Vault

Vault is an enterprise MicroStation (CADD) file management application that allows Project Managers (PM) to store and retrieve project CADD files. The application exists as a desktop client and web-based version. The web-based version has limited capabilities. The web-based version does not allow the user to check out files to modify, it only allows for them to obtain copies of files.

Vault supplies PMs with a method to download project CADD files from an internal server to a local machine. Changes to project data on the local machine are synchronized with the internal server.

Vault Application Access

Vault access is administered by the Office of Information Technology & District CADD Managers. Internal staff will use their Active Directory username and password while external staff are limited to using the web-based version.

For more information about Vault please contact the Production Support CADD Office
