COMMENTARY

Sheet 1: Updated Note 1 for Concrete Barrier and bridge mount. Provided additional wiring detail, a reference to 715-002, and new information of where breakaway fuse holders fit inside of pole.

Added callout and new Note 3 to explain that the top of the concrete foundation is flush with the finish grade elevation on the side nearest to traffic lane. Added vertical tolerance.

COMMENTS AND RESPONSES

BLACK = Internal Review Comments **RED** = Standard Plans Response

COMMENT: Index 520-001 (curb & gutter) requires that the gutter be sloped into the roadway pavement (offset from the top 1-1/2") when adjacent to flexible pavement. My suggestion is to clarify this with a note, or to make reference to the detail in 520-001.

RESPONSE: The particular slope you've mentioned has not been present in Curb and Gutter Barrier standards for many years, but we'll log it for consideration. This comment is beyond the scope of the current revision proposals for 2021-22, so we'll log it for consideration in future publications.

No change at this time
