 a tube, your flat tube like your sock. On the outside  
10 in this case it has a polyurethane coating. The inside  
11 is layered felt in order to get up to the thickness of  
12 the wall.

13 Now it is coming out flat, with the intent to  
14 open it up like this. Probably the easiest way to do  
15 it is to do this (indicating).

16 Liner, felt, you pump your resin in here. You  
17 saturate the inside of the felt so that now your felt  
18 is actually just a medium to hold the resin.

19 Then you twist the ends, invert it basically  
20 inside out. Then it goes down in the pipe like this  
21 with a head of water.

22 So it comes out where the PU coating is now on  
23 the inside of the pipe. The saturated felt is on the  
24 outside. That is the inversion process for  
25 cured-in-place pipe.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 CHAIRMAN NUTBROWN: Okay.

2 MR. HEFFINGER: Did his question get answered  
3 before I proceed?

4 CHAIRMAN NUTBROWN: Did you get an answer to y  
5 what you wanted?

6 MR. NORTON: My question was on the satisfaction  
7 of the engineer. I guess I got an answer to that.

8 I've got one more. Specification 431-4.1. You  
9 said that the grouting was not normally done on these  
10 things, that that spec was a general spec for all types  
11 of pipe?

12 MR. HEFFINGER: Yes.

13 MR. NORTON: If that is the case, and it wasn't  
14 to apply to this pipe, why didn't you remove it from  
15 the specifications?

16 MR. HEFFINGER: It's a general spec because it  
17 actually -- it's the installation method. I didn't  
18 take out 431. That's included in the entire pipe liner  
19 section.

20 MR. NORTON: I agree, but if this doesn't apply  
21 to the type of pipe you put in, why didn't you take  
22 that particular section out of the specification?

23 MR. HEFFINGER: I think as they stated before,  
24 there was some irregularities on the ends that they may  
25 need to grout to actually make a smooth flow, to make

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 their pipe correct.

2 I would like to say that this is a general  
3 specification. When you do slip lining, they put those  
4 in, you grout slip liners --

5 MR. NORTON: We are not talking about slip  
6 liners. We are talking about this particular type of  
7 pipe. You have said in your presentation that grouting  
8 was not proper.

9 MR. HEFFINGER: Not expected --

10 MR. NORTON: Not expected.

11 MR. HEFFINGER: -- in a cured-in-place pipe.

12 MR. NORTON: If it is not expected, why leave  
13 that section in the specification?

14 MR. HEFFINGER: In a maintenance contract you put  
15 the whole specification in there. That's all I can  
16 tell you there.

17 CHAIRMAN NUTBROWN: Jack, do you have anything  
18 else?

19 MR. HEFFINGER: I would like to say a few things  
20 when you all are finished.

21 MR. CANNON: We do have some CDs in the car. We  
22 filmed the whole wet-out installation. I could go get  
23 those if you think it would be helpful to look at them.  
24 It would give you a better idea of the process.

25 CHAIRMAN NUTBROWN: Might help. When we are  
CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 MR. CANNON: We provided in Tab 11 in our initial  
2 claim toward the back a flow study that was done by  
3 In-Situ Quorum. It was actually Sverdrup Corporation  
4 who did this. That was on an installed liner in the  
5 field. It's titled "Research Demonstrates That The  
6 In-Situ Form Process Increases Flow Capacity In Gravity  
7 Flow Sewers."

8 CHAIRMAN NUTBROWN: Which tab?

9 MR. CANNON: It's Tab 11 in our claim document.  
10 It's right before the flow calculation for PEC.

11 This was conducted by ADS and Sverdrup  
12 Corporation. The In-Situ Quorum, the inventor of the  
13 process, they went out in the field, did it on existing  
14 concrete in the field, did it on existing installed  
15 cured-in-place liners.

16 Basically the results of their flow studies  
17 comparing existing concrete and cured in place compares  
18 an average for the cured in place of point zero one  
19 zero Manning, friction coefficient, and that of clay  
20 and concrete to point zero one five.

21 This is not design information from a manual or  
22 anything else. This is actual in the field studies.

23 It was always DOT's impression that the storm  
24 water drainage manual specifies you have to use a point  
25 zero one two Manning for concrete pipe. That is the

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 through.

2 MR. HARRIS: Make sure you give one to the DOT.

3 MR. NORTON: You talked about the intent of the  
4 specifications being to increase the flow of that  
5 originally expected.

6 MR. HEFFINGER: Yes.

7 MR. NORTON: Where does it say in the  
8 specification that is what you are going to do?

9 MR. HEFFINGER: It doesn't. That was part of the  
10 process where that method was chosen, that it more  
11 closely brought the final product to the design flow  
12 volume.

13 MR. NORTON: At one point you went looking for  
14 all the design calculations on the original pipe and  
15 you could never find them is my understanding.

16 MR. CANNON: Our consultant PEC went downtown  
17 looked for them.

18 MR. NORTON: I don't know how old that pipe is --

19 MR. HEFFINGER: It's 1977.

20 MR. NORTON: Would the specifications for that  
21 pipe at that time have had a higher Manning's or would  
22 there have been a difference in the design pipe at that  
23 time for flow?

24 MS. MILLER: Unless the DOT ever changed their  
25 Manning's, their design manuals always said point 012.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 Manning that will be used. We have no leeway to use  
2 any other Manning friction coefficients.

3 That's why in my letter -- I didn't really look  
4 at any one value. I looked at the range. I thought  
5 that was more representative to say there's a bunch of  
6 different reported values from low to high, so let's  
7 look at the range of the values.

8 I didn't want to sit there and say any one value  
9 was right or wrong, if you did compare, you know, the  
10 range of those values over those full ranges. I think  
11 I prepared in my letter. It's in the rebuttal  
12 document, how those values were -- would come out.  
13 They are very comparable.

14 Depending on which Manning value you used -- it's  
15 on page two of the January 23 letter. We have reported  
16 Manning values for cured in place of point zero zero  
17 nine which is lightly cleaned and in the In-Situ Quorum  
18 document up to point zero point two.

19 You can see the flow based on Boyle's  
20 calculations would have been anywhere from 75.52 cubic  
21 feet per second, using the lower range, and 56.4 if you  
22 use the higher of the range.

23 You take the same values. I'm looking at the  
24 installed concrete, the existing concrete pipe.

25 The point 012 DOT drainage manual value, the

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 72.62 cubic feet per second is all the way up to the  
2 known condition of the pipe with the offset joints and  
3 the joint seals of 51.26.

4 In comparison, the installed liner which was  
5 removed versus -- the range of, you know, the flows,  
6 all the Manning reported values are very consistent.

7 I wasn't about to, you know, try to figure out  
8 which one is the best one but show you the ranges are  
9 very similar.

10 MR. NORTON: Okay.

11 MR. HEFFINGER: Speaking of the Manning's flow,  
12 if you can turn to Tab 18. I did a spread sheet for  
13 flow, which is similar to what American Water did with  
14 their sheet. You will see where it says using the  
15 designs, we did. It's highlighted at 55.383.

16 Even if we used the Manning of point zero one,  
17 it's still roughly 61 cubic feet per second, which is  
18 unacceptable.

19 Even if we used Manning of point zero zero nine,  
20 which is zero friction and perfect, it's still -- still  
21 doesn't meet.

22 So, there was an effort made to consider the  
23 acceptance of the first initial installation. Because  
24 we couldn't get to -- 60 is just unacceptable.

25 MR. CANNON: It doesn't meet their unexplained

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 MR. NORTON: Was it a video of the pipe as  
2 cleaned?

3 MR. HEFFINGER: I can't recall if we have that  
4 video or not. I would like to think that we did.

5 MR. HARRIS: If the video is asking the question,  
6 one of you guys needs to answer it. Who looked at the  
7 pipe on the first time cleaning prior to the liner  
8 installation?

9 MR. SCHULLER: Was an inspector on the site all  
10 the time cleaning the pipe?

11 MR. NORTON: He watched the video after the pipe  
12 was cleaned?

13 MR. SCHULLER: He didn't go in the pipe. He did  
14 shine lights as we were cleaning. It was an extensive  
15 cleaning process.

16 MR. HEFFINGER: The second one for sure. I can  
17 attest my inspector was there. It took three or four  
18 days to actually prepare the host pipe. I know Mark  
19 was saying there was a one-inch gap. The largest gap  
20 in there, the smallest dimension was 59 inches. That  
21 left seven inches of gap which is a three and a half  
22 inch space gap.

23 It is very significant in our eyes. I think when  
24 we are looking at control factors, when they put in the  
25 second liner, my inspectors were there. My inspectors

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 intent which was never clarified in the documents.  
2 I have gone over Mr. Harris' recommendation.

3 MR. PRASAD: I have some questions.

4 CHAIRMAN NUTBROWN: Let Mr. Heffinger finish with  
5 his.

6 MR. HEFFINGER: I want to address the  
7 installation requirements. I think we addressed the  
8 general. Under the grouting, that's a general  
9 statement that encompasses not only slip lining but  
10 inverting. It encompassing pushing, pulling,  
11 spiraling, paneling, coating, bursting.

12 Like I said before, a cured-in-place liner it is  
13 not assumed there will be any annular space. However,  
14 as your question asked before, we left that in there.

15 The sediment pile-up that was referenced before,  
16 the pictures in section eight clearly document that  
17 pipe was not clean and the bands were not removed. The  
18 bedrock was not removed.

19 So I just want to state for the record that  
20 pipe --

21 MR. NORTON: Didn't you have an inspector watch  
22 the videos?

23 MR. HEFFINGER: The video was given after the  
24 fact when it was put in. It was provided at a later  
25 date.

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 are observers. They are not -- Tim Schuller is the  
2 contractor. He directs his prime. The manufacturers  
3 did come down. During the second phase, whatever they  
4 did different, that liner came out almost perfect.

5 If they had done the same thing the first time  
6 using the correct liner size, cleaning the host pipe  
7 adequately, the same result would have occurred.

8 MR. HARRIS: I know I said I wouldn't say  
9 anything. I will reiterate we think the first liner  
10 was better. That it would be better in the long term  
11 because the inside conditions of the pipe were better.  
12 We weren't happy with the second liner, but we did as  
13 we were directed.

14 MR. HEFFINGER: You realize I'm 180 degrees from  
15 that viewpoint. These are the same pictures. This is  
16 not a picture of the second liner installed.

17 MR. PRASAD: Let me ask American Water a second  
18 You did the preliminary work for Boyle Engineering.  
19 You sent information back and forth. At the time of  
20 bid did you know it was the same project you were  
21 bidding?

22 MR. HARRIS: No, we didn't. I will take that  
23 back. Who did the calculations?

24 MR. ROBERTSON: I did.

25 MR. HARRIS: I will ask you both. Did -- when

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 you got the information for the arched pipe and the  
2 size dimension and the water depth, did anybody specify  
3 this was for a DOT project number so-and-so at Grove  
4 Apartments? Did they do that to you?

5 MR. ROBERTSON: I don't recall they named the  
6 project. We talked on the phone.

7 MS. MILLER: I talked to Gordon Anthony, isn't  
8 that his name?

9 MR. HARRIS: He might not have transferred the  
10 information.

11 MS. MILLER: It was always told it was the Grove  
12 Park Apartments. It's -- the bands were described,  
13 all the methods that DOT had used to try --

14 MR. HARRIS: How long before the project was  
15 that?

16 MS. MILLER: It was just a couple of months.

17 MR. HARRIS: A couple of months. Do you know how  
18 many liner calculations we do on a daily basis?

19 MR. PRASAD: I am the one asking the question.  
20 Let me ask the question and you can answer.

21 MR. HARRIS: I apologize.

22 MR. PRASAD: My question was were you aware it  
23 was the Grove Park Apartments. You don't think so.  
24 She thinks she told somebody.

25 At the time of bid, when you have them coming to

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 was specified was marginally adequate to support the  
2 post grouting pressure conditions that were specified.

3 Throughout the project I raised concerns because  
4 I think Tim Schuller pointed out at one time I asked  
5 for what grouting pressure are you going to grout with,  
6 and he said 50 psi. And I said, whoa, and had they  
7 proceeded to grout with that kind of pressure they  
8 would have buckled this liner.

9 With those comments provided post, they did a  
10 very good job of very carefully grouting the second  
11 liner to avoid the possibility of buckling.

12 MR. PRASAD: The other --

13 MS. MILLER: I can answer your question earlier.  
14 In their submittal, if you go to Tab 2 it is a  
15 transmittal from me to Gordon Anthony specifically  
16 citing the Grove Park Apartments job prior to the  
17 contract documents being prepared along with the  
18 geotechnical investigation which clearly talks about  
19 what the project is. It is called the elliptical pipe  
20 replacement at Grove Park Apartments.

21 Yes, they did know about the project.

22 MR. PRASAD: When you submitted -- I saw the  
23 submittal. It was stamped. It also said 56.89 inches.  
24 I am assuming whoever signed the documents thumbed  
25 through it and saw that 56.89 inches, and you get a bid

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 you, and they say you know I sent something on Grove  
2 Park. It's 56.89 and DOT is asking 54. Wouldn't you  
3 think you would knock on the door and ask DOT, are you  
4 sure you want 54-inch liner or you want 56.89?

5 MR. HARRIS: You would hope that would happen.  
6 Like I said, we put in ten offices, a million feet of  
7 pipe --

8 MR. PRASAD: That's a good excuse. We have a  
9 thousand projects, too.

10 MR. HARRIS: I would hope it would have happened.  
11 Obviously the connection was not made.

12 MR. CANNON: I would like to point out that I did  
13 not become involved in the project until after the  
14 liners were installed. I had no prior involvement in  
15 it.

16 Mr. Nelson our manager has access to our software  
17 programs. He can run the design calculations. We make  
18 it available to most of our employees based on the  
19 information that is provided.

20 After I became involved in the project, I became  
21 very concerned with the design because we design for  
22 ground water buckling forces. This project had post  
23 pressure grouting of the voids around the liner and was  
24 not designed for the post grouting pressure conditions.  
25 The existing 25 and a half millimeter thick liner that

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 tab for 54 inches. Shouldn't that have triggered a  
2 question?

3 MR. CANNON: As Mr. Harris stated previously,  
4 it's not uncommon to undersize these liners. You try  
5 to improve the interior finish of the liners. That is  
6 not necessarily atypical. I would concur it is  
7 something that probably should have been raised at that  
8 point.

9 MR. PRASAD: The grouting of the annular spaces.  
10 You said it is normal to undersize the pipe. Even in  
11 the second installation did they have to grout the  
12 annular spaces?

13 MR. HEFFINGER: No.

14 MR. PRASAD: The specs allow for incidental  
15 grouting? You can't have a 50-inch liner in there and  
16 grout for four inches on either side, right? There is  
17 an optimal size for an elliptical pipe. That entails  
18 some amount of grouting.

19 MR. CANNON: The DOT specs actually say seal the  
20 ends, which we did, or grout in accordance with the  
21 specs.

22 If you don't grout the voids, what is going to  
23 happen is we know we have known leaking joints. Over  
24 time you are going to, with infiltration and  
25 exfiltration you are going to get movement of ground

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 water and soil regardless of however big that gap is.  
2 You may see some additional settlement above the lined  
3 pipeline to the extent those voids exist if they are  
4 not grouted.

5 MR. PRASAD: You brought up the issue about  
6 economic waste. Did I hear correctly in the first  
7 installation one of the inspectors saw something and  
8 said this doesn't look right?

9 MR. HEFFINGER: Yes.

10 MR. PRASAD: American Water said they will  
11 continue to do that at their own risk?

12 MR. HEFFINGER: Well, American Water did. We  
13 talked to Tim Schuller, who discussed the issue with  
14 American Water. It's not my place to direct a  
15 subcontractor. I deal directly with the prime. He let  
16 Mr. Schuller know. He talked to them, said they are  
17 going to proceed and we will meet Monday and discuss  
18 the issue.

19 MR. PRASAD: Between that time Monday to Monday  
20 what happened?

21 MR. HEFFINGER: They went through their process.

22 MR. PRASAD: Finished the whole process?

23 MR. HEFFINGER: Yes.

24 MR. HARRIS: At what point was the liner in the  
25 ground when they told us to stop?

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 then what we would have had would be a solid plug of  
2 resin in the pipe.

3 MR. PRASAD: You are saying you could not have  
4 stopped?

5 MR. HARRIS: Not at that point in time.

6 MR. PRASAD: What do the specs say about  
7 designing the size of the liner? You both have said  
8 the pay item says it is 54 inches, up to the contractor  
9 to design -- where does it say that?

10 MR. HEFFINGER: If I'm not mistaken, Florida 948  
11 on pretty much Tab No. 4 it gives you the specs for a  
12 cured-in-place pipe liner. It says a cured-in-place  
13 pipe liner shall be contiguous resin flexible tubing  
14 and meet ASTM 58.13 and 1216.

15 And 1216 is in that tab, states finished pipe  
16 fitting, pipe is found, takes the shape and fits  
17 tightly in the pipe.

18 That is where we gave the contractor direction to  
19 line that pipe. He contracted a sub who used National  
20 Liner to determine the size that would be appropriate  
21 to line a 43-inch pipe given the required thickness of  
22 24.4 millimeters.

23 So, ASTM gives you the direction that you have to  
24 make a tight fitting.

25 National Liner, American Water would -- we

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 MR. NELSON: I don't remember what time it was.  
2 Maybe lunch or one o'clock, I got a phone call to be  
3 out on the job site. I go out. There is an inspector  
4 from DOT, Michael O'Riley directing me to remove the  
5 liner because there is an annular space at the tail end  
6 of the pipe.

7 I walked down there with him to tell him the  
8 liner has shifted a little bit. It's a big liner.  
9 Water is going to go where it wants to go.

10 The liner has moved a little bit. It dropped  
11 off. We have a little bit bigger space over here than  
12 here. He says you have to remove it.

13 I said, Mike, we've been cooking. The water is  
14 hot. This is a thermal reaction resin. There's no way  
15 we can get this out right now.

16 MR. HARRIS: The liner was already inverted?

17 MR. ROBERTSON: Yes.

18 MR. HARRIS: We had already started to heat the  
19 water. The resin, when we do this, and fill it with  
20 water during this inversion process, you heat the  
21 water. That is what starts to make the resin hard.  
22 Once you start putting heat to the water, there's  
23 already a reaction started.

24 If we had started to pull that liner out and  
25 maybe got it halfway pulled out and that resin kicked,

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 discussed that with their material suppliers and their  
2 design engineer. They would format the correct size.

3 That's why we didn't specify a specific size.  
4 And maybe Pam can allude to the fact that different  
5 materials may expand at a different rate. One might  
6 need a 53-inch liner to expand to reach an elliptical  
7 56.89 equivalent. Another material might need other  
8 things.

9 ASTM by saying that it is tight fitting takes the  
10 shape of the host pipe, is dictating the dimension that  
11 needs to be supplied by the material.

12 MR. CANNON: If we had grouted it in accordance  
13 with the same specs, it would have been tight fitting.  
14 It was tight fitting at some sections, other sections  
15 it was not.

16 I would like to reiterate this was not a design  
17 built project, not a performance specification project.  
18 It was a plan and inspect-type project. The plans  
19 clearly showed the 54 inch.

20 Install the 54 inch, process it in accordance  
21 with ASTM 12.16. I believe we did that. We met the  
22 intent of the contract.

23 MR. HEFFINGER: I would like to state that the  
24 plans specifically state that is a pay item with the  
25 liner. It shows it numerous places, the 43 by 68-inch

CATHERINE WILKINSON & ASSOCIATES (850) 224-0127

1 pipe to be lined. If the host pipe would have been  
 2 cleaned and as dictated by 431-3 they would have  
 3 achieved the result of the second liner.  
 4 MR. PRASAD: That's all I have.  
 5 CHAIRMAN NUTBROWN: Do you have anything else?  
 6 MR. NORTON: No.  
 7 CHAIRMAN NUTBROWN: Do you have anything to add?  
 8 MR. HARRIS: We are done.  
 9 CHAIRMAN NUTBROWN: Okay. Mr. Heffinger?  
 10 MR. HEFFINGER: I think that's it.  
 11 CHAIRMAN NUTBROWN: The hearing is closed. The  
 12 Board will issue an order approximately one month after  
 13 receiving the transcript for the hearing. We will  
 14 proceed from there.  
 15 Gentlemen, thank you for your time.  
 16 (Whereupon, the deposition was concluded at 2:45 p.m.)
