**GENERAL NOTES**

1. The Railroad Company will furnish and install all track bed (ballast), crossties, rails, crossing surface panels and accessory components. All pavement material, including that through the crossing, will be furnished and installed by the Department or its Contractor, unless negotiated otherwise.

2. When a railroad grade crossing is located within the limits of a highway construction project, a transition pavement will be maintained at the approaches of the crossing to reduce vehicular impacts to the crossing. The transition pavement will be maintained as appropriate to protect the crossing from low clearance vehicles and vehicular impacts until the construction project is completed and the final highway surface is constructed.

3. The Central Rail Office will maintain a list of currently used Railroad Crossing Products and will periodically distribute the current list to the District Offices as the list is updated.

4. The Railroad Company shall submit engineering drawings for the proposed crossing surface type to the Construction Project Engineer and/or the District Rail Office for concurrence along with the list of Railroad Crossing Products. The approved engineering drawings of the crossing surface type shall be made a part of the installation agreement.

5. Sidewalks shall be constructed through the crossing between approach sidewalks of the crossing. Sidewalks shall be constructed with appropriate material to allow unobstructed travel through the crossing in accordance with ADA requirements.

6. All asphalt shall be installed in accordance with Index No. 514 and Section 300 of the Standard Specifications.

7. The Department will participate in crossing work, that requires adjustments to rail outside of the crossing, no more than 50 feet from the edge of the travel way.

</tbody>
</table>

Notes:

1. Type R Crossings are NOT to be used for multiple track crossings within zones for an existing or scheduled future vehicular stop. Zone lengths are charted above.

2. Single track Type R Crossings within the zones on the chart may be used unless engineering or safety considerations dictate otherwise.
**Railroad Crossing**

**Typical Crossing Material Replacement at RR Crossings**

- Beveled Edge (1:4 Slope)
- Shoulder Pavement
- Edge of Travel Way
- Shoulder Line
- Pavement

**Half Plan**

**Curbed Roadways**

- Shoulder Pavement In Lieu of Curb
- Concrete Curb and Gutter
- Utility Strip
- Sidewalk

**Section View**

- Friction Course
- Overbuild
- Existing, Right Path
- Type SP Asphalt (500 lb/ST)
- Filter Fabric (Optional With RR Company)
- Ballast

**Vertical Roadway Alignment Through a Railroad Crossing**

To prevent low-clearance vehicles from becoming caught on the tracks, the crossing surface should be at the same plane as the top of the rail for a distance of 2 feet outside the rail. The surface of the highway should not be more than 3 inches higher or lower than the top of the nearest rail at a point 30 feet from the rail unless track super-elevation makes a different level appropriate. Vertical curves should be used to traverse from the highway grade to a level plane at the elevation of the rail. Rails that are super-elevated, or a roadway approach section that is not level, will necessitate a site specific analysis for rail clearances.
