Executive Summary

The traveling public wants smooth, safe, and long lasting pavements. Initial pavement smoothness has been shown to improve the overall pavement performance. The Florida Department of Transportation (FDOT) has developed smoothness specifications for the acceptance of asphalt pavements on high-speed facilities that incorporates smoothness results obtained with high-speed inertial profilers.

This report is a synthesis of statewide project smoothness data collected from January 2005 through December 2009. It provides the end user with basic statistics on the Ride quality of projects tested for Ride Acceptance (RA). The data analyzed herein consists of all lots greater than or equal to 0.01 mile and less than or equal to 0.1 mile in length.

The information presented herein is summarized on a statewide basis as well as by District, roadway system, friction course, contractor, and year. Contractor statistics are further summarized by friction course type and aggregate type. Users of the report are encouraged to return the customer service form included in Appendix A.

**** Title 23 U.S.C. Section 409, provides that this information provided to you is not subject to discovery nor is it admissible into evidence.**

Introduction

According to National Cooperative Highway Research Program (NCHRP) project 1-31, conducted from February 1994 to December 1996 and published as NCHRP Web Document 1, "Smoothness Specifications for Pavements," the importance of pavement smoothness to the travelling public is undisputed. Smooth-riding pavements provide comfort, allow more efficient movement of vehicles over the roadway, raise optimum travel speeds, maintain traffic flow, reduce safety hazards to users and their vehicles, and may increase fuel efficiency, leading to lower traveling costs to roadway users. Pavement smoothness also imparts a positive reflection on the construction and maintenance proficiency of the owner agency, be it a state agency, city, county, or toll authority. In addition, American Association of State Highway and Transportation Officials (AASHTO) pavement design models suggest that initially smooth pavements last longer than initially rough pavements, though this has never confirmed through long-term field investigation (AASHTO design equations are based on only 2 years of performance data).

FDOT RIDE QUALITY

Ride quality has been used by FDOT for evaluating new construction, overlay projects, special ride quality evaluations used for informational purposes, and for monitoring long-term pavement performance at the network level. To measure pavement ride quality, automated or manual methods can be used to measure roadway profiles from which a roughness value is calculated. Most states including Florida use high-speed inertial profilers to measure smoothness. The commonly used measures of roughness (or smoothness) are the International Roughness Index (IRI) and Ride Number (RN). Since 1998, FDOT has been using the RN for project level acceptance, and evaluation in accordance with American Society for Testing and Materials (ASTM) E1489.

The FDOT has worked very closely with the Federal Highway Administration (FHWA) and the construction industry to improve pavement smoothness on Florida's state highways. To this end, a smoothness task team was created with representatives from FDOT, FHWA and the paving industry to develop and implement non-contact profiler based smoothness specifications. Sub-article 330-12.6 of the FDOT Standard Specifications sets the requirements for Acceptance Testing for Pavement Smoothness by Laser Profiler.

RIDE QUALITY EVALUATION PROCESS

The Pavement Condition Unit of the State Materials Office (SMO) is responsible for conducting smoothness evaluation using an inertial high-speed laser profiler. Florida test method FM 5-549, "Laser Profiler Roughness Evaluation," provides the method by which a pavement is evaluated for smoothness using the longitudinal profiles recorded from each wheel path using an inertial profiler test vehicle.

The test vehicle is driven along the wheel paths of the pavement section to be evaluated and uses a system of three laser sensors and two accelerometers mounted in the front bumper of a full-size van. One laser is mounted in front of each tire to measure the longitudinal profile in the left and right wheel paths of the traveled surface. These 32 kHz lasers measure the vertical distance between the sensor and the pavement surface at an initial rate of 30 readings per inch as the vehicle travels at 60 mph. An accelerometer is mounted atop each of these two lasers to isolate the vehicle's vertical motion and thus provide a "zero" reference plane. The third laser, mounted equidistant from the two wheel path lasers, provides a height reading from which to calculate rut depth in each wheel path. The vehicle's data acquisition system uses the accelerometer data to provide a correction to the laser data, eliminating the effects of vehicle movement, and uses a Distance Measuring Instrument (DMI) connected to the vehicle transmission and recording the longitudinal distance traveled to summarize the corrected laser data into approximately 1 inch intervals. The exact interval is a function of each individual DMI's calibration settings. These summary values are then post-processed into exactly 6 inch intervals to generate a longitudinal profile for each wheel path, as well as a combined value for both wheel paths, and an average rut depth.

The laser profilers currently in use by FDOT are manufactured by International Cybernetics Corporation (ICC) of Largo, Florida. All of these profilers are owned by FDOT with the exception of one unit that is provided through a contract with Applied Research Associates, Inc. (ARA). Currently this profiler is the primary unit used by the SMO for the collection of project level smoothness data.

District project personnel may submit all requests for pavement evaluations using online request forms available at the SMO's website:

Intranet: <http://materials.dot.state.fl.us/smo/pavement/pavementhome.htm>

WHAT IS THE INTERNATIONAL ROUGHNESS INDEX?

In "Guidelines for Conducting and Calibrating Road Roughness Measurements", published by the World Bank in 1986 as Technical Paper 46, International Roughness Index (IRI) is defined as a mathematical transform (a property) of a true profile describing surface roughness that causes vehicle vibration.

The underlying IRI model is a series of differential equations that relate the motions of a simulated quarter-car to a road profile. The IRI is computed as a linear accumulation of the simulated suspension motion, normalized by the length of the profile. IRI therefore has units of slope, typically "in/mi" or "m/km", and is computed from a single longitudinal wheel path profile. It has a demonstrated strong compatibility with the equipment used to develop pavement management systems. IRI is sensitive to wavelengths between 4 and 100 feet and is most sensitive to wavelengths of 7 and 50 feet.

All data is analyzed according to ASTM E1926, "Standard Practice for Computing International Roughness Index of Roads from Longitudinal Profile Measurements".

CUSTOMER SERVICE FORM

Customer Service Form

In an effort to continuously improve our customer service, the Pavement Material Systems Section of the State Materials Office requests your input by filling out and returning this survey form.

(Optional)

Your Name: _____ Title: _____
Company/Office/Organization: _____
Address: _____ City/State/Zip: _____
Phone: _____ e-mail: _____

Please rate each of the following factors using the scale provided. A "1" corresponds to **Very Poor**, and a "5" corresponds to **Excellent**.

| | | | | | |
|----------------------------------|---|---|---|---|---|
| Usefulness of Content | 1 | 2 | 3 | 4 | 5 |
| Organization of Information | 1 | 2 | 3 | 4 | 5 |
| Clarity of Graphical Information | 1 | 2 | 3 | 4 | 5 |
| Format of Tables | 1 | 2 | 3 | 4 | 5 |
| Overall Value of this Report | 1 | 2 | 3 | 4 | 5 |

Please provide an answer to the following questions. Use an additional sheet(s) if needed.

What was the most useful/informative part of this report? _____

What was the least useful/informative part of this report? _____

What changes would you recommend to improve this report? _____

Detach and mail to:
