Index 20199 Build-Up and Deflection Data for Prestressed I-Beams (Rev. 07/13)

Design Criteria

AASHTO LRFD Bridge Design Specifications, 6th Edition; Structures Detailing Manual (SDM); Structures Design Guidelines (SDG)

Design Assumptions and Limitations

Use this standard in conjunction with Indexes 20010, 20036, 20045, 20054, 20063, 20072, 20078, 20084, 20096 and 20120.

Unless otherwise required as a design parameter, beam camber for computing the theoretical build-up must be based on 120-day old beam concrete.

Consider the effects of horizontal curvature with bridge deck cross slope when determining the minimum theoretical build-up over the tip of the inside flange.

For a given size and type of beam, beam camber and associated Dim B and Dim D will vary due to span lengths and beam spacings. Dim B and Dim D will also vary from span to span along the length of a bridge due to deck geometry. To provide for better aesthetics and potentially easier detailing of the supporting pedestals, where possible adjust the values of Dim B and Dim D over equal height beams in adjacent spans so as to allow the beam bottom flanges to line up. Dim B and Dim D do not necessarily have to be the same value for a single beam. See the following sketch:

AVOID WHEN POSSIBLE

BUILD-UP DETAIL SHOWING ADJACENT NON-EQUAL SPANS WITH DIFFERENT BEAM CAMBERS
Plan Content Requirements

Complete the following "Build-Up and Deflection Data Table for AASHTO Type II and Florida-I Beams" and include it on the superstructure detail sheets. See Introduction I.3 for more information regarding use of Data Tables.

NOTES: Work this sheet with Design Standard Index No. 20199.

Payment

Include estimated build-up concrete quantities with the estimated deck concrete quantities. Do not break out estimated build-up concrete quantities.

In the absence of more refined calculations, the following method to calculate estimated concrete build-up quantities may be used:

For Case 1, 2 & 3: \[ V = \frac{LW\left[C + \frac{(B + D - 2C)}{6}\right]}{27} \]

For Case 4: \[ V = \frac{LW\left[\frac{B + D}{2} + \frac{2}{3}\left(C - \frac{B + D}{2}\right)\right]}{27} \]

Where:
V = Total Volume of build-up per beam (CY)
L = Beam Length (ft)
W = Width of beam top flange (ft)
B; C; D = Build-up Thickness (ft)
