# Index 450-299 Florida-U Beams Build-Up & Deflection Data

### **Design Criteria**

AASHTO LRFD Bridge Design Specifications; Structures Detailing Manual (SDM); Structures Design Guidelines (SDG)

#### **Design Assumptions and Limitations**

Use this standard in conjunction with Indexes 450-210, 450-248, 450-254, 450-263 and 450-272.

Unless otherwise required as a design parameter, beam camber for computing the theoretical build-up must be based on 120-day old beam concrete.

Consider the effects of horizontal curvature with bridge deck cross slope when determining the minimum theoretical build-up over the tip of the inside flange. Consider that the vertical curve geometry is along the effective alignment along a chord at the centerline of the beam, which may be different from the alignment parallel to the Profile Grade Line.

For a given size and type of beam, beam camber and associated Dim B and Dim D will vary due to span lengths and beam spacings. Dim B and Dim D will also vary from span to span along the length of a bridge due to deck geometry. To provide for better aesthetics and potentially easier detailing of the supporting pedestals, where possible adjust the values of Dim B and Dim D over equal height beams in adjacent spans so as to allow the beam bottom flanges to line up. Dim B and Dim D do not necessarily have to be the same value for a single beam. See the following sketch:

# **Plan Content Requirements**

Complete the following "Build-Up and Deflection Data Table for Florida-U Beams" and include it on the superstructure detail sheets. See Introduction I.3 for more information regarding use of Data Tables.

| LOCATION    |             | REQUIRED THEORETICAL<br>BUILD-UP OVER & LEFT FLANGE |                       |                         | REQUIRED THEORETICAL<br>BUILD-UP OVER & RIGHT FLANGE |                       |                         | NET BEAM<br>CAMBER                                 | NET BEAM<br>CAMBER                                  | DEAD LOAD<br>DEFLECTION | BUILD-UP |

## Payment

Include estimated build-up concrete quantities with the estimated deck concrete quantities. Do not break out estimated build-up concrete quantities.

In the absence of more refined calculations, the following method to calculate estimated concrete build-up quantities may be used:

For Case 1, 2 & 3  

$$V = \text{Left Flange +}_{\text{Right Flange:}} V = \frac{\text{LW}\left[C + \left(\frac{B + D - 2C}{6}\right)\right]}{27} + \frac{\text{LW}\left[C + \left(\frac{B + D - 2C}{6}\right)\right]}{27}$$
For Case 4  

$$V = \text{Left Flange +}_{\text{Right Flange:}} V = \frac{\text{LW}\left[\left(\frac{B + D}{2}\right) + \left(\frac{2}{3}\left(C - \frac{B + D}{2}\right)\right)\right]}{27} + \frac{\text{LW}\left[\left(\frac{B + D}{2}\right) + \left(\frac{2}{3}\left(C - \frac{B + D}{2}\right)\right)\right]}{27}$$

Where:

V = Total Volume of build-up per beam (CY)

L = Beam Length (ft)

W = Width of beam top flange (ft)

B; C; D = Build-up Thickness (ft)
