SYSTEMS INTERCHANGE MODIFICATION REPORT (SIMR)

SR 9/I-95 from Miami-Dade County Line to North of Griffin Road (SR 818)

Financial Project Identification Numbers: 439170-1-22-02

Broward County, Florida

Prepared for

Florida Department of Transportation
District Four

DRAFT REPORT

Updated April 2026

Volume 1 of 3

SYSTEMS INTERCHANGE MODIFICATION REPORT (SIMR)
Interstate 95 (I-95) / State Road 9 (SR 9) PD&E Study
From Miami-Dade County Line to
North of Griffin Road (SR 818)
FPID Number: 439170-1-22-02
ETDM Number: 14500

Florida Department of Transportation
Determination of Engineering and Operational Acceptability

Acceptance of this document indicates successful completion of the review and determination of engineering and operational acceptability of the Interchange Access Request. Approval of the access request is contingent upon compliance with applicable Federal requirements, specifically the National Environmental Policy Act (NEPA) or Department's Project Development and Environment (PD&E) Procedures. Completion of the NEPA/PD&E process is considered approval of the project location design concept described in the environmental document.

DRAFT

This document has been prepared following FDOT Procedure Topic No. 525-030-260 (New or Modified Interchanges) and complies with the FHWA two policy requirements. Appropriate District level quality control reviews have been conducted, and all comments and issues have been resolved to their satisfaction. A record of all comments and responses provided during QC review is available in the project file or Electronic Review Comments (ERC) system.

1.0 PROJECT OVERVIEW

1.1 Introduction

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study along the segment SR 9/I-95 extending from the Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). The PD&E Study limits extend along SR 9/I-95 for approximately 6.5 miles in Broward County, Florida. The project proposes to address deficiencies and improve safety and traffic operations at the existing interchanges and cross streets and enhance the express lanes along SR 9/I-95 from the Miami-Dade/Broward County Line to north of Griffin Road. Modifications are proposed at the three northern interchanges within the PD&E Study Limits - SR 818/Griffin Road, SR 848/Stirling Road, and SR 822/Sheridan Street. A location map for the project is depicted in **Figure 1-1**.

This Systems Interchange Modification Report (SIMR) was prepared to support the proposed modifications to the three interchanges referenced above. The limits of the SIMR extend from south of Sheridan Street to north of Griffin Road (covering the 3 northern interchanges of the PD&E Study). The SIMR documents results of the traffic analyses for the considered alternatives and provides an assessment of the proposed interchange modifications in accordance with the FHWA's Policy on Access to The Interstate System. The SIMR was prepared in accordance with the FDOT's policies and procedures and serves as part of the necessary documentation for receiving LDCA for the proposed project. An Efficient Transportation Decision Making (ETDM) process was completed for the project and the related National Environmental Policy Act (NEPA) study encompassing the three interchanges is being conducted concurrently with the SIMR.

This SIMR was prepared in coordination with the adjacent FDOT PD&E Study (FM No.436903-1-22-02) which is implementing modifications to the I-95 interchanges at Hollywood Boulevard, Pembroke Road and Hallandale Beach Boulevard. FDOT prepared a separate SIMR to support the interchange modifications associated with this adjacent PD&E Study and Location and Design Concept Acceptance (LDCA) granted by the Federal Highway Administration (FHWA) on October 8, 2025. Also notable is the 95 Express Phase 3C project which is currently under construction. This project is implementing express lanes along I-95 with direct connect ramps to and from I-595. Improvements proposed under these two adjacent projects are incorporated in the I-95 PD&E Study extending from Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02).

Modifications to the I-95 express lanes system (elevated braided ingress/egress ramps) are also being considered under the I-95 PD&E Study extending from Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). A separate Corridor Traffic Analysis Report (CTAR) will be prepared encompassing all six interchanges within the project limits and I-95 mainline segment extending from Miami-Dade/Broward County Line to north of Griffin Road. **Figure 1.2** depicts the limits of the PD&E study, the area of influence for this SIMR and the documentation of improvements within each segment.

The Applicant, Florida Department of Transportation (FDOT) District 4 requests the Federal Highway Administration (FHWA) approval of this SIMR for the implementation of the proposed modifications to the I-95 Interchanges at Sheridan Street, Stirling Road and Griffin Road, located in Broward County Florida.

Figure 1-1 Project Location Map

1.2 Purpose and Need

The purpose of this SIMR is to provide the required technical documentation for obtaining FHWA approval for the implementation of modifications to the I-95 interchanges (Sheridan Street, Stirling Road and Griffin Road) and mainline segments located within the limits of the SIMR. The primary need for these improvements relates to the following (see Section 4 of SIMR for more details):

Traffic Demand (primary)
The year 2021 Annual Average Daily Traffic (AADT) along the SR-9/I-95 project limits ranged between 265,00 vehicles and 286,000 vehicles (general use lanes and express lanes combined). Based on the traffic projections prepared for the project, the projected 2050 AADT is estimated to be between 303,000 and 333,000 vehicles per day. The proposed improvements will address existing and future traffic demand through to the design year 2050.

Operational Deficiencies (primary)
The SR 9/I-95 project interchanges, ramp terminals, and cross streets within the project limits are over-saturated. If no improvements are implemented the ramp terminal intersections at Sheridan Street, Stirling Road and Griffin Road will operate at LOS F by 2050. In addition, I-95 mainline segments within the area of influence of the SIMR will also operate at LOS F. The proposed improvements will alleviate these failing conditions.

Safety (primary)
A historical crash evaluation of the SR 9/I-95 project limits revealed a total of 5,716 crashes observed over a five-year period between 2018 and 2022. Seventeen (17) of these crashes resulted in fatalities and 85 involved serious injuries. The predominant crash types along the project corridor consisted of rear ends at 53.6%, followed by sideswipes at 23.8% and fixed object crashes at 11.0%. Lane departure crash types such as those involving barriers comprised approximately 8.5% of the crashes. The rear end crash types are higher than the Districtwide average of 32.1%. High rear end crash types may be correlated to congestion. FDOT's Target Zero initiative is to eliminate fatalities and serious injury crashes which are high along the study corridor. Lane departure crashes are also an emphasis area for the state which is a high crash type along the project corridor. The proposed improvements will enhance safety conditions along the project corridor.

In addition to the above needs, the proposed improvements will also support emergency evacuation, economic development, and modal interrelationships.

1.3 Project Description

The PD&E Study is evaluating the potential modification of existing entrance and exit ramps serving the Hallandale Beach Boulevard, Pembroke Road, and Hollywood Boulevard Interchanges within the project limits. Widening and turn lane modifications at the ramp terminals were evaluated to facilitate the ramp modifications and improve the access and operation of the interchanges.

1.4 Project Location

A location map for the project is shown in **Figure 1-1**. The PD&E Study limits extend from Miami-Dade County Line to north of Griffin Road, Broward County Florida. The limits of the PD&E Study are within the City of Hollywood, City of Dania Beach, Town of Pembroke Park, and City of Hallandale Beach. Six interchanges are within the limits of the PD&E Study - Hallandale Beach Boulevard, Pembroke Road, Hollywood Boulevard, Sheridan Street, Stirling Road and Griffin Road. The three northern interchanges (Sheridan Street, Stirling Road and Griffin Road) are within the limits of the SIMR which is the subject of this SIMR.

1.5 Related Projects in Study Area

This SIMR maintains consistency with the Broward Metropolitan Planning Organization (MPO) Adopted Metropolitan Transportation Plan (MTP, formerly Long-Range Transportation Plan or LRTP), Broward County Comprehensive Plan, Miami-Dade Transportation Planning Organization (TPO) Adopted LRTP and any approved Development of Regional Impacts (DRI) within the area of influence. The SIMR will also maintain consistency with the following specific projects:

- Broward Interchanges Master Plan (FPID# 432785-2)
- I-95 PD&E from Hallandale Beach Boulevard to Hollywood Boulevard (FPID #436903-1)
- I-95 FDOT District Four 95 Express Phase 3C Construction Project (FPID# 409354-2)
- I-95 FDOT District Four Corridor Planning Study (completed under FPID# 436903-1)
- I-95 FDOT District Six Planning Study (FPID# 414964-6)
- I-95 FDOT District Six PD&E Studies (FPID# 414964-7, 414964-8 and 414964)

Where the request is inconsistent with any plan, steps to bring the plan into consistency will be developed.

1.6 Applicant Information

Leslie Wetherell, P.E.
Project Manager
FDOT District Four

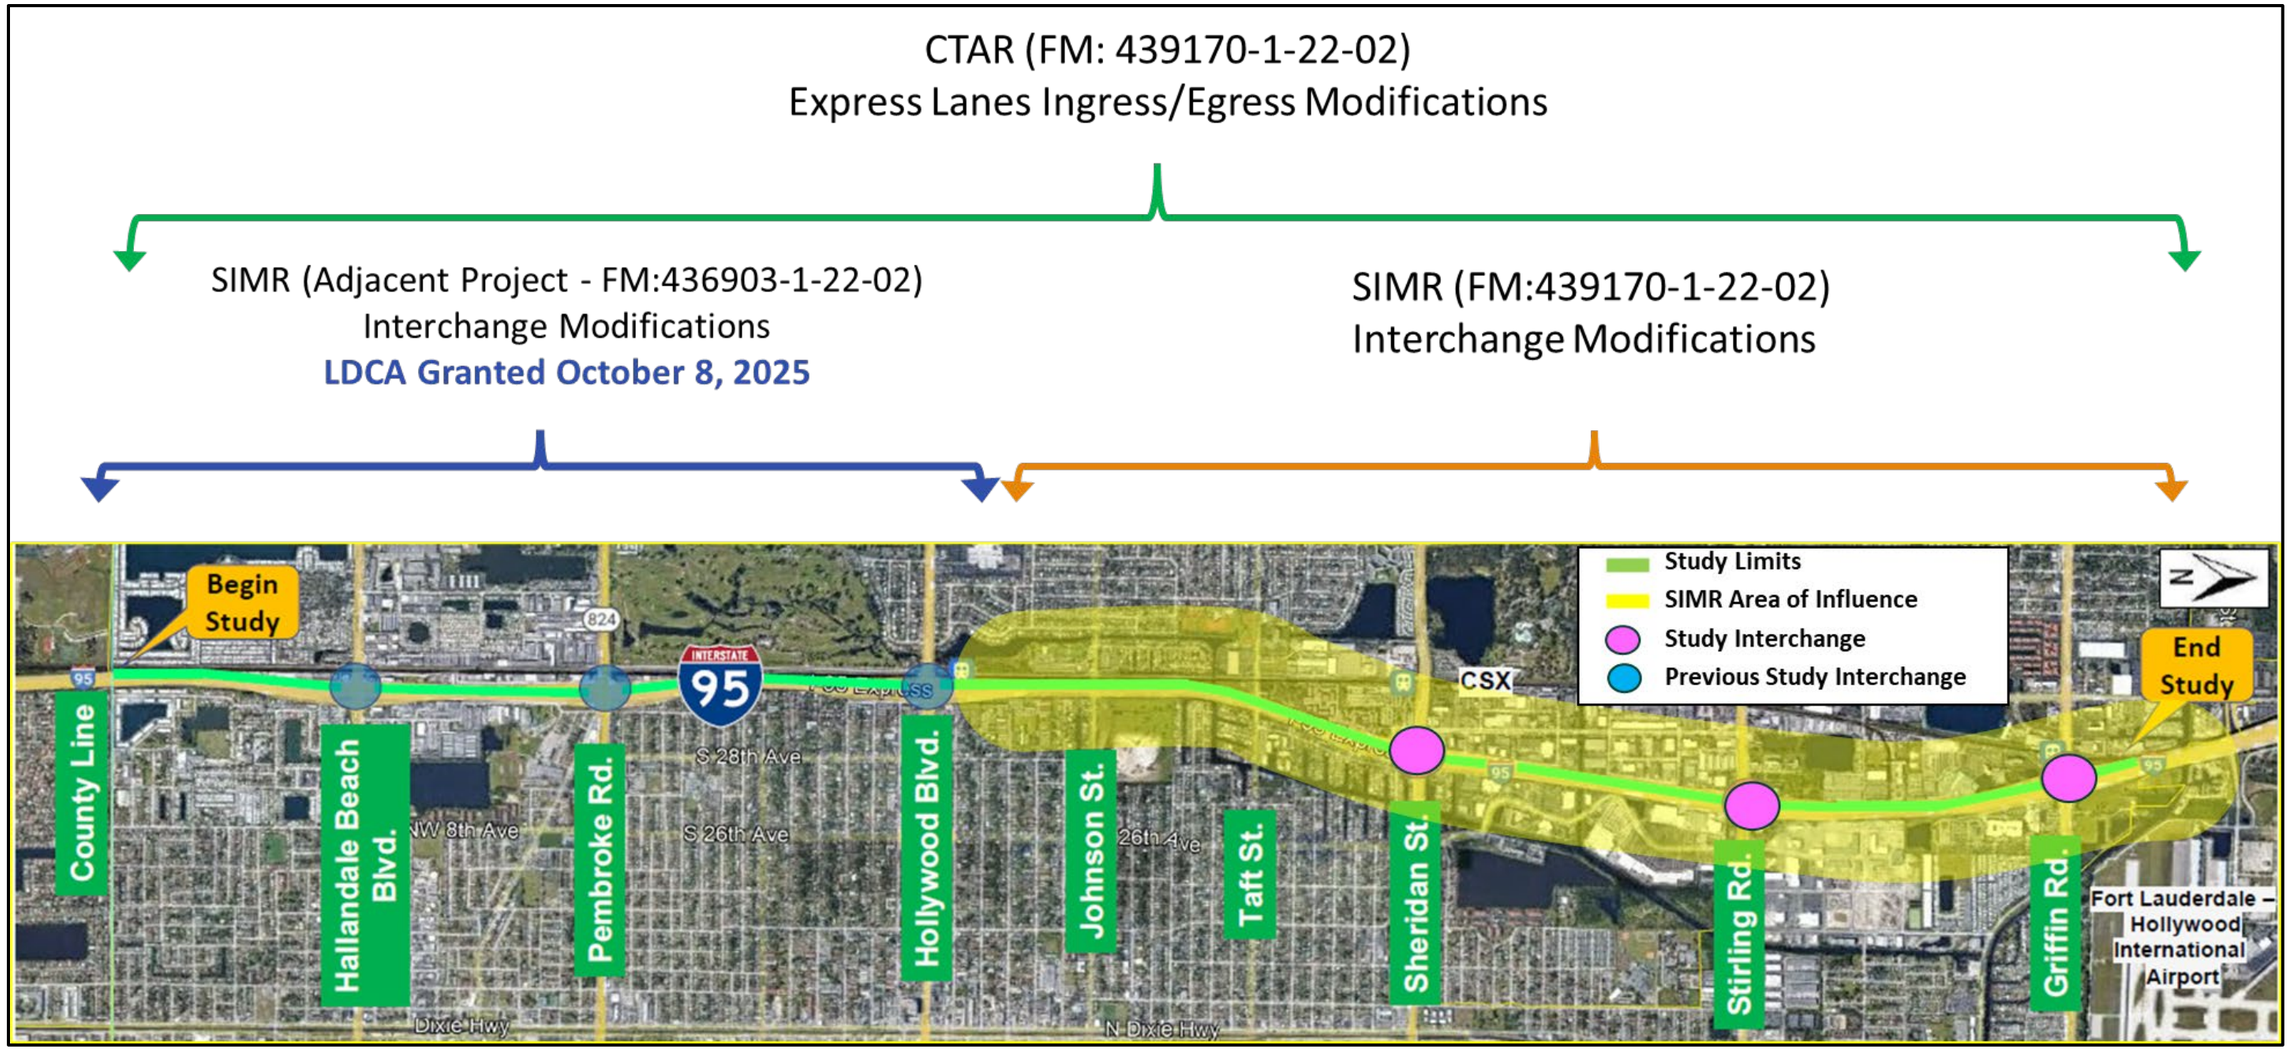
Figure 1-2 Project Location and Area of Influence



2.0 METHODOLOGY

2.1 Overview

A Methodology Letter of Understanding (MLOU) was prepared for this SIMR. The MLOU was approved by FDOT District Four Interchange Review Coordinator (IRC) and FDOT Central Office on October 10, 2023. The MLOU outlines the criteria, assumptions, processes, analyses, and documentation requirements for the project. A signed copy of the approved MLOU is included as **Appendix A**. The following sections summarize the methodology as set forth in the MLOU.

2.2 Area of Influence

The area of influence for the SIMR is depicted in **Figure 2-1**. It extends along I-95 from south of Sheridan Street to north of Griffin Road. The limits along I-95 include the ramps serving Hollywood Boulevard to and from the north and the ramps serving I-595 to and from the south. The ramp connections to I-595, within the area of influence, are not expected to have any impact on the I-595/I-95 Interchange. The area of influence includes three I-95 interchanges: Sheridan Street, Stirling Road, and Griffin Road. All freeway segments (merge, diverge, basic and weaving segments) within the area of influence were analyzed. The area of influence extends along each cross-street to include adjacent signalized intersections located within approximately 1/2 mile of the interchange. The signalized intersections within these limits are:

- Sheridan Street at N 29th Avenue
- Sheridan Street at N 28th Avenue
- Sheridan Street at SB I-95 Off-Ramp
- Sheridan Street at NB I-95 Of-Ramp
- Sheridan Street at N 26th Avenue
- Stirling Road at Anglers Avenue
- Stirling Road at NW 29th Avenue
- Stirling Road at SB I-95 Off-Ramp
- Stirling Road at NB I-95 Off-Ramp
- Stirling Road at SW 18th Avenue/Oakwood Boulevard
- Stirling Road at South Compass Way
- Stirling Road at Bryan Road
- Griffin Road at Anglers Avenue
- Griffin Road at SB I-95 Off-Ramp
- Griffin Road at NB I-95 Off Ramp
- Griffin Road at Old Griffin Road

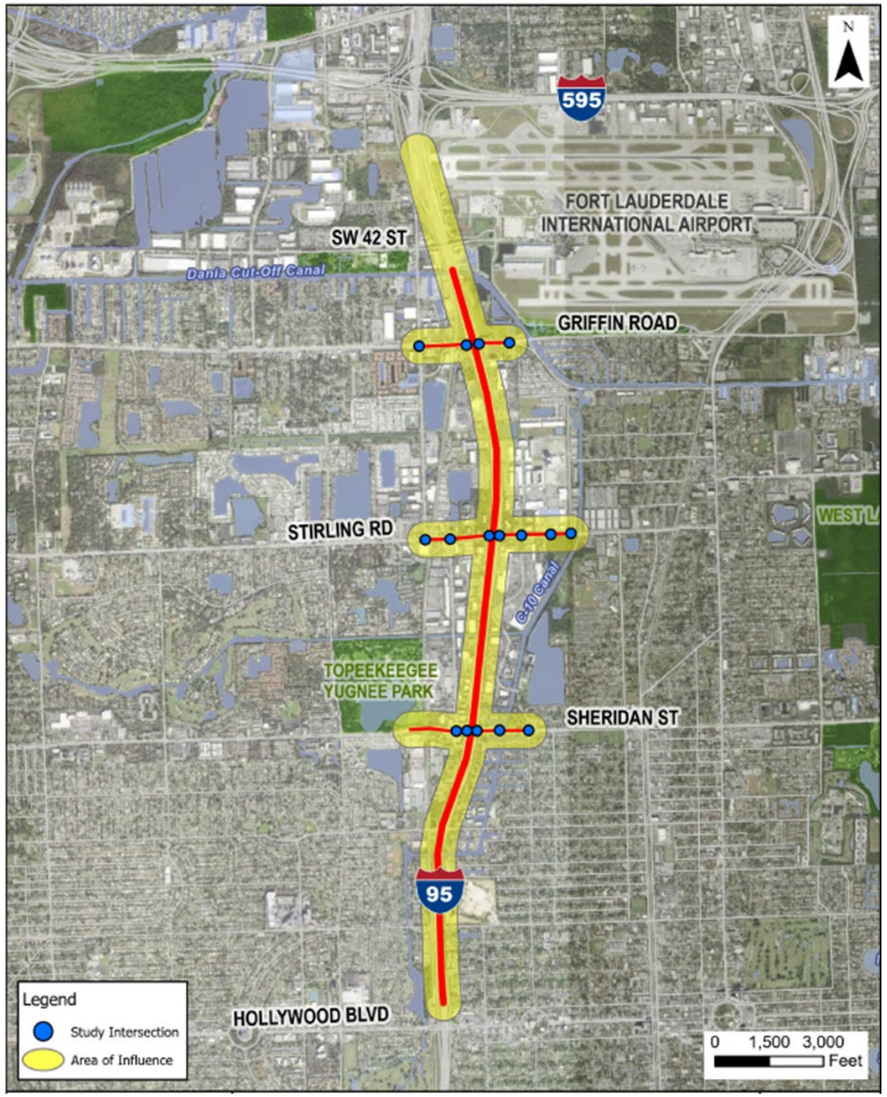


Figure 2-1: Area of Influence

2.3 Analysis Years

Travel Demand Model

- Base Year: 2015
- Horizon Year: 2045

Traffic Operational Analysis

- Existing Year: 2021
- Opening Year: 2030
- Interim Year: 2040 (Optional)
- Design Year: 2050

2.4 Data Collection

Several types of traffic data were collected for this study. Some of the primary data sources for the project included the following (a comprehensive list is included in **Appendix A**):

- ***Traffic Data Collection and Traffic Projections Report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, Updated May,2024***. This is the pre-work traffic information prepared by FDOT for the PD&E Study. This document served as the primary traffic data source for the project.
- Prior and other on-going studies conducted within the project area, most notably:
  - I-95 PD&E Study from Miami-Dade County Line to Hollywood Boulevard
  - I-95 Express Phase 3
  - I-95 PD&E Study from Golden Glades Interchange to Miami-Dade/Broward County Line.
- FDOT Roadway Characteristic Inventory Database
- Signal Four Analytics (Crash Data)
- FDOT Traffic Information Online
- Broward County Traffic Engineering (Signal Timings)
- Field Reviews

2.5 Travel Demand Forecasting

Travel demand forecast prepared by the FDOT for this project is documented in the ***Traffic Data Collection and Traffic Projections report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, May 20, 2022 (Updated May 2024)***. This report contains traffic forecasts for the existing year - 2021 (AM, PM, AADT) and AADT forecast for future years (2030, 2045, 2050) No Build conditions. The information contained in this report will be utilized in developing the forecasts for the Build Alternatives.

2.5.1 Selected Travel Demand Model(s)

The Southeast Florida Regional Planning Model (SERPM), Version 8.531, was used for the travel demand forecasting for this project. SERPM 8.531 is an Activity-Based Model (ABM) that simulates both household level and person-level travel choices including intra-household interactions with household members. SERPM 8.531 model is validated to year 2015 conditions and includes a future year 2045 scenario based on the adopted Cost Feasible plans from the Miami-Dade, Broward, and Palm Beach MPOs. It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies. The RTTAC-MS comprises representatives from FDOT District 4, District 6, and the three MPOs in South Florida.

2.5.2 Project Traffic Forecast Development Methodology

The AADT volumes were developed based on existing traffic counts and growth factors. The growth factors were determined from 2015 and 2045 model volumes, historical traffic counts, and socioeconomic growth in the study area. The AADT volume, applicable K factors, and D factors, together with existing turning movement counts will be used as input into the TmTool application to calculate future years turning movement volumes for No Build and Build conditions.

2.5.3 Validation Methodology

The SERPM 8.531 model was previously validated to year 2015 conditions following the standard model validation procedures, principles, and best practices in the industry. No further model validation task is required for this SIMR.

2.5.4 Adjustment Procedures

AADT projections were prepared by FDOT for the future years (2030, 2045 and 2050) under the No-Build conditions. Based on the coordination with the FDOT, the No Build conditions are defined as the transportation network with the inclusion of Cost Feasible Plan improvements in the adopted MPO 2045 Long Range Transportation Plan (LRTP). In addition, the preferred alternative from the I-95 PD&E study from Hallandale Beach Boulevard to Hollywood Boulevard is included as part of the No-Build conditions. The travel demand forecasts performed by FDOT included the following activities:

- **Data Gathering for Project Traffic from Past Studies:** The traffic projections and forecasts were gathered for the following three adjacent projects:
  1. I-95 PD&E Study from Hallandale Beach Boulevard to Hollywood Boulevard PD&E
  2. I-95 Corridor Planning Study led by FDOT District 4, and
  3. I-95 PD&E study from Miami Garden Drive to Miami/Broward County Line led by District 6.

- **Subarea Model Forecast for No-Build Conditions:** The socioeconomic data, network coding, and other model settings were reviewed to make sure they were consistent with the base year (2021) conditions. A future year (2045) No-Build Network in SERPM was developed based on the 2045 Cost Feasible Plans adopted by the three MPOs in the region. The No-Build network also included the proposed improvements from the aforementioned projects and was coordinated with FDOT.
- **Future Traffic Projections**: Trends analysis was conducted using historical traffic counts. The growth factors were calculated using the population and employment data obtained from the SERPM model. A set of recommended growth rates were proposed based on the trends analysis, socioeconomic data, and model volumes for all links within the study network. The growth rates were applied to the existing year (2021) AADT volumes to obtain projections for the future years 2030,

2045 and 2050. Coordination was carried out to ensure the AADT projections at the County line along I-95 were consistent with the AADT forecast prepared by the I-95 PD&E Team south of the Miami-Dade County line. Traffic volumes for the interim year (2040) will be developed by interpolating data from the FDOT's traffic projections.

2.5.5 Traffic Factors

Recommended traffic factors were developed for the study based on various considerations including:

- Peak/daily ratios computed from 2022 Florida Traffic Online (FTO)
- Traffic factors from previously approved adjacent projects
- FDOT's recommended range for traffic factors per 2023 guidelines.
- The FDOT's 2019 Project Traffic Forecasting Handbook (most current at the time of this study)
- Classification counts from 2022 FTO data.
- Existing Year (2021) traffic counts.

Based on the above considerations, recommended traffic factors were established for the project, as presented in **Table 2-1**.

Table 2-1 Summary of Traffic Factors

2.6 Traffic Operations Analysis

The operational analysis for this study was performed using Vissim version 2022-07, Synchro 12, and HCS 2024. Vissim microsimulation was used as the primary analysis tool to assess traffic operations on a network-wide basis for comparing No Build and the Preferred Alternative. In addition, it was used to assess the traffic operations of individual elements of the road facilities, such as freeway mainline, ramps, and ramp terminal intersections. HCS and Synchro were used for initial screening of potential build alternatives. Synchro was also used to streamline development of the Vissim models and to aid in signal timing optimization for future year scenarios.

2.6.1 Vissim Models

The calibration of Vissim models incorporated guidance and criteria from the 2021 FDOT Traffic Analysis Handbook. Prior calibration factors used for the adjacent I-95 PD&E study and I-95 Express Lanes projects were also reviewed. Traffic volume data, travel time data, and field observations were used in the calibration of the Vissim model. Vissim models were developed for the existing year (2021) for calibration and for the design year (2050) for comparison of the No Build and Preferred Alternative.

Vissim models were developed covering a total of 4 ½ hours in the AM and PM peak periods using 15-minute flow rates. The simulation periods included the following:

- AM Period: ½ hour seeding + 4-hour AM peak period
- PM Period: ½ hour seeding + 4-hour PM peak period

Several calibration measures were used to ensure that the model replicated the field conditions. The calibration process consisted of measuring and comparing volume, speed/travel time, and visual audits. Volumes, travel times, and speeds for freeway mainline and arterial (surface street) facilities were calibrated using criteria specified in the 2021 FDOT Traffic Analysis Handbook.

The major bottlenecks within the study area were calibrated to replicate the capacity and congestion based on field data. Visual audits of the simulation were performed to analyst's satisfaction to observe speed-flow relationships for individual links and acceptable queuing at intersections and other bottlenecks in the network. In addition to average travel speeds, individual link speeds and speed-flow diagrams were used to evaluate the performance of the network.

Vissim model outputs were gathered based on 10 simulation runs which were determined to be statistically acceptable based on 95% confidence level with allowable error of 10%. The driving behavior parameters from the South of Hallandale Beach Boulevard to North of Hollywood Boulevard SIMR calibration effort (southern three interchanges in the PD&E study area) were used as a starting point for this calibration effort. Any parameters that were changed from the default value were documented and justified accordingly. All future years Build and No-Build models were created from the calibrated 2021 existing model.

2.6.2 Measures of Effectiveness (MOEs)

The project study area is located within the urbanized area of Broward County. Hence, a target LOS D was used for all roadway facilities, per FDOT's Level of Service Policy. Measures of Effectiveness (MOEs) used to evaluate the performance of the considered alternatives were:

- Synchro Analysis
  - Level of Service – Overall intersection LOS and by movement
  - Delay – Overall intersection control delay and by movement
  - 95th percentile queue lengths
- HCS Analysis
  - Basic Freeway Segments – Density and LOS
  - Freeway Merge, Diverge and Weaving Segments – Density and LOS

- Vissim (Design Year only)
  - Freeway: volume, speed, estimated density and estimated LOS
  - Intersections: volume, delay, and max queue length
  - Network-wide: total travel time, total delay time, average delay, latent delay, vehicle-miles of travel, average speed, latent demand, vehicles arrived and total stops.

2.7 Safety Analysis

A safety analysis was performed to identify existing safety concerns as reflected in the crash data (2018 – July 2023). The analysis was conducted per guidelines contained in ***FDOT's 2022 Interchange Access Request User's Guide, Chapter 6 Safety Analysis Guidance***. The safety analysis incorporated a qualitative assessment as well as a quantitative assessment for the Preferred Alternative and No Build conditions. Historical crash records were gathered and summarized to identify crash characteristics such as: crash types, severity, lighting conditions, surface conditions, and weather conditions. The quantitative safety analysis was performed per the ***Highway Safety Manual (HSM)*** and using the ***Interactive Highway Safety Design Model (IHSDM***) for computations. The proposed improvements incorporate crash countermeasures, to the extent feasible, within the scope of the project.

2.8 FHWA Interstate System Access Policy

Effective December 2024, Title 23 Code of Federal Regulations Part 624 (23 CFR 64) was adopted as the new policy specifying requirements for the justification and documentation necessary to substantiate any proposed changes in access to the Interstate System (replacing the prior 2017 FHWA Policy Points – effective at the time the MLOU was signed). Accordingly, 23 CFR 64 is applied herein as the applicable criteria for justification and documentation of the proposed improvements resulting from the PD&E Study.

3.0 EXISTING CONDITIONS

The following sections provide a discussion and evaluation of the existing conditions within the area of influence for this SIMR. This discussion includes land use information, road network data, existing traffic data, traffic operations, and historical crash data.

3.1 Existing Land Use

The I-95 project corridor segment is located within Broward County and crosses four municipalities (City of Hallandale Beach, Town of Pembroke Park, the City of Hollywood, and Dania Beach). Land use was classified using data from the South Florida Water Management District (SFWMD), land use and cover nomenclature. The project corridor traverses a number of land use categories which are illustrated in **Figure 3-1.** In general, the project study area encompasses the following land uses:

- Commercial
- Industrial
- Mixed Use
- Public Lands
- Recreation
- Residential
- Transportation
- Water

The project is located mainly within an urban landscape (commercial and services) with the above land use comingled throughout. Notable land uses and transportation facilities within the project vicinity include:

- Fort Lauderdale/Hollywood International Airport
- Tri-Rail railroad which runs parallel and immediately to the west of I-95
- Sheridan Street Tri-Rail Station – located in SW corner of I-95/Sheridan Street Interchange
- Fort. Lauderdale Airport Tri-Rail Station – located in the SW corner of I-95/Griffin Road Interchange

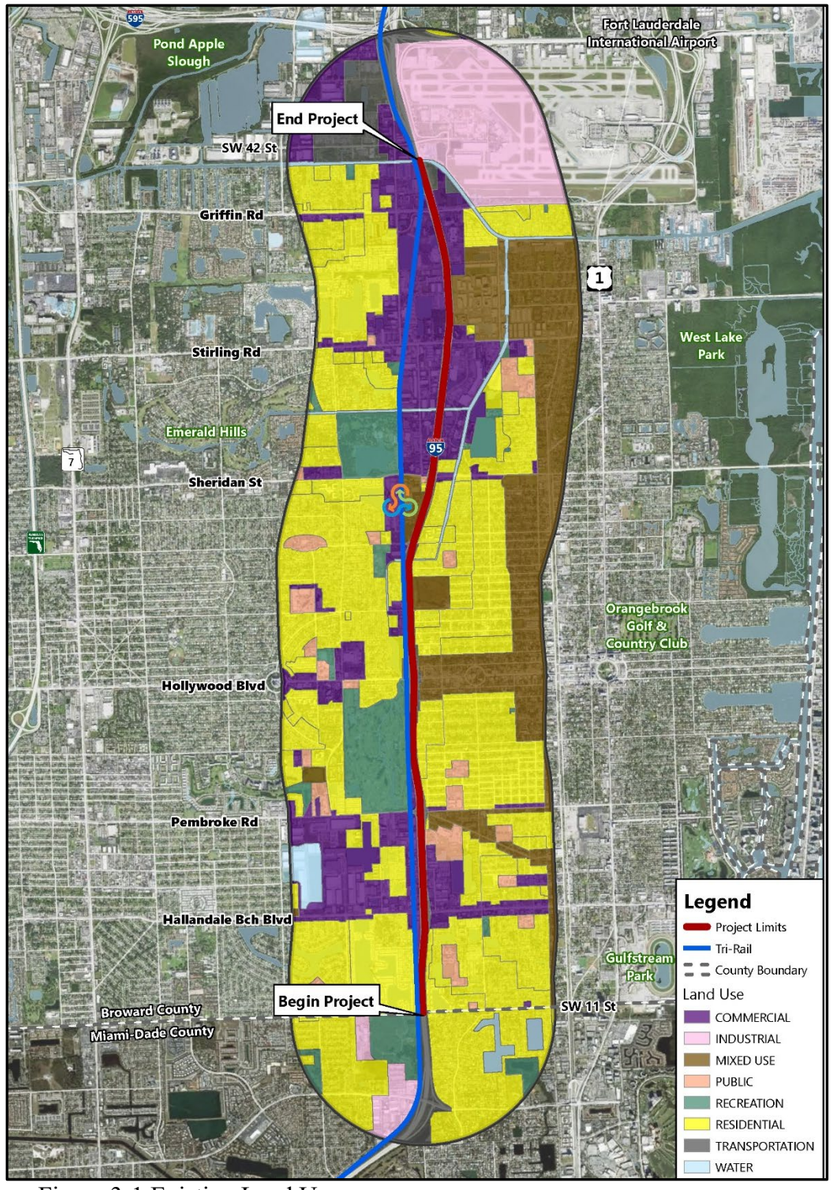

Figure 3-1 Existing Land Use

3.2 Existing Roadway Network

Figures 3-2 and 3-3 depict the lane configuration along I-95 mainline, the intersecting arterials (Sheridan Street, Stirling Road, Griffin Road) and the adjacent intersections within the area of influence (AOI) for the project. The associated roadway functional classifications and context class are shown in **Table 3-1**. Pertinent features of each roadway facility are discussed below.

I-95 - The existing (2021) I-95 mainline within the study area is a north-south limited access facility consisting of 8 to10 general-use lanes (including auxiliary lanes) and 0 to 4 express lanes (see **Figure 3-2**). It should be noted that during the existing year (2021), I-95 mainline was actively under construction implementing improvements proposed under FDOT's 95 Express Phase 3C Project. This project is widening I-95 mainline to implement express lanes (2 NB + 2 SB) through the limits of the SIMR. This is reflected in the future No Build road network discussed under Section 5 of the SIMR. The lane configuration depicted in **Figure 3-2** depicts interim conditions during the construction phase. The posted speed limit on I-95 is 65 mph and lane widths are standard 12 feet. Where express lanes are present, tubular markers are used to separate express lane traffic and general-use traffic.

Sheridan Street – This roadway consists of six lanes (3 EB + 3 WB), with a posted speed of 40 mph and with five signalized intersections within the AOI (including I-95 ramp terminal intersections). Sheridan Street is functionally classified as an Urban Principal Arterial, and the designated context classification is C4 (Urban General).

Stirling Road - This roadway consists of six lanes (3 EB + 3 WB), with a posted speed of 45 mph and with seven signalized intersections within the AOI (including I-95 ramp terminal intersections). Stirling Road is functionally classified as an Urban Principal Arterial, and the designated context classification is C4 (Urban General) west of I-95 and C3C (Suburban Commercial) east of I-95.

Griffin Road - This roadway consists of six lanes (3 EB + 3 WB), with a posted speed of 45 mph and with four signalized intersections within the AOI (including I-95 ramp terminal intersections). Griffin Road is functionally classified as an Urban Principal Arterial, and the designated context classification is C4 (Urban General).

Table 3-1 Classification of Study Roadways

Roadway	From	To	Functional Classification	Context Class	Number of Lanes
SR 9 / I-95	Hollywood Blvd.	N of Griffin Rd.	Urban Principal Arterial (Interstate)	LA	Varies GU: 8 - 10 lanes EL: 0 - 4 lanes
SR 822/ Sheridan Street	N 29th Avenue	N 26th Ave.	Urban Principal Arterial (other)	C4	6
SR 848 / Stirling Road	Anglers Ave.	Bryan Rd.	Urban Minor Arterial	C4 (Anglers to I-95) C3C (I-95 to Bryan Rd)	6

3.3 Existing Traffic Volumes

Traffic volumes for the existing year (2021) were developed by FDOT as part of the pre-work for the PD&E Study. The traffic volumes are documented in the ***Traffic Data Collection and Traffic Projections Report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, Updated May 2024 (Appendix B)***. **Figure 3-4** and **Figure 3-5** depict the AADT and the AM/PM peak hour volumes resulting from the FDOT's prework. The traffic volumes were developed in accordance with FDOT's practice. It involved collecting various traffic data along road segments and intersections within the study area. Data collected included:

- Three-day intersection turning movement counts during AM (6:00 AM to 9:00 AM) and PM (4:00 PM to 7:00 PM) peak periods at the study intersections along Sheridan Street, Stirling Road, and Griffin Road.
- Seventy-two-hour vehicle volume counts along road segments at the study intersections on Sheridan Street, Stirling and Griffin Road.
- Seventy-two-hour vehicle classification counts at select locations on Sheridan Street, Stirling Road, and Griffin Road.
- Seventy-two-hour vehicle classification counts on I-95 ramp terminals at Sheridan Street, Stirling Road, and Griffin Road

In addition to the above, data from Florida Traffic Online (Historical AADT reports, Weekly Axle Category Factor Report, Peak Season Factor Category Report) were used in processing the traffic data for the network. The traffic volumes were smoothed and balanced resulting in the Existing Year (2021) volumes depicted in **Figure 3-4** and **Figure 3-5**.

3.4 Existing Traffic Operations

A detailed microsimulation analysis using VISSIM 2022-07 was conducted to evaluate system-wide operational performance. VISSIM models were prepared for the Existing Year 2021 AM and PM peak periods. The primary objective of the existing conditions analysis was to establish the current operational conditions along I-95 and the study interchanges and intersections.

To identify and quantify the operating conditions in terms of travel time, RITIS big data platform was used to assist in the calibration process. Several days of RITIS speed data from October and November of 2021, Tuesdays through Thursdays, were reviewed to identify typical speed conditions. Hour 2 of the simulation was the primary focus when removing outlier days. Significant daily variation in congestion exists within the project area. However, major trends were identified for each peak period.

Fifteen-minute volume profiles were developed for the analysis area and input into Vissim for the four-hour AM and PM peak periods with an additional 30-minute seed time. The volume profiles were developed from the 15-minute variation in traffic observed in the traffic counts collected for this project. The signal timing and phasing data for the AM and PM peak periods were provided by Broward County.

Ten model iterations with different seed numbers were executed for the AM and PM peak periods. The results provided in this report represent an average of the 10 simulation runs. A summary of the results of the existing VISSIM operational analysis are provided in the following sections. Additional information on the existing conditions calibration effort is provided in the Vissim Calibration Report (**Appendix C**).

3.4.1.1 Existing Speed Profiles

The speed profiles (derived from VISSIM travel time output) for the existing 2021 AM and PM peak periods can be found in **Figure 3-6** through **Figure 3-9**. These figures present the average speed output from VISSIM for each of the four hours along with the RITIS data and show that the final calibration parameters provide reasonable speed/congestion trends in both the AM and PM peak periods and captures the build-up of congestion and its dissipation.

The AM peak period experienced congestion on I-95 in the northbound direction near the Sheridan Street on-ramp reaching speeds as low as 30 mph in Hour 2. Full recovery to free-flow conditions is observed during hour 4. The southbound direction experienced near free-flow conditions for the entire project area which is between 60 and 65 mph.

The PM peak period experienced congestion in the northbound direction due to queue spillback from the I-95 northbound to I-595 westbound ramp reaching speeds as low as 30 mph in Hour 2. Full recovery to free-flow conditions is observed during hour 4. The southbound direction experienced congestion approximately between the I-595 overpass to the express lane ingress due to the I-595 major merge and high demand for the express lane facility. Hour 2 observed speeds as low as 20 mph, while Hour 4 recovered to speeds 50 mph or higher.

3.4.1.2 Existing Study Intersection Operations

The existing conditions intersection operational analysis results are shown in **Table 3.3**. The results indicate that the study intersections operate under acceptable delay time (<80 seconds/vehicle) in the existing conditions. It should be noted that the level of service (LOS) reported from the Vissim analysis are approximate values based on delays gathered from the Vissim models and using the Highway Capacity Manual (HCM) LOS thresholds. Since delays are computed differently in Vissim and HCM, the LOS estimates reported using Vissim data may differ from LOS computed using HCM procedures.

Table 3-2 2021 Existing Intersection Delay and Estimated LOS

Intersection Location	AM Peak		PM Peak	
	Delay (s/veh)	Estimated LOS	Delay (s/veh)	Estimated LOS
Sheridan Street at 29th Avenue	34.3	C	37.5	D
Sheridan Street at I-95 SB Terminal	21.6	C	23.5	C
Sheridan Street at I-95 NB Terminal	43.6	D	38.7	D
Sheridan Street at 28th Avenue*	29.0	D	18.2	C
Sheridan Street at 26th Avenue	49.9	D	38.0	D
Stirling Road at Anglers Avenue	17.1	B	17.6	B
Stirling Road at 29th Avenue	6.6	A	12.3	B
Stirling Road at I-95 SB Terminal	32.1	C	34.8	C
Stirling Road at I-95 NB Terminal	29.5	C	30.2	C
Stirling Road at Oakwood Boulevard	22.1	C	35.6	D
Stirling Road at Compass Way	10.7	B	14.8	B
Stirling Road at Bryan Road	8.8	A	11.2	B

3.5 Corridor Crash Data

Historical crash data for the project study area was gathered from Signal Four Analytics database. Crash data was collected for the roadway segments within the area of influence for the period January 1, 2018, through December 31, 2022 (most recent 5-year period available at the time of the study). The raw crash data was reviewed and refined to remove any apparent reported crashes that were miscoded or may have occurred outside the area of influence. The refined data was then summarized and tabulated to identify various crash characteristics, including crash type, severity, lighting condition, and surface conditions. The crash summary tables are presented in **Tables 3-3** through **3-6**. Notable findings from the crash data summaries are discussed below.

I-95 Segment from South of Sheridan Street to North of Hollywood Boulevard

The crash data for the I-95 segment within the area of influence is summarized in **Table 3-3**. As depicted in the table, a total of 5,716 crashes were reported along the I-95 study segment during the 5-year period – 1,219 in 2018, 1,177 in 2019, 883 in 2020, 1,126 in 2021 and 1,311 in 2022. There is a noticeable drop in the number of crashes in 2020 which is likely due to impacts from the COVID-19 Pandemic. The crashes experienced on I-95 included 17 fatal crashes and 85 serious injury crashes. The predominant crash patterns were rear-end (53.9%), sideswipes (24.0%) and fixed object (11.0%). Crashes experienced under dark conditions (34.5%) and wet conditions (20.7%) were higher than the Broward County average of 24.5% and 8.0%, respectively. These findings suggest that nighttime visibility and wet surface conditions are probable safety concerns along the I-95 Segment. The crash heat map in **Figure 3-10** indicates that there is a high concentration of crashes in the vicinity of the Stirling Road Interchange. This coincides with the location of the express lanes ingress (southbound) and egress (northbound) ramps which introduce additional conflicts on the mainline with increased crash risk. Additionally, a review of FDOT's High Crash Locations using Signal Four Analytics data indicates that multiple segments of the I-95 corridor experienced abnormally high crash rates in years 2018, 2020, 2021 and 2022. The following segments were reported on the High Crash List:

- I-95 N of Griffin Road – 2018 through 2022
- I-95 from Stirling Road to Griffin Road - 2018, 2020, 2021 and 2022
- Hollywood Boulevard to Stirling Road - 2018, 2020, 2021 and 2022

Based on the above findings it can be concluded that the I-95 study segment is a high crash corridor. These findings support the need for safety improvements along the I-95 segment, which is a prime objective for the PD&E Study. Furthermore, the high number of fatal crashes (17) and serious injury crashes (85) crashes indicate that the I-95 corridor is a prime candidate for FDOT's Target Zero initiative which aims to eliminate fatal and serious injury crashes.

I-95 at Sheridan Street Ramp Terminal Intersections

The crash data for the I-95/Sheridan Street Ramp Terminals Intersection is summarized in **Table 3-4**. As depicted in the table, a total of 374 crashes were reported at the intersection during the 5-year period – 94 in 2018, 90 in 2019, 50 in 2020, 91 in 2021 and 49 in 2022. The crashes at the intersection included zero (0) fatal crashes and 1 serious injury crash. The predominant crash patterns were rear-end (40.9%), sideswipes (18.4%) and crashes classified as others (18.4%). Crashes experienced under dark conditions (32.4%) and wet conditions (12.8%) were higher than the Broward County average of 24.5% and 8.0%, respectively. These findings suggest that nighttime visibility and wet surface conditions are probable safety concerns at the intersection. A review of FDOT's High Crash Locations using Signal Four Analytics data indicates that this intersection did not experience abnormally high crash rates in any year during the 5-year study period. It can therefore be concluded that the I-95/Sheridan Street Ramp Terminals Intersection is not a high crash location. The low number of fatal crashes (0) and serious injury crashes (1) indicate conditions at the intersection are favorable for reducing crash severity.

I-95 at Stirling Road Ramp Terminal Intersections

The crash data for the I-95/Stirling Road Ramp Terminals Intersection is summarized in **Table 3-5**. As depicted in the table, a total of 242 crashes were reported at the intersection during the 5-year period – 65 in 2018, 43 in 2019, 46 in 2020, 58 in 2021 and 30 in 2022. The crashes at the intersection included zero (0) fatal crashes and 1 serious injury crash. The predominant crash patterns were rear-end (53.79%), sideswipes (16.1%) and crashes classified as others (8.3%). Crashes experienced under dark conditions (31.8%) and wet conditions (14.9%) were higher than the Broward County average of 24.5% and 8.0%, respectively. These findings suggest that nighttime visibility and wet surface conditions are probable safety concerns at the intersection. A review of FDOT's High Crash Locations using Signal Four Analytics data indicates that this intersection did not experience an abnormally high crash rate in any year during the 5-year study period. It can therefore be concluded that the I-95/Stirling Road Ramp Terminals Intersection is not a high crash location. The low number of fatal crashes (0) and serious injury crashes (1) indicate conditions at the intersection are favorable for reducing crash severity.

I-95 at Griffin Road Ramp Terminal Intersections

The crash data for the I-95/Griffin Road Ramp Terminals Intersection is summarized in **Table 3-6**. As depicted in the table, a total of 187 crashes were reported at the intersection during the 5-year period – 46 in 2018, 47 in 2019, 28 in 2020, 36 in 2021 and 30 in 2022. The crashes at the intersection included 2 fatal crashes and 5 serious injury crashes. The predominant crash patterns were rear-end (47.1), sideswipes (18.2%) and crashes classified as others (9.6%) and non-collisions (9.6%). Crashes experienced under dark conditions (28.3%) and wet conditions (16.0%) were higher than the Broward County average of 24.5% and 8.0%, respectively. These findings suggest that nighttime visibility and wet surface conditions are probable safety concerns at the intersection. A review of FDOT's High Crash Locations using Signal Four Analytics data indicates that this intersection did not experience abnormally high crash rates in any year during the 5-year study period. It can therefore be concluded that the I-95/Stirling Road Ramp Terminals Intersection is not a high crash location. However, the high number of fatal crashes (2) and serious injury crashes (5) indicate that conditions at the intersection may not be favorable for reducing crash severity.

FDOT	**SR 9/I-95 from Miami-Dade/Broward County Line to North of Griffin Road** Project Development and Environment Study FPID: 430170-1-22-02	**Title:** **I-95 Corridor Crash Heat Map**
		Figure No.: 3-10 Sheet 1 of 1

3.6 Existing Transit Operations

Figures 3-11, 3-12 and 3-13 depict the existing transit services operating within the project vicinity. The existing transit services include the following:

- **Local Bus Services**: Local bus transit services are provided by Broward County Transit, and the City of Dania Beach operates a local community shuttle service. The local bus services include multiple routes that traverse along Sheridan Street, Stirling Road, Griffin Road, and various north/south connecting arterials.

- **Express Bus Services**: Express bus services (595 Express) operate along I-95 within the study corridor with a designated stop at the Sheridan Street Tri-Rail Station. The 595 Express provides express bus services between the Amerant Bank Arena Park and Ride located in the City of Sunrise and Downtown Miami in Miami-Dade County. The 595 Express operates with a schedule of approximately ½ hour between express buses during AM and PM peak periods on typical weekdays.

- **Commuter Rail Services**: The Tri-rial railroad runs parallel and immediately west of I-95 within the study area. Tri-rail provides commuter rail service within the tri-county region (Miami-Dade, Broward, and Palm Beach Counties) with limited stops at designated rail station. Within the SIMR study limits, Tri-rail stations are located at I-95/Griffin Road Interchange (Fort Lauderdale/Hollywood International Airport Station) and at I-95/Sheridan Street Interchange (Sheridan Street Station). Tri-rail operates with a schedule of approximately ½ hour between trains during AM and PM peak periods on typical weekdays. The Tri-rail stations facilitate transfers between the rail service and various bus services as depicted **in Figure 3-11**. The railroad operations impact roadway traffic operations particularly at I-95/Griffin Road Interchange due to its proximity (approximately 300 feet) to the existing at-grade railroad crossing. Railroad operations are less impactful along Stirling Road which has greater separation (approximately 1500 feet) to the I-95 interchange and Sheridan Street which has a grade separated railroad crossing.

Figure 3-11 Broward County Transit Services

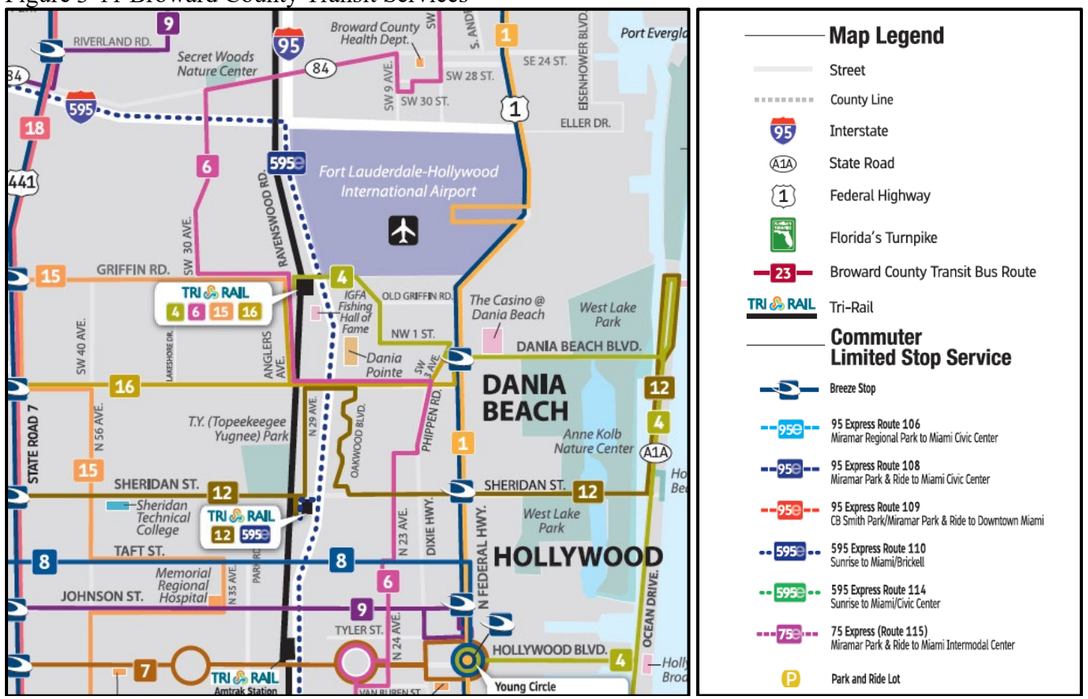

Figure 3-12 Dania Beach Community Shuttle Service

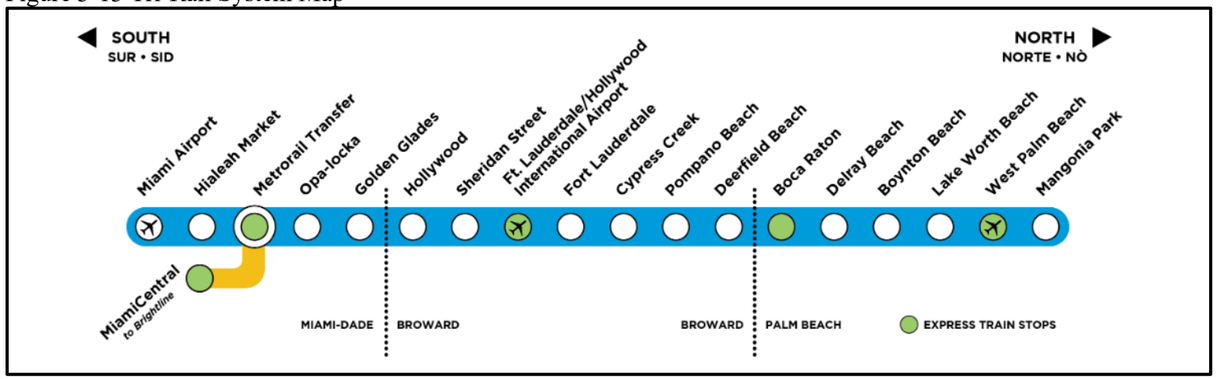
Figure 3-13 Tri-Rail System Map



4.0 NEED

This section describes the need for roadway infrastructure improvements within the study corridor. The need is consistent with the need statement documented in the Efficient Transportation Decision Making (ETDM) Preliminary Programming Screen Summary Report, November 2022 (ETDM No.: 14500). Project specific data (historical crashes and traffic data) have been updated to reflect updated information documented in this SIMR.

Traffic Demand (primary)
The year 2021 Annual Average Daily Traffic (AADT) along the SR-9/I-95 project limits ranged between 265,500 vehicles and 286,000 vehicles. Based on the traffic projections prepared for the project, the traffic demand is projected to continue increasing at a rate of 0.5% per year. The projected 2050 AADT was estimated to be between 303,000 vehicles and 333,000 vehicles. The proposed improvements include addressing existing and future traffic demand.

Operational Deficiencies (primary)
The SR 9/I-95 project interchanges, ramp terminals, and cross streets within the project limits are over-saturated. Traffic analysis was conducted for each interchange as part of the FDOT District 4 Interchange Concept Development Report from 2016. According to the study, the following locations are operating at Level of Service (LOS) E or worse during existing conditions (year 2012/2013):

- SR 848/Stirling Road: I-95 northbound ramp terminal intersection
- SR 822/Sheridan Street: I-95 Northbound ramp terminal intersection

The future analysis, which projected traffic demand to the year 2040, describes the following locations that are expected to operate at LOS E or worse:

- SR 818/Griffin Road: All I-95 ramp terminal intersections
- SR 848/Stirling Road: I-95 Northbound ramp terminal intersection
- SR 822/Sheridan Street: All I-95 ramp terminal intersections
- I-95 southbound freeway segments within the project limits: Eight segments
- I-95 northbound freeway segments within the project limits: Four segments

Safety (primary)
A historical crash evaluation of the SR 9/I-95 project limits revealed a total of 5,716 crashes observed over a five-year period between 2018 and 2022. Seventeen (0.3%) of these crashes were fatal, 85 (1.5%) involved serious injuries and 1045 (18.3%) were coded as injury crashes. The Broward Countywide crash statistics indicate that fatal crashes experienced on the I-95 corridor approximately match the County average of 0.34% whereas serious injury and injury crashes experienced on I-95 exceed the County average of 1.22% and 6.36%, respectively. The predominant crash types along the project corridor consisted of rear end at 53.9%, followed by sideswipes at 24.0% and fixed object crashes at 11.0%. Almost all the fixed object crashes were indicative of a lane departure event such as hitting barrier. The rear end crash types are higher than the Broward County statistic of 32.14%. Higher rear end crash types may be correlated to congestion. A review of FDOT's High Crash Locations indicates that multiple segments of the I-95 corridor experienced abnormally high crash rates in 2018, 2020, 2021 and 2022.

The Broward MPOs 2045 LRTP depicts the SR 9/I-95 project limits as a top corridor for future safety studies due to its high severity index per mile of over 200. The results are similar for the interchange cross streets at SR 822/Sheridan Street, SR 848/Stirling Road, and SR 818/Griffin Road. The severity index is a measure that looks at total crashes and crash severity and uses a weighted average (higher score for incapacitating and fatal crashes) to develop an index that ranks locations in terms of their importance for future safety analysis and improvements. The 2021 Florida Strategic Highway Safety Plan (FSHSP) has identified lane departure crashes as an emphasis area which is a high crash type along the project corridor. Pedestrians, bicyclists, and intersections are another emphasis area which applies to the interchange areas. The proposed improvements include operational improvements at the interchanges which are expected to alleviate crash patterns that are correlated to congestion. Improvements at the cross streets are anticipated to enhance bicycle and pedestrian accommodations which may also alleviate crash patterns related to those modes.

SR 9/I-95 and the project interchanges are designated evacuation routes according to the Florida Division of Emergency Management and Broward County. The proposed project improvements will address operational deficiencies which will help to improve travel time during evacuation events and emergency situations.

Social Demands and Economic Development (secondary)
SR 9/I-95, which is part of the Florida Strategic Intermodal System (SIS), supports the regional social and economic development activity in South Florida. The facility connects the major employment and population centers in Broward County, Miami-Dade County, and Palm Beach County. According to the Broward MPO 2045 LRTP, the County's population is projected to grow 27% between the years 2015 and 2045. Similarly, employment is projected to increase 25% in that same time period. Urban infill and redevelopment are common in the region and in the vicinity of the project limits. The proposed improvements will enhance connectivity to nearby employment areas, schools, and recreational facilities.

Modal Interrelationships (secondary)
SR 9/I-95 is part of the SIS which is a high priority network of transportation facilities important to the state's economy and mobility. The corridor is a primary highway in the National Highway Freight Network. The truck factor varies but is approximately 5% within the SR-9/I-95 project limits. The limited access corridor also services several premium express transit routes for Broward County Transit and Miami-Dade County Department of Transportation and Public Works Metrobus system. All of the project interchange areas include sidewalks on both sides of the arterials passing underneath the SR 9/I- 95 bridges. Generally, there is a lack of dedicated bicycle facilities. The Broward MPO Complete Streets Master Plan (dated 2019) confirms the gaps in the existing bicycle network along the project interchange cross streets. This master plan proposes a bicycle facility project along SR 818/Griffin Road and complete streets projects along SR 848/Stirling Road and SR 822/Sheridan Street.

The proposed improvements will address operational deficiencies at the interchanges and improve access to the managed lanes system which is expected to improve traffic flow along the SR 9/I-95 corridor benefiting all users including freight and premium express bus transit. Improvements at the interchange ramp terminals and arterial cross streets are expected to benefit multiple modes such as vehicles, freight, transit, bicyclists, and pedestrians.

5.0 FUTURE NO BUILD CONDITIONS

This section documents the future conditions within the study area of influence for the Opening Year 2030 and Design Year 2050. This discussion includes future land use information and future No Build conditions including, 2030/2050 road network data, 2030/2050 traffic forecast and 2030/2050 traffic operations.

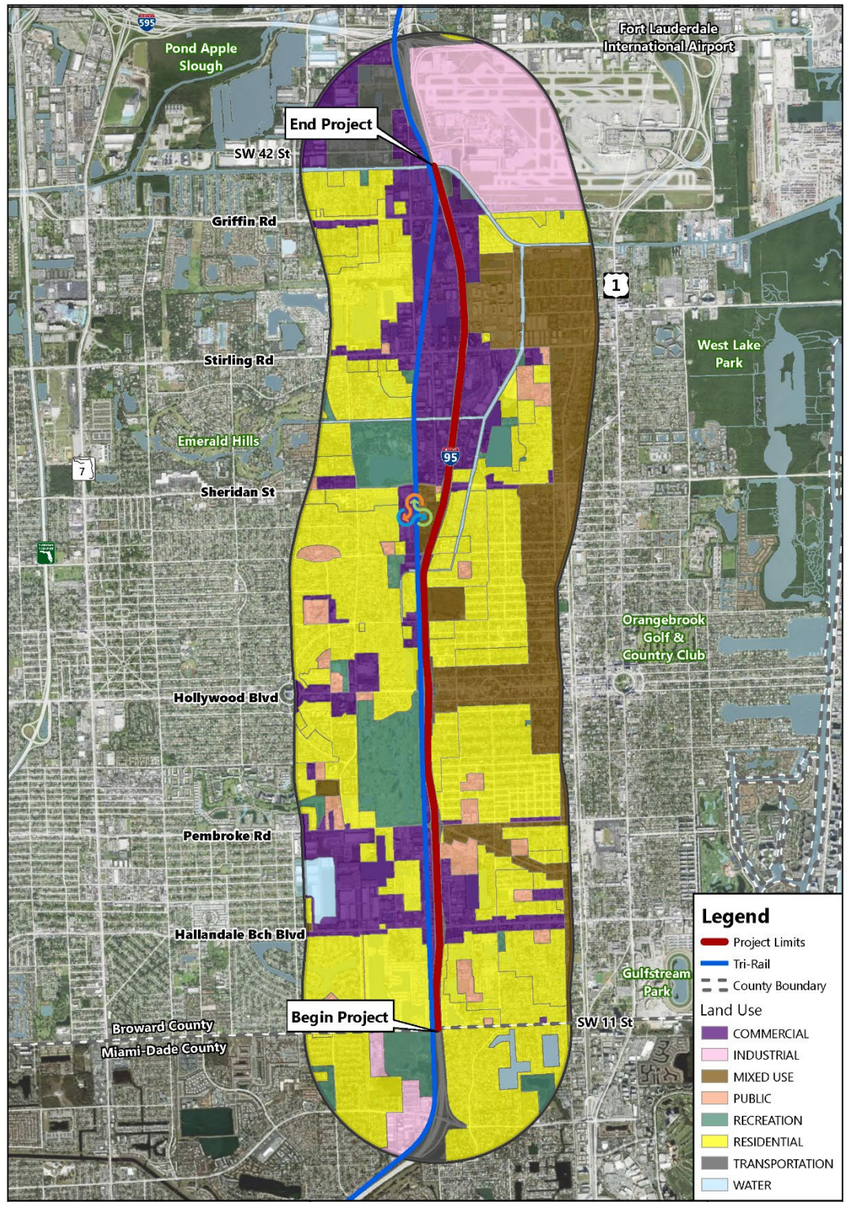
5.1 Future Land Use

The future land use adjacent to the project corridor was mapped using SFWMD land use and cover nomenclature, which are illustrated in **Figure 5-1.** The future land use map reflects the planned 2040 conditions (most recent available at time if writing). The primary land use adjacent to the project corridor is commercial. The project study area also encompasses the following land uses:

- Commercial
- Industrial
- Mixed Use
- Public
- Recreation
- Residential
- Transportation
- Water

As the existing corridor is developed, its future land use is anticipated to be very similar to the existing land use. The proposed improvements may result in redevelopment within the proposed study area, but this redevelopment will occur on land previously developed.

Figure 5-1 Future Land Use



5.2 No Build Alternative – Road Network

The No-Build Alternative includes the existing transportation network, and any funded, planned, or programmed improvements that are expected to be open to traffic by the design year 2050. This includes improvements that are incorporated in the Broward County Metropolitan Planning Organization (MPO) Transportation Improvement Program, the 2045 Cost Feasible Metropolitan Transportation Plan (MTP), the FDOT Adopted Five Year Work Program, any local government comprehensive plans and any development mitigation improvement projects that are elements of approved development orders. The No Build Road Network includes the following notable road improvement projects:

- I-95 FDOT District Four 95 Express Phase 3C Construction Project (FPID# 409354-2). This on-going construction project will add additional express lanes and associated ingress and egress points along the segment of I-95 between south of Hollywood Boulevard and north of I-595. Following implementation of this project I-95 mainline will be modified to include 4 express lanes (2 NB + 2 SB), new direct connect ramps between the I-95 express lanes and I-595 (west of I-95), a northbound express lanes egress at Hollowood Boulevard and a southbound express lanes ingress at Hollywood Boulevard.

- I-95 PD&E Study from Hallandale Beach Boulevard to Hollywood Boulevard (FPID #436903-1). The project will modify the existing I-95 interchanges at Hallandale Beach Boulevard, Pembroke Road, and Hollywood Boulevard. Along with the interchange modifications, new collector-distributor systems and modified ramp connections to I-95 mainline are proposed. LDCA was granted for the PD&E Study in October 2026.

Figure 5-2 depicts the typical section along I-95 under the No Build conditions and the line diagram in Figure 5-3 depicts the lane configuration for the No Build Road Network.

The No Build Alternative serves as the baseline condition for comparison with the Preferred Alternative resulting from the PD&E Study. Advantages of the No Build Alterative include no impact on the social, cultural, physical, or natural environment and no additional right of way or construction cost. However, the No Build Alternative will not address the need (future traffic demand, operational deficiencies, safety concerns, social demands, economic development, and modal interrelationships) for the project.

5.3 No Build Alternative Future Traffic Forecast (2030 & 2050)

Traffic forecast for the No Build Opening Year (2030) and Design Year (2050) were developed in accordance with the methodology discussed under Section 2.5 of the SIMR. Development of the travel demand forecast is detailed in the attached **Project Traffic Forecasting Memorandum (Appendix B**). The resulting travel demand forecast for No Build Opening Year (2030) is summarized in **Figure 5-4** and **Figure 5-5**. The Design Year (2050) forecast is summarized in **Figure 5-6** and **Figure 5-7.**

Traffic forecasts for future build conditions utilized the No Build traffic forecasts presented here-in with volumes reassigned as needed to match proposed design modifications in the Build Alternatives – discussed in subsequent sections of the SIMR.

6.0 ALTERNATIVES

This section offers a discussion on the alternatives considered for this SIMR. This includes considerations for I-95 mainline alternatives, interchanges (Sheridan Street, Stirling Road, and Griffin Road) and the intersection of Griffin Road and Old Griffin Road. The alternatives were analyzed to assess their effectiveness in meeting the future travel demand, safety, right-of-way, and business impacts, constructability, and input from local stakeholders.

6.1 I-95 Mainline Alternatives

Multiple mainline alternatives were examined for enhancing traffic operations along northbound and southbound I-95 through to Design Year (2050). Alternative design concepts considered for the mainline included the following:

- Adding auxiliary lanes along I-95 mainline from north of Hollywood Boulevard to north of Griffin Road. Addition of auxiliary lanes will accommodate future travel demand, enhance traffic operations, and reduce risk of congestion-related crashes.
- Widening the existing on-ramps and/or off-ramps from one to two lanes (Sheridan Street, Stirling Road and Griffin Road). Widening the ramps will facilitate future travel demand while complementing the implementation of auxiliary lanes along the mainline.
- Replacing the existing slip ramp access for the express lanes' ingress and egress points with new elevated braded ramps. This improvement would enhance operations and reduce conflicts involving vehicles weaving between the GU lanes on-ramps/off-ramps and the express lanes ingress/egress points. Considerations for the replacement of the slip ramps was a commitment agreed with the FHWA upon approval of the PD&E Studies leading to implementation of the I-95 express lanes.

Various combinations of the above improvements were considered for northbound and southbound I-95. Alternatives that were considered to be most viable are discussed in the following sections along with the No Build.

6.1.1 Northbound I-95 Mainline Alternatives

The lane schematics in **Figure 6-1** illustrate the lane configuration along NB I-95 for the No Build condition and three alternative Build configurations described below:

- **Alternative 1** adds one auxiliary lane along NB I-95 beginning at the Hollywood Boulevard On-Ramp and terminating as a drop lane at the at I-595 Off-Ramp. In addition, the Sheridan Street Off-Ramp is widened from 1 to 2 lanes. This alternative proposes no modifications to the express lanes ingress and egress points which would remain as slip ramp configurations.
- **Alternative 2** introduces an elevated braided ramp for the NB express lanes egress serving Sheridan Street and locations north of Sheridan Street. This braided ramp merges with the general use (GU) lanes north of Sheridan Street Off-Ramp where it adds an auxiliary lane to the mainline which continues north and terminates north of the I-595 Off-Ramp. In addition, an auxiliary lane is introduced between Hollywood Boulevard and Sheridan Street. The Off-Ramps at Sheridan Street, Stirling Road and Griffin Road are also widened to two lanes. This alternative proposes no modifications to the express lane ingress serving Sheridan Street which would remain as slip ramp configuration.
- **Alternative 3** introduces an elevated braided ramp for the NB express lanes egress serving Sheridan Street and locations north of Sheridan Street. This braided ramp merges with the general use (GU) lanes north of Sheridan Street Off-Ramp where it adds an auxiliary lane to the mainline which continues north and terminates as a drop lane at the I-595 Off-Ramp. In addition, an auxiliary lane is introduced between Hollywood Boulevard and Sheridan Street. The Off-Ramps at Sheridan Street, Stirling Road and Griffin Road are also widened to two lanes. This alternative also introduces an elevated braded ramp for the express lane ingress serving Sheridan Street.

A Vissim microsimulation analysis was performed to compare relative operating conditions of the three northbound mainline alternatives and the No Build alterative under 2050 traffic conditions. This Vissim analysis served only as a screening tool for the mainline alternatives. The analysis was performed using simplified Vissim models which excluded the crossing arterials (Sheridan Street, Stirling Road, Griffin Road) and ramp terminal intersections. It is understood that while the results from these simplified Vissim models provide a reasonable screening tool for comparing alternatives, the results do not reflect the anticipated operating conditions for models where the full network (mainline and arterials) is simulated. Results from the mainline microsimulation screening analysis are depicted in **Figure 6-2**.

As depicted in **Figure 6-2** the No Build Alternative experiences considerable congestion along NB I-95 mainline in both the AM and PM peak periods with operating speeds dropping below 30 mph for large segments of the corridor. All the Build alternatives generate substantially better traffic operations when compared to No Build with operating speeds above 45 mph throughout the study segment. Based om the microsimulation results, all three Build alternatives would generate similar operating speeds along I-95 mainline. From a safety perspective, Alternative 2 and Alternative 3 were preferred over Alternative 1 due to the introduction of the elevated braided ramps for the express lanes ingress/egress points. The braided ramps eliminate the weave to/from the express lanes and the adjacent on-ramps and off-ramps. This reduces conflicts and improves safety. However, based on preliminary concept plans for the alternatives, it was determined that implementation of the braided ramp for the NB ingress (per Alternative 3) would have substantial right-of-way impacts over and above what the project could support. Hence, Alternative 3, was discarded in favor of Alternative 2. Based on the above considerations, Alternative 2 was selected as the preferred design concept for NB I-95 mainline.

6.1.2 Southbound I-95 Mainline Alternatives

The lane schematics in **Figure 6-3** illustrate the lane configuration along SB I-95 for the No Build condition and two alternative Build configurations described below:

- **Alternative 1** adds one auxiliary lane along SB I-95 beginning at the Griffin Road Off-Ramp and terminating as a drop lane at the at Hollywood Boulevard Off-Ramp. In addition, the Sheridan Street Off-Ramp is widened from 1 to 2 lanes. This alternative proposes no modifications to the express lanes ingress and egress points which would remain as slip ramp configurations.
- **Alternative 2** introduces an elevated braided ramp for the SB express lanes egress serving Sheridan Street and locations south of Sheridan Street. This braided ramp merges with the general use (GU) lanes south of Sheridan Street Off-Ramp. Unlike the NB elevated braided ramp it was determined that it was not feasible to merge the SB braided ramp and continue it as an auxiliary lane due to extensive right-of-way impacts. This alternative also widens the Sheridan Street Off-Ramp to two lanes.

Similar to the NB I-95, a Vissim microsimulation analysis was performed to compare relative operating conditions of the two southbound mainline alternatives and the No Build alterative under 2050 traffic conditions. This Vissim analysis served as a screening tool for the mainline alternatives utilizing simplified Vissim models which excluded the crossing arterials (Sheridan Street, Stirling Road, Griffin Road) and ramp terminal intersections. The results from these simplified Vissim models provide a reasonable screening tool for comparing alternatives, but do not reflect the anticipated operating conditions for models where the full network (mainline and arterials) is simulated. Results from the mainline microsimulation screening analysis for SB I-95 Alternatives are depicted in **Figure 6-4**.

As depicted in **Figure 6-4** the No Build Alternative experiences considerable congestion along SB I-95 mainline in both the AM and PM peak periods with operating speeds dropping below 30 mph for large segments of the corridor. The two Build alternatives generate better traffic operations when compared to the No Build Condition. However, in Alternative 2, mainline speeds drop below 40 mph in the vicinity of Sheridan Street where the elevated braided ramp merges onto the mainline. Due to this significant drop in operating speeds, Alternative 2 was discarded in favor of Alternative 1 which exhibited high operating speeds above 50 mph throughout the study segment. Based on the above considerations, Alternative 1 was selected as the preferred design concept for SB I-95 mainline.

6.2 Interchange Alternatives

The screening of interchange alternatives began with a global assessment of multiple alternative interchange configurations. The global assessment considered issues such as right-of-way restrictions given the urban setting of the corridor; constructability issues avoiding alternatives that may require closing segments of I-95 for extending periods; and implementation cost avoiding alternatives that would be extremely costly to implement. Based on these global assessments the following interchange design concepts were discarded in favor of more viable alternatives that could meet the project needs:

- Single Point Diamond (SPUI) configuration was discarded at all locations due to constructability issues. It was determined that the bridges on the cross streets all have a center pier. Implementation of a SPUI would therefore involve one of two options, none of which were considered viable.
    - Replace the bridge and reconstruct approximately ½ mile of I-95 to meet the required vertical clearance. This option was considered not viable due to the excessive cost.
    - Replace the bridge substructure and lower the cross street vertical profile to meet required vertical clearance. This option was considered not viable due to the height of the existing water table which restricts lowering the profile of the cross streets.

- Cloverleaf interchange configurations and the various combinations thereof (Full, Partial, Type A, Type B) were discarded at all locations due to the expansive right-of-way needed to implement such design configurations

Following the global screening of the interchange design concepts, a more detailed evaluation was performed for a short list of viable interchange concepts that could potentially meet the needs of the project. Synchro models based on 2050 traffic conditions were developed to aid in the assessment and screening of the viable alternatives. A discussion on the viable alternatives at each interchange follows.

6.2.1 I-95 at Sheridan Street Alternatives

Figures 6-5 through **6-7** illustrate the alternative design concepts for the I-95/Sheridan Street Interchange.

- **Alternative 1 - Modified Diamond Interchange (Figure 6-5)**. This alternative modifies the existing diamond interchange. The northbound off-ramp is widened to accommodate 3 left turn lanes and 3 right turn lanes. The southbound off-ramp is widened similarly to accommodate 3 left turn lanes and 3 right turn lanes. Operations analyses preformed using Synchro models indicate that this interchange configuration will operate at LOS E/E in the AM/PM peak periods in the Design Year (2050) traffic conditions.
- **Alternative 2 – NB to WB Flyover (Median Interchange, Figure 6-6)**. This alternative will introduce a new flyover to accommodate movements from NB I-95 to WB Sheridan Street. This proposed new flyover would be elevated at 3rd level above I-95 and follow an alignment along I-95 median before turning west to connect to WB Sheridan Street. Operations analysis performed using Synchro models indicate that this interchange configuration will operate at LOS C/D in the AM/PM peak periods in the Design Year (2050) traffic conditions.
- **Alternative 3 – NB to WB Flyover (East Interchange, Figure 6-7)**. This alternative will introduce a new flyover to accommodate movements from NB I-95 to WB Sheridan Street. This proposed new flyover would be elevated at 3rd level above I-95 and follow an alignment to the east of I-95 before turning west to connect to WB Sheridan Street. Operations analysis performed using Synchro models indicate that this interchange configuration will operate at LOS C/D in the AM/PM peak periods in the Design Year (2050) traffic conditions.

Preliminary concept plans were developed for the above three alternative design concepts. Based on the preliminary concept plans it was determined that implementation of Alternative 3 would involve considerable right-of-way impacts over and above what the project could reasonably support. Hence, Alternative 3 was discarded due to excessive right-of-way impacts. It was also assessed that implementation of Alternative 2 would present significant constructability issues with extensive impacts to I-95 operations. Alternative 2 would also have considerable right-of-way impacts over and above the requirements for implementing Alternative 1. Hence, Alternative 2 was discarded from consideration. Based on the above considerations, Alternative 1 was selected as the preferred design concept for I-95 at /Sheridan Street interchange configuration.

6.2.2 I-95 at Stirling Road Alternatives

Figures 6-8 and **Figure 6-9** illustrate the alternative design concepts for the I-95/Stirling Road Interchange.

- **Alternative 1 - Modified Diamond Interchange (Figure 6-8)**. This alternative modifies the existing diamond interchange. The northbound off-ramp is widened to accommodate 3 left turn lanes and 2 right turn lanes. The southbound off-ramp is widened to accommodate 3 left turn lanes and 2 right turn lanes. In addition, the eastbound and westbound approaches are widened to accommodate two right turn lanes. Operations analyses preformed using Synchro models indicate that this interchange configuration will operate at LOS D/D in the AM/PM peak periods in the Design Year (2050) traffic conditions.
- **Alternative 2 – Diverging Diamond Interchange (DDI, Figure 6-9)**. This alternative introduces a new Diverging Diamond Interchange (DDI) at I-95 and Stirling Road. The proposed DDI accommodates 4 eastbound lanes and 4 westbound lanes within the crossover segments of the interchange. The northbound and southbound ramp terminals each accommodate two right turn lanes and two left turn lanes. One free flowing right turn lane is provided for the eastbound and westbound right turns (on-demand pedestrian signals available to facilitate occasional pedestrian movements). Operations analysis performed using Synchro models indicate that interchange configuration will operate at LOS D/D in the AM/PM peak periods in the Design Year (2050) traffic conditions.

A review of the preliminary concept plans that were developed for the above two alternative design concepts indicate that both the DDI and Modified Diamond Interchange are expected to have similar modest right-of-way impacts. Both alternatives also have similar traffic operations in Design year (2050), meeting Target LOS D. However, the 2-phase operation of the DDI allows it to have more substantial reserve capacity when compared with the 4-phase operation of the Modified Diamond Interchange. Hence, based on this assessment. Alternative 2 (DDI) was selected as the preferred design concept for I-95 at /Stirling Road interchange configuration.

6.2.3 I-95 at Griffin Road Alternatives

Figures 6-10 and **Figure 6-11** illustrate the alternative design concepts for the I-95/Griffin Road Interchange.

- **Alternative 1 - Modified Diamond Interchange (Figure 6-10)**. This alternative modifies the existing diamond interchange. The northbound off-ramp is widened to accommodate 3 left turn lanes

and 2 right turn lanes. The southbound off-ramp is similarly widened to accommodate 3 left turn lanes and 3 right turn lanes. In addition, the eastbound and westbound approaches are widened to accommodate two right turn lanes. Operations analyses preformed using Synchro models indicate that this interchange configuration will operate at LOS D/D in the AM/PM peak periods in the Design Year (2050) traffic conditions.

- **Alternative 2 – Diverging Diamond (DDI, Figure 6-11)**. This alternative introduces a new Diverging Diamond Interchange (DDI) at I-95 and Griffin Road. The proposed DDI accommodates 4 eastbound lanes and 4 westbound lanes within the crossover segments of the interchange. The northbound and southbound ramp terminals each accommodate two right turn lanes and two left turn lanes. One free flowing right turn lane is provided for the eastbound and westbound right turns (on-demand pedestrian signals available to facilitate occasional pedestrian movements). Operations analysis performed using Synchro models indicate that interchange configuration will operate at LOS D/D in the AM/PM peak periods in the Design Year (2050) traffic conditions.

In reviewing traffic operations for Alternative 2 (DDI) it was noted that the SB ramp terminal intersection is located in close proximity (approximately 200 feet west) to the adjacent Tri-Rail railroad crossing. Based on District 4's recent experience at similar location (I-95 at Linton Boulevard) a Vissim microsimulation analysis was conducted to investigate possible safety concerns that may arise due to the proximity of the railroad crossing. Based on the microsimulation analysis, it was determined that there was a potential safety concern with the proposed DDI. The screen-capture clip in **Figure 6-11** from the Vissim analysis illustrates the safety concern. During peak periods, WB queues from Anglers Avenue may spillback across the railroad tracks and into the DDI interchange. If a train crossing event occurs under this condition, the signal sequence would be preempted to allow EB traffic on Griffin Road to clear the tracks. However, the EB queues may not be able to clear the tracks in a timely manner if the WB queues are blocking traffic flow at the DDI crossover point. This could present a serious safety risk with the DDI. This risk is mitigated in the Diamond Interchange Concept which facilitates EB and WB movements to flow concurrently without conflicts. Based on these findings, Alternative 2 (DDI) was discarded and Alternative 1 (Modified Diamond Interchange) was selected as the preferred design concept for I-95 at Griffin Road Interchange.

6.3 Griffin Road at Old Griffin Road Alternatives

Figure 6-12 and **Figure 6-13** illustrate the alternative design concepts for the intersection of Griffin Road and Old Griffin Road.

- **Alternative 1 – EB Free Flow (Figure 6-12)**. This alternative modifies the intersection configuration to provide free flow conditions for eastbound traffic on Griffin Road. The design modifications include the following:
  - The north leg of the intersection is modified to remove connections to the service road west of Old Griffin Road. This modification reduces the number of connections at the intersection from five (existing) to four (proposed). Removal of connections to the existing service road was coordinated with the Fort Lauderdale/Hollywood International Airport.
  - Restrict access on the northbound approach to right turn only. Existing northbound left turn movements are rerouted east along Old Griffin Road and utilize a proposed new U-turn facility to access westbound Griffin Road.
  - A new roadway is proposed on the north side of the intersection that will provide direct connection from WB Old Griffin Road to NB I-95.
  - Access from WB Old Griffin Road to WB I-95 is signalized. This will allow safe and efficient access for movements from WB Old Griffin Road to SB I-95 ramps as well as traffic continuing west on Griffin Road.
  - Eastbound movements on Griffin Road operate under free flow conditions. The free flow condition will optimize traffic operations along EB Griffin Road.
  - Westbound left turns from Griffin Road are modified to operate under yield control.

  Traffic operations for the proposed modified intersection were evaluated using Synchro models. The analysis indicates that the signalized movements (WB Griffin Road and WB Old Griffin Road) will operate at LOS D in the AM and PM peak periods.

- **Alternative 2 – Modified Signal Control (Figure 6-13)**. This alternative modifies the intersection configuration and maintains signal control for all movements. The design modifications include the following:
  - The north leg of the intersection is modified to remove connections to the service road west of Old Griffin Road. This modification reduces the number of connections at the intersection from five (existing) to four (proposed). Removal of connections to the existing service road was coordinated with the Fort Lauderdale/Hollywood International Airport.
  - Restrict access on the northbound approach to right turns only. Existing northbound left turn movements are rerouted east along Old Griffin Road and utilize a proposed new U-turn facility to access westbound Griffin Road.
  - A new roadway is proposed on the north side of the intersection that will provide direct connection from WB Old Griffin Road to NB I-95.
  - Access from WB Old Griffin Road to WB Griffin Road is signalized. This will allow safe and efficient access for movements from WB Old Griffin Road to SB I-95 ramps as well as traffic continuing west on Griffin Road.
  - Signal control is maintained for Griffin Road eastbound through movement, westbound left turns and right turn movements exiting the properties on the south side on the intersection.

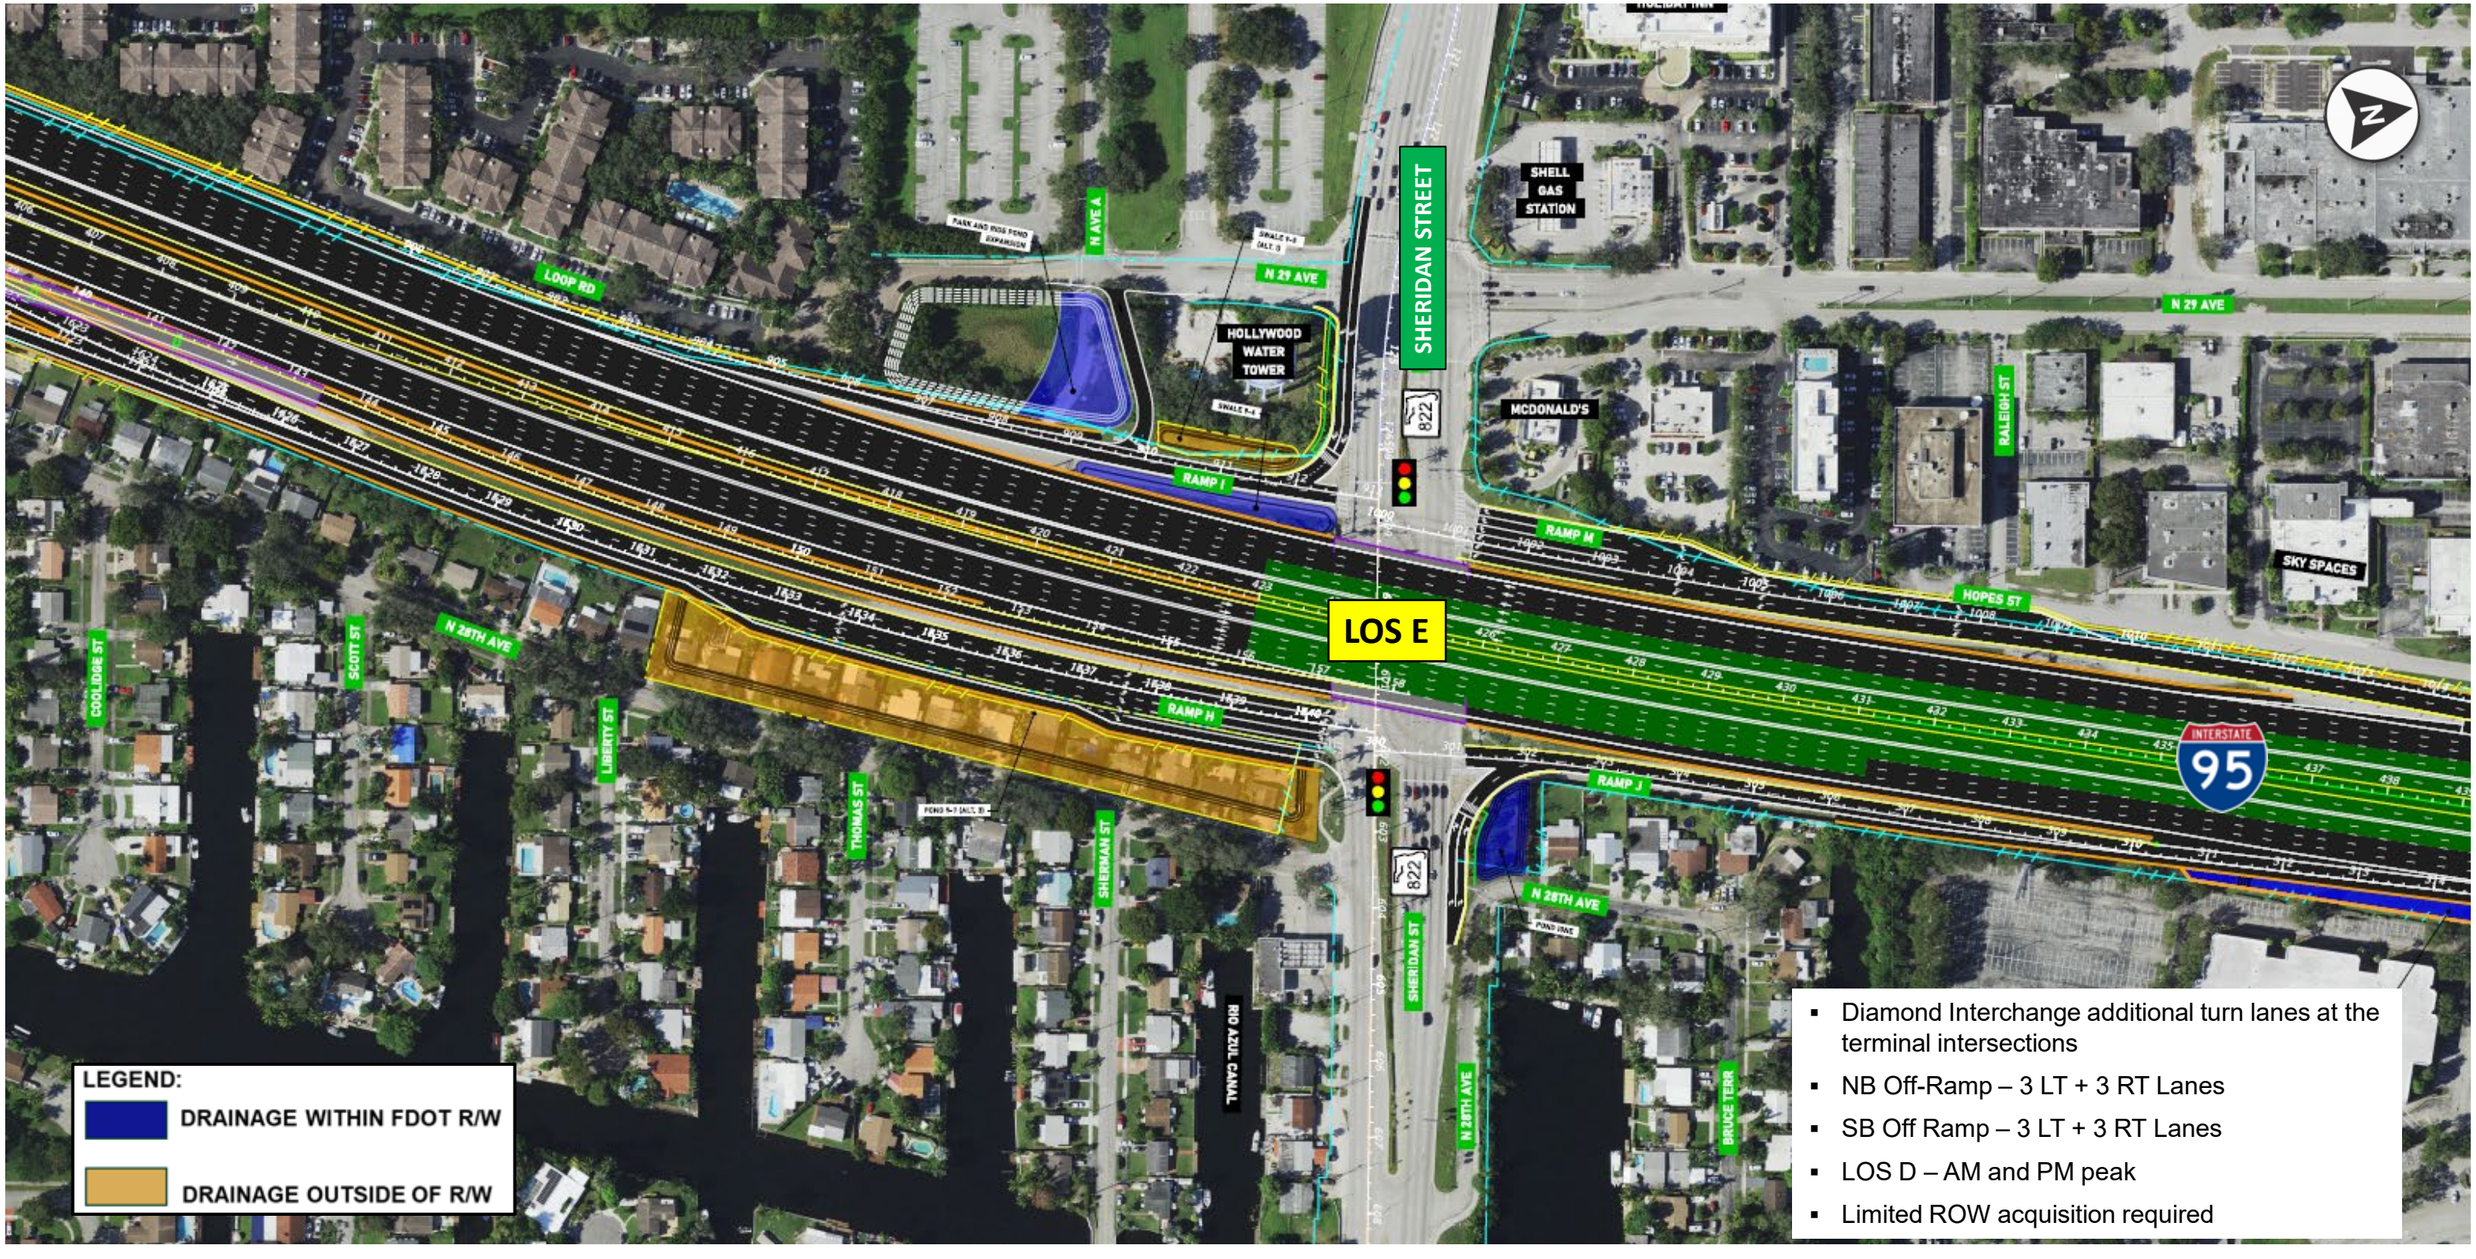
  Traffic operations for the proposed modified intersection were evaluated using Synchro models. The analysis indicates that the signalized intersections will operate at LOS D/D in the AM and PM peak periods.

The above two design alternatives were presented to various stakeholders including Broward County, Fort Lauderdale/Hollywood International Airport, City of Dania Beach, Design Center of America (DCOTA), and other property owners connecting to the south of the intersection. Based on the feedback received, and FDOT's assessment of safety and anticipated operating conditions, Alternative 2 (Modified Signal Control) was initially selected as the preferred design concept for the intersection of Old Griffin Road and Griffin Road. Through further consultation with the stakeholders and recommendations resulting from FDOT's Value Engineering review of the project, Alternative 2 was further refined to create a new Alternative 3, described below.

- **Alternative 3 – Modify Signal and Remove WBR (Figure 6-14)**. This alternative modifies the intersection configuration, modifies traffic flows and maintains signal control for all movements. The design modifications include the following:

- The north leg of the intersection is modified to remove connections to the service road west of Old Griffin Road. This modification reduces the number of connections at the intersection from five (existing) to four (proposed).
- Restrict access on the northbound approach (DCOTA) to right turns only. Existing northbound left turn movements are rerouted east along Old Griffin Road and utilize a proposed new U-turn facility to access westbound Griffin Road.
- A new roadway is proposed on the north side of the intersection that will provide direct connection from WB Old Griffin Road to NB I-95.
- Access from WB Old Griffin Road to WB Griffin Road is signalized. This will allow safe and efficient access for movements from WB Old Griffin Road to SB I-95 ramps as well as traffic continuing west on Griffin Road.
- Signal control is maintained for Griffin Road eastbound through movement, westbound left/U-turns and right turn movements exiting the properties on the south side on the intersection (DCOTA).
- Modify segment of Old Griffin Road to one-way westbound. This flow modification will improve safety by reducing conflicts for the circulating traffic coming from DCOTA and travelling to WB Griffin Road and NB I-95. In addition, drivers making this circulating movement have limited sight distance to vehicles travelling southbound on Old Griffin Road (under the Griffin Road Bridge). This creates a potential crash risk which is mitigated by restricting traffic on Old Griffin Road to one-way westbound.
- In conjunction with the proposed one-way movement on Old Griffin Road, the existing westbound right turn movement on Griffin Road is prohibited. Vehicles making the WBR movement are rerouted to make a U-turn using the left turn lanes to access southbound Old Griffin Road.

A detailed operations analysis was conducted for Alternative 3 using the Vissim microsimulation models that were developed for the project (see Section 7 of the SIMR). The results of the microsimulation analysis indicate that under Alternative 3 the signalized intersection will operate at an estimated LOS B with no extensive queueing nor delays on any approach. Based on these findings and initial feedback from stakeholders, Alternative 3 was selected as the candidate Preferred Alternative at the time of this writing. However, consultation with stakeholders was still on-going at the time of this writing. The Preferred Alternative for the Griffin Road/Old Griffin Road intersection will be updated in future project documents pending decisions reached from the on-going consultation with stakeholders.



- Diamond Interchange additional turn lanes at the terminal intersections
- NB Off-Ramp – 3 LT + 3 RT Lanes
- SB Off Ramp – 3 LT + 3 RT Lanes
- LOS D – AM and PM peak
- Limited ROW acquisition required

7.0 EVALUATION OF PREFERRED ALTERNATIVE AND NO BUILD

This section describes the Preferred Alternative resulting from the PD&E Study. The discussion includes a comparative assessment of the anticipated traffic operating conditions in Opening Year (2030) and Design Year (2050) for the No Build Alternative and the Preferred Alternative. Traffic Operating conditions in 2030 are assessed using the Highway Capacity Software (HCS) for I-95 freeway segments and Synchro models for intersection operations. A more detailed assessment of the 2050 conditions is provided using Vissim microsimulation models.

7.1 Preferred Alternative Road Network

Based on recommendations from the I-95 PD&E Study and the assessment of the corridor mainline and interchange and intersection alternatives presented in the preceding section of the SIMR, a Preferred Alternative was determined for road network within the area of influence of the SIMR. The road network for the Preferred Alternative is depicted in **Figure 7-1 and Figure 7-2**. Preliminary plans for the Preferred Alternative are contained under **Appendix D**. The Preferred Alternative incorporates the following proposed road improvements:

Northbound I-95: The Preferred Alternative introduces a new elevated braided ramp for the NB express lanes egress serving Sheridan Street and locations north of Sheridan Street. This braided ramp merges with the general use (GU) lanes north of Sheridan Street Off-Ramp where it adds an auxiliary lane to the mainline which continues north and terminates north of the I-595 Off-Ramp. In addition, an auxiliary lane is introduced between Hollywood Boulevard and Sheridan Street. The Off-Ramps at Sheridan Street, Stirling Road and Griffin Road are also widened to two lanes.

Southbound I-95: The Preferred Alternative adds one auxiliary lane along SB I-95 beginning at the Griffin Road Off-Ramp and terminating as a drop lane at the at Hollywood Boulevard Off-Ramp. In addition, the Sheridan Street Off-Ramp is widened from 1 to 2 lanes.

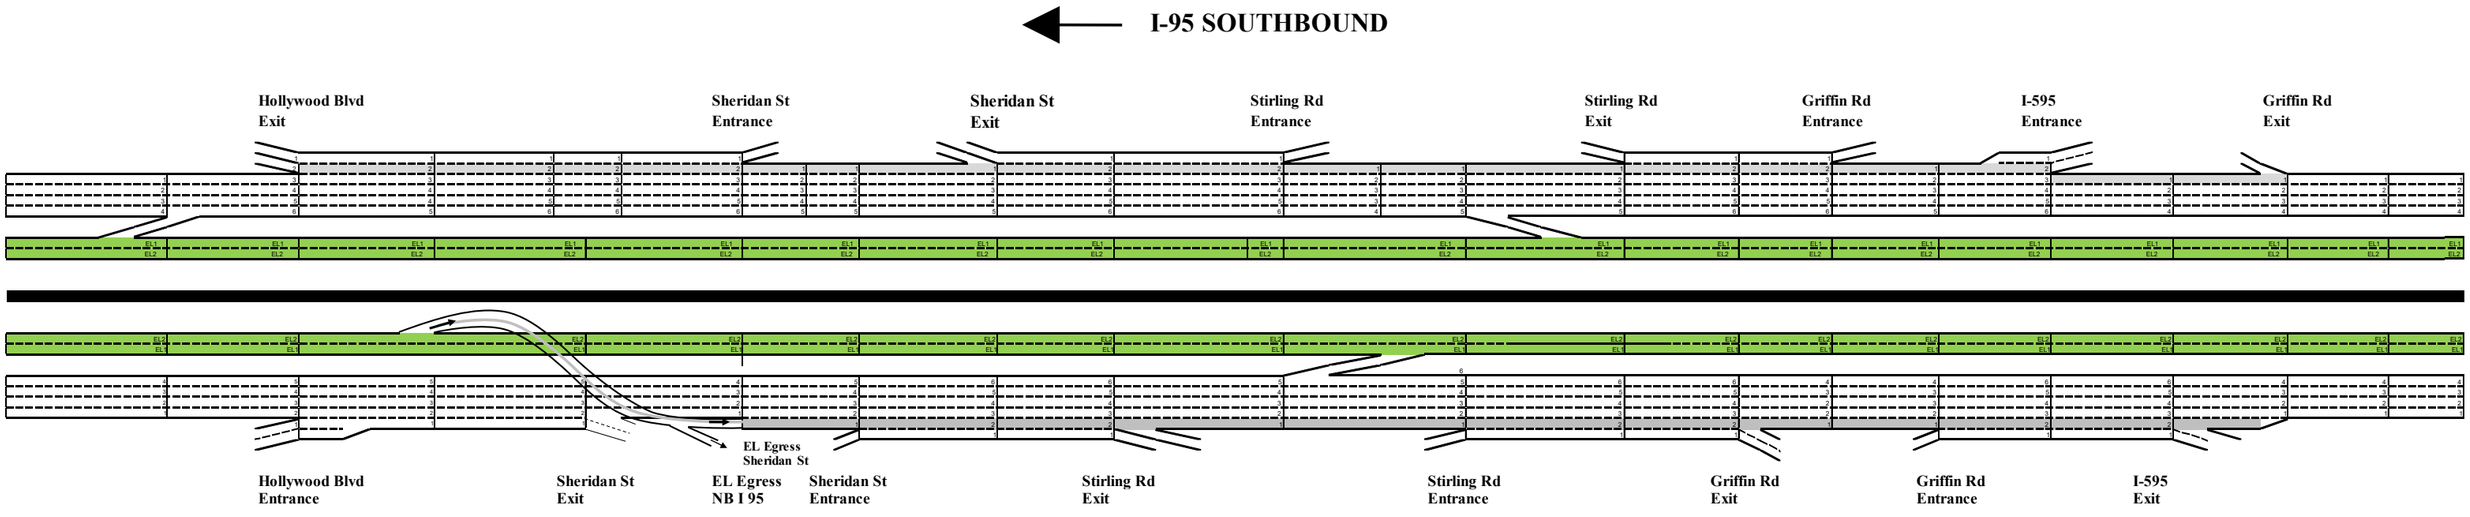
I-95 at Sheridan Street Interchange: The Preferred Alternative modifies the existing diamond interchange. The northbound off-ramp is widened to accommodate 3 left turn lanes and 3 right turn lanes. The southbound off-ramp is widened similarly to accommodate 3 left turn lanes and 3 right turn lane.

I-95 at Stirling Road Interchange: The Preferred Alternative introduces a new Diverging Diamond Interchange (DDI) at I-95 and Stirling Road. The proposed DDI accommodates 4 eastbound lanes and 4 westbound lanes within the crossover segments of the interchange. The northbound and southbound ramp terminals each accommodate two right turn lanes and two left turn lanes. One free flowing right turn lane is provided for the eastbound and westbound right turns (on-demand pedestrian signals available to facilitate occasional pedestrian movements).

I-95 at Griffin Road Interchange: The Preferred Alternative modifies the existing diamond interchange. The northbound off-ramp is widened to accommodate 3 left turn lanes and 2 right turn lanes. The southbound off-ramp is similarly widened to accommodate 3 left turn lanes and 2 right turn lanes. In addition, the eastbound and westbound approaches are widened to accommodate two right turn lanes.

Griffin Road at Old Griffin Road Intersection: The Preferred Alternative modifies the intersection configuration to provide free flow conditions for eastbound traffic on Griffin Road. The design modifications include the following:

- The north leg of the intersection is modified to remove connections to the service road west of Old Griffin Road. This modification reduces the number of connections at the intersection from five (existing) to four (proposed). Removal of connections to the existing service road was coordinated with the Fort Lauderdale/Hollywood International Airport.
- Restrict access on the northbound approach to right turn only. Existing northbound left turn movements are rerouted east along Old Griffin Road and utilize a proposed new U-turn facility to access westbound Griffin Road.
- A new roadway is proposed on the north side of the intersection that will provide direct connection from WB Old Griffin Road to NB I-95.
- Access from WB Old Griffin Road to WB I-95 is signalized. This will allow safe and efficient access for movements from WB Old Griffin Road to SB I-95 ramps as well as traffic continuing west on Griffin Road.
- Eastbound movements on Griffin Road operate under free flow conditions. The free flow condition will optimize traffic operations along EB Griffin Road.
- Westbound left turns from Griffin Road are modified to operate under yield control.



Proposed Aux Lane

Express Lane

7.2 2030 Traffic Operations Analysis

This following describes the anticipated 2030 traffic operating conditions for the No Build and the Preferred Alternative. Traffic analyses were performed using Highway Capacity Software (HCS) for freeway segments and Synchro models for intersections.

2030 Traffic Volumes

Operations analysis for the Opening Year (2030) were performed utilizing traffic forecast presented in Section 5.0 of the SIMR for the No Build Alternative. Travel Demand for the Preferred Alternative is assumed to match the traffic forecast for the No Build Alternative. Link volumes are reassigned accordingly in the Preferred Alternative to match proposed design modifications. **Figure 7-3** illustrates the resulting 2030 AM and PM hour volumes along I-95 mainline for the Preferred Alternative with No Build volumes reassigned to match the proposed northbound elevated braided ramp in the build condition.

2030 I-95 Mainline Traffic Operations

The Highway Capacity Software (HCS) was used to evaluate the I-95 operating conditions for the No Build and Preferred Alternative under 2030 traffic conditions. The mainline was segmented into basic segments, merge, diverge and weaving segments per HCM procedures. Traffic densities and associated level of service for the freeway segments were extracted from the HCS models. Outputs from HCS are contained under **Appendix E** and results for the No Build Alternative and Preferred Alternative are summarized in **Figure 7-4** and **Figure 7-5,** respectively.

Results of the HCS operations analysis indicate that several segments of I-95 mainline will experience failing conditions (LOS F) by Opening Year (2030) under No Build conditions. These locations include.

- Northbound I-95 weaving segment between Sheridan Street On-Ramp and Stirling Road Off-Ramp. Traffic operations within this weaving segment are at LOS F in both the AM and PM peak periods.
- Northbound weaving segment between Stirling Road On-Ramp and Griffin Road Off-Ramp. Traffic operations within this weaving segment are at LOS F in both the AM and PM peak periods.
- Southbound I-95 at I-595 On-Ramp. Traffic operations within this merging segment are at LOS F in both the AM and PM peak periods,
- Southbound I-95 weaving segment between Griffin Road On-Ramp and Stirling Road Off-Ramp. Traffic operations within this weaving segment are at LOS F in both the PM peak period.

Results from the 2030 HCS traffic operations analysis indicate that operating conditions along I-95 are substantially improved with the Preferred Alternative. As depicted in the lane schematic (**Figure 7-5**), no failing segments (LOS F) are expected along I-95 in the AM nor PM peak periods. Traffic operations are at LOS D or better throughout NB and SB I-95 except for the weaving segment between Sheridan Street On-Ramp and Stirling Road Off-Ramp (LOS E).

2030 Intersection Traffic Operations

Synchro models were used to evaluate 2030 traffic operating conditions at the ramp terminal intersections and adjacent intersections within the area of influence of the SIMR for the No Build and Preferred Alternative. The Synchro models apply HCM procedures for evaluating intersection LOS analysis. It should be noted that whereas HCM 7th Edition procedures were applied as the default for LOS calculations in many circumstances the HCM 7th Edition procedures were not capable of analyzing conditions at the study locations. In these circumstances, HCM 2000 results were reported. Several intersection MOEs were gathered from the Synchro models including LOS, delay, v/c ratios, and queue lengths. These results are summarized in **Tables 7-1** through **7-6**. Detailed output from the Synchro files are contained under **Appendix F**.

Results from the Synchro analysis indicate that several intersections will experience failing conditions (LOS F) by Opening Year 2030 under No Build conditions. These include the following:

I-95 Ramp Terminal Intersections:

- Sheridan Street NB Ramp Terminal Intersection: This intersection will operate at LOS F in the AM and PM peak periods.
- Sheridan Street SB Ramp Terminal Intersection: This intersection will operate at LOS F in the AM and PM peak periods.
- Stirling Road SB Ramp Terminal Intersection: This intersection will operate at LOS F in the AM peak period.
- Griffin Road SB Ramp Terminal Intersection: This intersection will operate at LOS F in the AM and PM peak periods.

Adjacent Intersections

- Stirling Road at South Compass Way: This intersection will operate at LOS F in the AM peak period.
- Stirling Road at SW 18th Avenue: This intersection will operate at LOS F in the PM peak period.
- Griffin Road at Old Griffin Road: This intersection will operate at LOS F in the AM peak period.

Results of the Synchro Analysis indicate that traffic operations are substantially improved under the Preferred Alternative at the intersections where improvements are proposed. This includes all the I-95 ramp terminal intersections and the intersection of Griffin Road and Old Griffin Road. Under the Preferred Alternative, all ramp terminal intersections operate at LOS D or better in the AM and PM peaks and Griffin Road/Old Griffin Road intersection operates at LOS A/B in the AM/PM peaks. The LOS at other adjacent project intersections where no improvements are proposed remain the same under No Build and the Preferred Alternative.

NOTES:
(1) Results reported from Synchro 12 HCM6th Edition report.
(2) Results reported from Synchro 12 HCM2000 report, since HCM6th Ed and HCM2010 reports not capable of reporting results.
(3) Results reported from Synchro 12 Lanes, Volumes, Timings report, since HCM6th Ed report not capable of reporting results.
- 95th percentile volume exceeds capacity, queue may be longer.
m - Volume for 95th percentile queue is metered by upstream signal.
* - shared right and through lane
** - shared left and through lane
*** - shared left and right turn lane
**** - shared left, through and right turn lane

7.3 2050 Traffic Operations Analysis

This following describes the anticipated 2050 traffic operating conditions for the No Build and the Preferred Alternative. Traffic analyses were performed using Vissim microsimulation modes.

The Design Year 2050 Vissim models analyzed four-hour AM and PM peak periods. Peak-hour traffic forecasts were developed using SERPM as discussed in Section 5.3. Travel Demand for the Preferred Alternative is assumed to match the traffic forecast for the No Build Alternative. Link volumes were reassigned accordingly in the Preferred Alternative to match proposed design modifications. **Figure 7-6** illustrates the resulting 2050 AM and PM hour volumes along I-95 mainline for the Preferred Alternative with No Build volumes reassigned to match the proposed northbound elevated braided ramp in the build condition.

Fifteen-minute flow rates were used to develop the four-hour AM and PM peak period Vissim models. The Design Year 2050 simulation model parameters are based on those used for the Existing Year 2021 calibrated model. The simulation time consisted of a 30-minute seed time to load traffic into the network, followed by a 4-hour peak period consisting of a preceding shoulder hour, the peak hour, and two subsequent off-peak hours. The purpose of the off-peak hours was to allow all or most of the congestion built during the peak hour to subside during the simulation period.

An additional update to the Design Year 2050 Vissim models is the Tri-Rail train schedule. The Existing Year 2021 Vissim analysis utilized a 2015 Tri-Rail train schedule. A 2025 Tri-Rail train schedule has since been released. The Design Year 2050 Vissim analyses utilize the 2025 Tri-Rail train schedule which resulted in an increase of one train in the AM Peak Period and two trains in the PM peak period when compared to the 2015 Tri-Rail train schedule. The 2025 Tri-Rail train schedule is contained in **Appendix G**.

The following MOEs were used to evaluate the network's operational performance:

- Freeways
  - Travel Speed
  - Simulated (Throughput) Volume
  - Estimated Density
  - Estimated LOS
- Intersections
  - Volume
  - Delay
  - Max Queue Length
- Network-Wide Performance
  - Total Travel Time
  - Total Delay Time
  - Average Delay
  - Latent Delay
  - Vehicle-miles of Travel
  - Average Speed
  - Latent Demand
  - Vehicles Arrived
  - Total Stops

The MOEs listed above were used to compare the operational performance of the 2050 No-Build and Preferred alternatives. **Appendix H** contains supplemental simulation output related to the intersection performance for each analysis alternative. The following sections provide a summary of the operational performance based on the Vissim modeling results.

2050 Peak Period Results Overview

The lane schematics presented in the following discussion provide an operational overview of the freeway facilities during the peak hours of each simulation. Therefore, the speed, density and throughput presented in these figures only represents data collected during the peak hour (Hour 2) of the simulations. The speed and volume profiles also presented in the following discussion provide operational results for all four hours of simulation to illustrate buildup and dissipation of the congestion that occurs during the peak period.

Figure 7-7 shows the 2050 No-Build results for the AM peak hour. During the AM peak hour, a bottleneck occurs at the first on ramp, the Hollywood Boulevard/ Pembroke Road C-D system on ramp. Speeds as low as 18 mph occur in all four hours of simulation (See **Figure 7-8**) and approximately 10% of downstream I-95 mainline traffic volume is metered by this location. The weave segment between the Sheridan Street on ramp and Stirling Road off ramp also experiences turbulence with speeds reaching approximately 51 mph in all four hours of simulation.

In the southbound direction, a bottleneck occurs at the first off ramp to Griffin Road. The off ramp to Griffin Road drops a lane and reduces the I-95 mainline to three lanes. Speeds as low as 19 mph occur in Hour 1 of simulation, worsen to 14 mph and 13 mph in Hours 2 and 3, respectively, and only recover to 18 mph in Hour 4. The Stirling Road off ramp also queues on the mainline causing speeds as low as 23 mph in Hours 2 and 3. Approximately 15-20% of downstream I-95 mainline traffic volume is metered by the congestion generated by the Griffin Road off ramp bottleneck and Stirling Road off ramp queueing.

During the PM peak hour (as shown in **Figure 7-9**), a bottleneck similar to the AM Peak Period occurs at the first on ramp, the Hollywood Boulevard/ Pembroke Road C-D system on ramp. Speeds as low as 11-12 mph occur in Hours 2-4 (See **Figure 7-10**) and approximately 8-9% of downstream I-95 mainline traffic volume is metered by this location. The Sheridan Street northbound off ramp queues onto the mainline within Hour 1 and the congestion between the Hollywood Boulevard/ Pembroke Road C-D system on ramp and Sheridan Street off ramp does not recover within the simulation period. The weave segment between the Sheridan Street on ramp and Stirling Road off ramp experiences turbulence with a low speed of 53 mph in Hour 2. The Griffin Road off ramp experiences queueing on the mainline primarily when there is a train event restricting the northbound left green time.

In the southbound direction, similar to the AM Peak Period, a bottleneck occurs at the first off ramp to Griffin Road. The off ramp to Griffin Road drops a lane and reduces the I-95 mainline to three lanes. Speeds as low as 15 mph occur in Hour 1 of simulation, worsen to 13 mph in Hours 2 and 3, and only recover to 15 mph in Hour 4. Approximately 15-20% of downstream I-95 mainline traffic volume is metered by the congestion generated by the Griffin Road off ramp bottleneck. Despite the volume metering, each weave segment experiences turbulence within Hour 1. By the end of Hour 1, the shockwave of congestion primarily created by the Sheridan Street to Hollywood Boulevard/Pembroke Road C-D system weave segment cascades upstream and does not recover within the simulation period. Speeds as low as 30 mph were observed within

the Sheridan Street to Hollywood Boulevard/ Pembroke Road C-D system weave segment and the Stirling Road to Sheridan Street weave segment. Speeds as low as 23 mph were observed within the Griffin Road to Stirling Road weave segment influence area.

Figure 7-11 shows the 2050 Preferred Alternative results for the AM peak hour. These results show significant improvements over the No-Build Alternative resulting from the proposed improvements to I-95 mainline and interchanges. I-95 northbound operates at 55 mph or better for all four hours of simulation throughout the project area (see **Figure 7-12**). The bottleneck at the Hollywood Boulevard/ Pembroke Road C-D system on ramp was relieved by braiding and shifting the express lane egress that releases upstream of the C-D system on ramp in the No-Build Alternative to the right side of I-95 and downstream of the Sheridan Street off ramp in the Preferred Build. The right side ramp also adds an auxiliary lane that terminates at the I-595 off ramp. The braided express lane ramp removes approximately 1,100 vehicles from the I-95 mainline in the peak hour from the Hollywood Boulevard/ Pembroke Road C-D system to Sheridan Street weave segment. Approximately 97% of the I-95 mainline and express lane demand is processed at the northern end of the network.

In the southbound direction, I-95 operates at 58 mph or better. The bottleneck at the Griffin Road off ramp was relieved by not dropping a travel lane at the Griffin Road off ramp and instead continuing it as an auxiliary lane to be dropped at the Hollywood Boulevard/ Pembroke Road C-D system off ramp. The Stirling Road off ramp does not queue on the mainline due to the improvement of converting the interchange configuration into a diverging diamond interchange (DDI). Approximately 99% of the I-95 mainline and express lane demand is processed at the southern end of the network.

During the 2050 PM peak (as presented in **Figure 7-13**), the Preferred Alternative results show significant improvements over the No-Build Alternative with I-95 northbound operating speeds at 57 mph or better for all four hours of simulation throughout the project area (see **Figure 7-14**). The bottleneck at the Hollywood Boulevard/ Pembroke Road C-D system on ramp was relieved by the braided express lane ramp and its relocated right side merge north of the Sheridan Street off ramp. The braided express lane ramp removes approximately 1,100 vehicles from the I-95 mainline in the peak hour from the Hollywood Boulevard/ Pembroke Road C-D system to Sheridan Street weave segment. The Sheridan Street off ramp does not queue on the mainline due to adding an additional left and right turn lane at the northbound ramp terminal resulting in three left turn lanes and three right turn lanes. The Griffin Road off ramp average maximum queue length no longer reaches the mainline due to the addition of a left turn lane and increased storage with the improvement of a two-lane off ramp enabling train event induced queueing to be better maintained on the ramp. Approximately 99% of the I-95 mainline and express lane demand is processed at the northern end of the network.

In the southbound direction, I-95 operates at 55 mph or better for all four hours of simulation. The bottleneck at the Griffin Road off ramp was relieved by not dropping a travel lane at the Griffin Road off ramp and instead continuing it as an auxiliary lane to be dropped at the Hollywood Boulevard/ Pembroke Road C-D system off ramp. Approximately 99% of the I-95 mainline and express lane demand is processed at the southern end of the network.

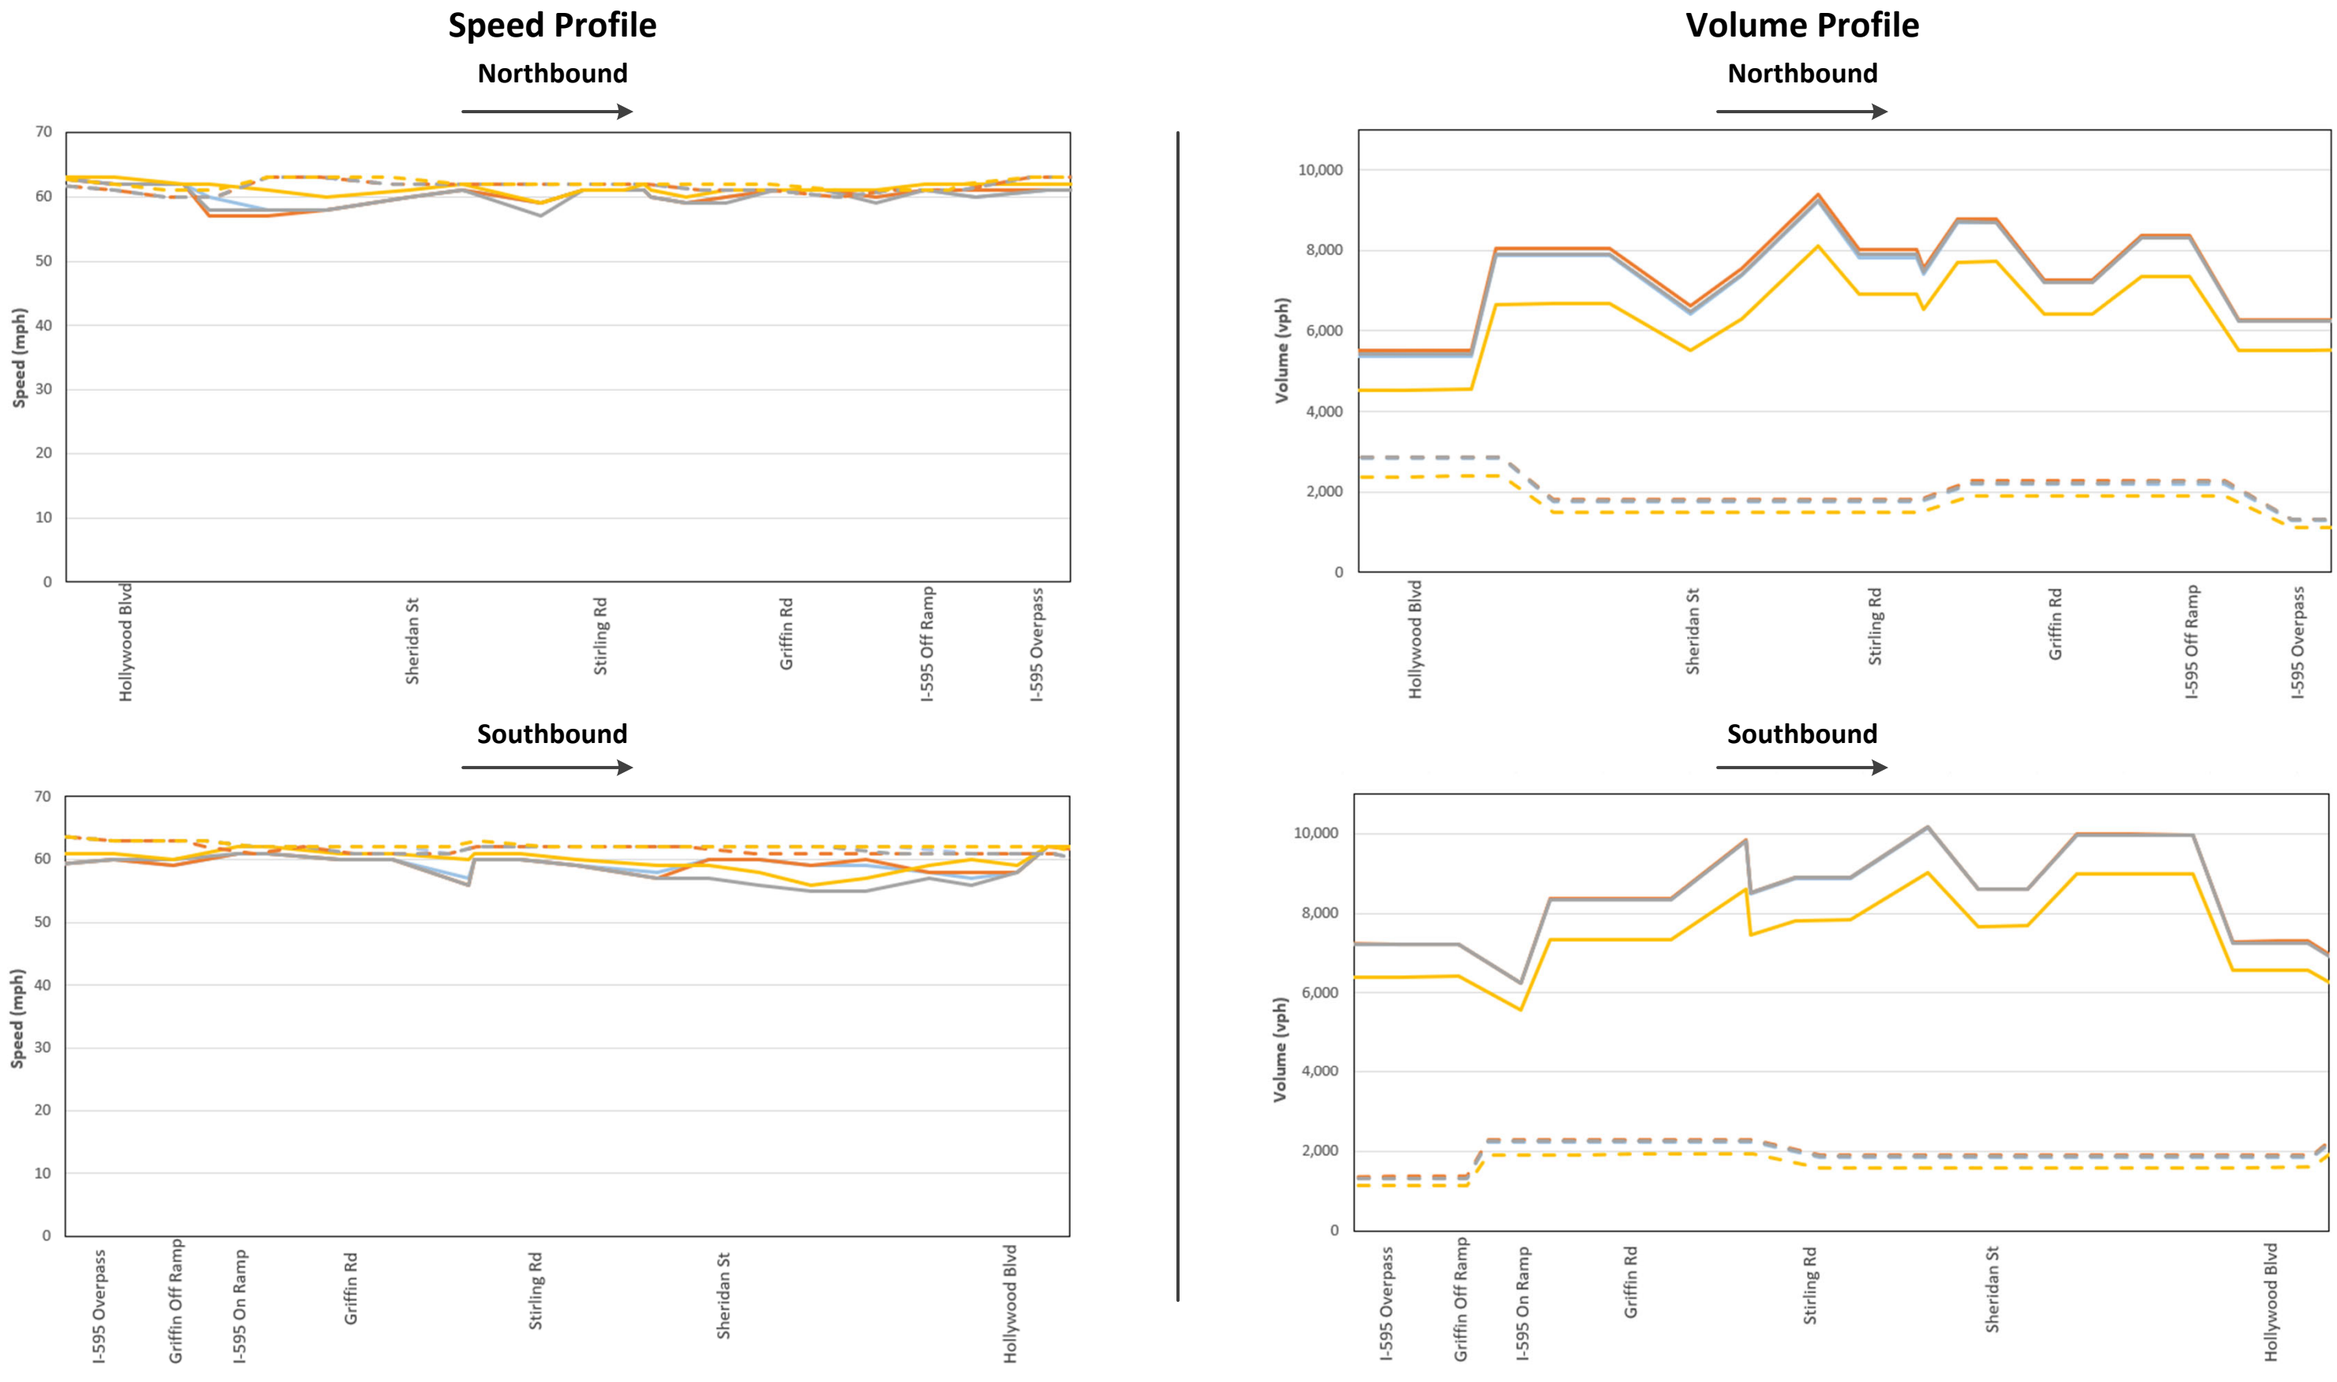

Figure 7-14 – Design Year 2050 Preferred Alternative PM Peak Period Speed and Volume Profiles

2050 Interchange Queue Length Analysis

Tables 7-7 and **Table 7-8** contain the No-Build and Preferred alternatives queue length comparison, respectively. In the tables, the ramp length is measured from the stop bar to the gore point with the freeway with adjustment for deceleration, where applicable. If the off-ramp consists of an auxiliary lane which is adequate to accommodate deceleration from freeway speed to stop condition, then no adjustments were made to the ramp length. This condition is typical for parallel type off-ramps. If the off-ramp type does not accommodate deceleration, then the total ramp length was reduced by the minimum deceleration distance, in accordance with AASHTO Greenbook, **Table 10-5**. This condition is typical for taper type off-ramps.

In the No-Build Alternative, three ramps have maximum queues that are not contained within the ramp length in either the AM peak hour or PM peak hour. These queues exceed the ramp length and spill onto I-95 which compromises the safety of vehicles traveling on the mainline.

- Sheridan Street northbound off ramp (PM Peak)
- Stirling Road southbound off ramp (AM Peak)
- Griffin Road northbound off ramp (PM Peak)

In the Preferred Alternative, all maximum queue lengths are contained within the ramp length in both peak hours.

Table 7-8 2050 Preferred Alternative Interchange Queue Length

Ramp Location	Approach/ Movement		Ramp Length (ft)	2050 AM Peak			2050 PM Peak

	NB	R	1,670	1,188	91%	No	1,479	93%	No
	SB	L	5,190	726	75%	No	568	76%	No
	SB	R	5,190	717	77%	No	559	77%	No

2050 Study Intersection Performance

The performance of the study area intersections was evaluated as part of the VISSIM analysis. Signal optimization was performed to account for the 2050 peak-hour volumes. The Design Year 2050 intersection delay results are summarized in **Table 7-9**. Additional details for the intersection analysis are provided in **Appendix H.** It should be noted that the level of service (LOS) reported from the Vissim analysis are approximate values based on delays gathered from the Vissim models and using the Highway Capacity Manual (HCM) LOS thresholds. Since delays are computed differently in Vissim and HCM, the LOS estimates reported using Vissim data may differ from LOS computed using HCM procedures.

Table 7-9 2050 Intersection/Interchange Analysis Summary

Intersection[1]	No-Build Alternative				Preferred Alternative			
	AM Peak		PM Peak		AM Peak		PM Peak	
	Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Sheridan Street at 29th Avenue	156.2	F	72.5	E	**158.9**	F	70.2	E
Sheridan Street at I-95 SB Terminal	19.4	B	25.6	C	**22.7**	C	**33.1**	C
Sheridan Street at I-95 NB Terminal	56.4	E	89.3	F	45.9	D	59.1	E
Sheridan Street at 28th Avenue[2]	120.2	F	80.7	F	82.0	F	63.9	F
Sheridan Street at 26th Avenue	141.7	F	142.8	F	126.8	F	127.3	F
Stirling Road at Anglers Avenue	105.5	F	51.1	D	96.8	F	**57.9**	E
Stirling Road at 29th Avenue	77.2	E	34.9	C	42.6	D	34.4	C
Stirling Road at I-95 SB Terminal	112.8	F	59.8	E	39.3	D	33.6	C
Stirling Road at I-95 NB Terminal	37.2	D	33.6	C	35.4	D	28.1	C
Stirling Road at Oakwood Boulevard	75.8	E	98.8	F	68.2	E	91.8	F
Stirling Road at Compass Way	18.0	B	56.5	E	16.2	B	45.7	D
Stirling Road at Bryan Road	10.1	B	90.1	F	**10.2**	B	52.6	D
Griffin Road at Anglers Avenue	166.2	F	152.0	F	124.9	F	55.0	D
Griffin Road at I-95 SB Terminal	65.4	E	62.2	E	41.4	D	38.6	D
Griffin Road at I-95 NB Terminal	34.1	C	48.9	D	31.5	C	38.0	D
Griffin Road at Old Griffin Road	26.6	C	40.0	D	8.9	A	14.3	B

[1]Values that have red, bolded text are instances where the Preferred Alternative intersection delay is greater than the No-Build intersection delay.
[2]Indicates an unsignalized intersection reporting the highest movement delay (LOS) for the stopped controlled approach.

Delays are reduced at almost all I-95 ramp terminal intersections in the Preferred Alternative when compared to the No-Build Alternative. The I-95 southbound ramp terminal at Sheridan Street increases by less than 10 seconds of intersection delay in both peak hours. However, the No-Build Alternative meters traffic volume on I-95 southbound from reaching the Sheridan Street interchange. The Preferred Alternative processes 99% of the southbound ramp approach volume depending on the peak hour which results in 15-16% more processed volume than the No-Build Alternative.

In addition, all but three arterial intersections adjacent to the ramp terminals in the Preferred Alternative operate with lower intersection delay than the No-Build Alternative. Of the three adjacent intersections that have higher intersection delay in the Preferred Alternative, the difference is not operationally significant. Additionally, there is a small increase in traffic volume (average approximately 6%) processed at each of these intersections in the Preferred Alternative, which contributes to slightly higher delays.

2050 Network-Wide Performance

Table 7-10 summarizes the network-wide performance results for the No-Build and Preferred alternatives during the 2050 AM and PM peak periods. Comparison of the alternatives shows that the Preferred Alternative consistently exhibited better performance than the No-Build Alternative in terms of delay, average speed, number of stops and latent demand.

In terms of average speed, the Preferred Alternative shows better performance than the No-Build during both peak periods with speed increases of 28% (AM) and 46% (PM). Total delay time reductions for the Preferred Alternative were 42% (AM) and 53% (PM). Significant improvements were realized for the total travel time, latent delay/demand, and total stops. This upholds the results observed in the previous sections, in which the Preferred Alternative alleviated the majority of the congestion present in the No-Build simulations.

Table 7-10 2050 Network-Wide Performance

AM PEAK	No Build	Preferred Alternative	Percent Difference
Average Speed (mph)	29	37	28%
Total Delay (hr)	10,132	5,881	-42%
Latent Delay (hr)	31,563	6,852	-78%
Latent Demand	10,511	1,535	-85%
Total Travel Time (hr)	19,917	16,484	-17%
Total Stops	1,139,831	415,190	-64%
Vehicles Arrived	153,203	162,199	6%
Vehicle Miles Traveled	567,548	612,190	8%
Average Delay (s)	233	129	-45%
PM PEAK	**No Build**	**Preferred Alternative**	**Percent Difference**
Average Speed (mph)	26	38	46%
Total Delay (hr)	11,771	5,563	-53%
Latent Delay (hr)	27,176	4,097	-85%
Latent Demand	9,870	753	-92%
Total Travel Time (hr)	21,685	16,489	-24%
Total Stops	1,455,299	374,138	-74%
Vehicles Arrived	156,508	166,240	6%
Vehicle Miles Traveled	573,449	630,645	10%
Average Delay (s)	263	118	-55%

8.0 SAFETY

This section discusses the anticipated safety performance of the Preferred Alternative and No Build. It includes a qualitative safety assessment and a quantitative safety assessment based on the Highway Safety Manual (HSM) predictive crash procedures.

8.1 Qualitative Safety Assessment

A qualitative safety assessment was performed comparing the Preferred Alternative and the Build Condition. The qualitative assessment considered various improvements introduced in the Preferred Alternative and their anticipated impact on safety when compared to No Build. Notable design changes in the Preferred Alternative which are expected to have a positive impact on safety included the following:

1. Modifying the I-95 interchanges to improve traffic operations at the ramp terminal intersections. The improvements in traffic operations at the ramp terminal intersections will reduce queuing along the ramps and provide additional storage. These improvements will mitigate the risk of queues spilling back from the ramp terminals onto I-95 mainline which occurs under the No Build condition. This will provide significant operational and safety improvements along the I-95 corridor, particularly reducing the risk of rear-end collisions. It is also notable that rear-end crashes involving standing queues on the mainline have a high crash severity risk due to high speed differentials. Hence, the interchange improvements are expected to have a positive impact on reducing fatalities and serious injury crashes along the I-95 corridor.
2. Widening I-95 mainline to introduce new auxiliary lanes along NB I-95 (Sheridan Street to I-595 Off-Ramp) and SB I-95 (Griffin Road off-ramp to Hollywood Boulevard off-ramp). The traffic analyses presented in the preceding section of the SIMR confirm that addition of these auxiliary lanes will provide congestion relief along I-95 mainline with substantially improvement in traffic operating conditions when compared to No Build. These improvements in traffic operations will yield a corresponding reduction in congestion-related crashes, particularly rear-end crashes and side-swipe crashes which are the leading crash types on the I-95 corridor.

   The improvement in traffic operations in I-95 GU lanes will also provide substantial safety benefits for traffic operations in the express lanes with the Preferred Alternative. Under No Build Condition, congestion in the GU lanes create queueing at the express lanes egress points which spillback and impact traffic operations in the express lanes. The presence of standing queues in the express lanes create a potential high crash risk condition. The Preferred Alternative mitigates this crash risk by alleviating congestion in the GU lanes.

3. Widening the off-ramps at the service interchanges from one to two lanes with the inside lane at the gore point being a choice lane to either exit I-95 or continue through along the mainline. This improvement reduces the number of lane change maneuvers within the weaving segments between adjacent on-ramps and downstream off-ramps along I-95. Hence, it is anticipated that this improvement will enhance traffic operations and reduce crash risk within the weaving segments, particularly sideswipe crashes and rear-end crashes.
4. Modifying the northbound express lane slip egress serving Sheridan Street from a slip ramp design (No Build) to an elevated braided ramp (Preferred Alternative). The slip ramp design requires vehicles exiting the express lanes to make multiple lane changes (4 total) to access Sheridan Street Off-Ramp. These multiple lane changes impact traffic operations and increase crash risk within the I-95 corridor. These operational impacts and crash risk are mitigated by the braided ramp incorporated in the Preferred Alternative.

Based on the discussion presented above, it is expected that implementation of the Preferred Alternative will yield a substantial reduction in crashes when compared to the No Build Alternative.

8.2 Quantitative Safety Assessment

A quantitative safety analysis was performed for the I-95 mainline, ramps and interchanges per the Highway Safety Manual (HSM) predictive crash procedures. Consistent with the FDOT's Interchange Access Request (IAR) User's Guide Safety Analysis Guidance, an initial step in the process was to assess the applicability of the Predictive Method for evaluating the future safety performance of the project study area under No Build and Build conditions. This assessment included detailed reviews of the FDOT's IAR User Guide Safety Analysis Guidance, the HSM Part C Methodology and current publications from NCHRP and FHWA related to the Predictive Method and analysis tools. From this assessment, a key limitation of the Predictive Method was noted which limits its applicability for evaluating the future No Build and Build conditions. The limitation is the following:

- The procedure does not perform safety analysis for freeway segments that are managed lanes. This limitation is relevant to this project given that express lanes will be present in both No Build and Build conditions.

In addition to the above, the current HSM procedures cannot capture congestion experienced in the express lanes at the slip ramp egress locations where congestion in the GU lanes may spill back into the express lanes and create a potential high crash risk involving standing queues in the express lanes. This condition is particularly concerning for the No Build condition. Due to these limitations, analysis of the express lanes was excluded in the quantitative safety assessment.

Another relevant limitation noted in the Predictive Method, involved the AADTs along segments, ramps and interchanges within the study area which exceeded the applicable range of the safety performance functions currently developed for the Predictive Method. It should also be noted that the Empirical Bayes method is not applicable for this study as the Existing (2021) Conditions differ significantly from the No Build and Preferred Alternative. Application of the Empirical Bayes Method and calibration factors would enhance the accuracy of the crash prediction process.

Based on the above limitations, for the purposes of this study, the application of the Predictive Method was taken to serve only as an indicator to assess the relative safety performance of the study area under the future No Build and Preferred Alternative scenarios.

Crash predictions for the future No Build and Preferred Alternative scenarios were computed using the Interactive Highway Safety Design Module (IHSDM). This software tool automates the calculations in Part C of the HSM. The analysis required gathering various input data for the study area segments ranging from geometric elements, alignments, cross section data, roadside and ramp access data and annual average daily traffic (AADT) data for facilities that included I-95, I-95 Ramp Sections and the arterial segments of Sheridan Street, Stirling Road and Griffin Road. These procedures were used to compare the predicted crashes for a

20-year period between Opening Year (2030) and Design Year (2050) under No Build and Preferred Alternative scenarios.

It should be noted that two key Crash Modification Factors (CMFs) were incorporated into the Predictive Method analysis to account for the Preferred Alternative improvements. These CMFs were applied at the interchange level to capture the following improvements.

- **CMF 3948 – Install left-turn lane**: Applicable at the Griffin Road Interchange and Sheridan Street Interchange
- **CMF 10761** – Convert a Diamond Interchange to a Diverging Diamond Interchange (DDI): Applicable at the Stirling Road Interchange

Conducting the predictive analysis for the study area requires segmentation of the study area into homogeneous segments per the HSM methodology. Segmentation is automated based on user inputs when utilizing the IHSDM tool. Details regarding the segmentation can be found in the IHSDM output reports contained in **Appendix I.** The results are summarized in Table 8-1 below.

The results of the predictive crash analysis indicate that the Preferred Alternative will perform better than the No Build conditions with an estimated 14% reduction in crashes. This result is consistent with the expectations due to the following points:

- Proposed added lane along northbound and southbound I-95 triggers the use of a safety performance function with greater capacity which improves predicted safety along the mainline.
- Proposed two-lane off-ramps along northbound and southbound I-95 triggers the use of a safety performance function with greater capacity to Sheridan Street, Stirling Road, and Griffin Road, which improves predicted safety.
- Proposed improvements at the interchanges of Sheridan Street, Stirling Road and Griffin Road improve predicted safety. The proposed DDI at Stirling Road has fewer conflict points (18) when compared to existing diamond interchange and the DDI also has less lanes (reduced exposure) when compared to the diamond interchange.
- The removal of the weaving area from the northbound express lane egress to the northbound Sheridan Street Off-Ramp improves predicted safety.

The results from the quantitative safety analysis are consistent with the qualitative safety assessment confirming that the proposed improvements under the Preferred Alternative are expected to reduce crashes throughout the I-95 corridor when compared with the No Build Condition.

Table 8-1: Predicted Crashes - No Build and Preferred Alternative

Facility	Facility Type	No-Build Predicted Crashes 2030 - 2050	Preferred Alternative Predicted Crashes 2030 - 2050	Comparison (% crash reduction)
I-95	Freeway	9,374	8,658	-8%
Hollywood Blvd	Service Ramps	252	247	-2%
Sheridan Street Ramps		164	165	1%
Stirling Road Ramps		150	131	-12%
Griffin Road Ramps		155	138	-11%
Ramps to I-595		341	341	0%
Sheridan Street Interchange	Arterial and Terminal Intersections	1298	572	-56%
Stirling Road Interchange		905	879	-3%
Griffin Road Interchange		1235	803	-35%
Total		**13,875**	**11,935**	**-14%**

9.0 OTHER CONSIDERATIONS

9.1 Planning Consistency

The improvements proposed in the SIMR for the Preferred Alternative are consistent with improvement plans incorporated in Florida's Strategic Intermodal System (SIS) Second Five Year (2030 – 2035) and the 2026 – 2029 State Transportation Improvement Program (STIP). The proposed improvements are also included in the current 2050 Cost Feasible Metropolitan Transportation Plan (MTP), adopted by Broward County, Metropolitan Planning Organization (MPO), December 12, 2024. In addition, the improvements are also incorporated in the MPO's 2026 – 2030 Transportation Improvement Program (TIP).

9.2 Anticipated Design Exceptions and Variations

The Preferred Alternative is being evaluated to identify any anticipated design exceptions and variations for implementing the proposed improvements. At the time of this writing, this evaluation was still on-going. Based on preliminary analysis conducted to date, potential design variances and exceptions are:

- Shoulder width variation
- Shoulder width exception
- Lane width exception
- Length of crest vertical curve within an interchange variation
- Border width variation
- Potential ramp horizontal curve length variation.

9.3 Conceptual Signing Master Plan

A conceptual signing master plan is being prepared to support the proposed improvements in the Preferred Alternative. At the time of this writing, the conceptual signing master plan was still under development. It will be included in subsequent update of this SIMR.

10.0 JUSTIFICATION FOR PROJECT

The section offers a discussion on the justification for the proposed improvements for compliance with Title 23 CFR Part 624.7 Interstate System (23 CFR Part 624). Compliance with 23 CFR Part 624 is required for FHWA approval of proposed modifications to the Interstate System.

10.1 Compliance with Title 23 CFR Part 624.7 Interstate System Requirements

The following Title 23 CFR Part 624.7 Interstate System Requirements serve as the primary decision criteria used in the approval of interchange modification projects. Responses to each of the requirements, as applicable, are provided to show that the proposed modification for the study interchange is viable based on the conceptual analysis performed to date.

10.1.1 Requirement a

The proposed change in access to the Interstate System shall not result in a significant adverse impact on the Interstate System traffic operations or the safety for all users of the transportation system in the project's area of influence, as demonstrated by operational and safety analyses based on both the current and future traffic projections using traffic data that is no more than 5 years old and at least the most recent 3 years of available safety data

An in-depth operational and safety analysis was conducted to study the impacts of the proposed modifications at the I-95 system within the limits of the SIMR extending from the Hollywood Boulevard to north of Griffin Road and including the interchanges at Sheridan Street, Stirling Road, and Griffin Road. The operational analysis was performed using traffic that was validated to ensure reasonableness of the Southeast Regional Planning Model (SERPM). The safety analysis was performed for the most recent safety data available at the initiation of this PD&E Study. A qualitative safety analysis and quantitative safety analysis following the High Safety Manual procedures were used for comparing the anticipated safety performance of the No Build and Preferred Alternative. Several performance measures were used to compare the traffic operations of the No-Build and Preferred Alternative. Microsimulation analysis was performed to compare traffic operations of the alternatives in Design Year 2050 while the Highway Capacity Manual procedures were used for Opening Year (2030) analysis.

From an operational perspective, simulation results indicate that the Preferred Alternative provides substantially better traffic operating conditions when compared to the No Build Alternative through to Design Year 2050.

Interchange Operations: In the Preferred Alternative LOS is improved at all the ramp terminal intersections and delays are reduced. Anticipated traffic operations in the design year (2050) at the ramp terminal intersections are as follows (highest delays reported):

- **Sheridan Street Interchange:** Delays at the ramp terminal intersections in the AM/PM peak hours are reduced from approximately 56.4/86.8 secs/veh. (LOS E/LOS F) under No Build to approximately 46.5/59.0 secs./veh (LOS D/LOS E) under the Preferred Alternative. In addition, under the No Build Alternative queues on the NB ramp will exceed the available storage in the PM peak whereas under the Preferred Alternative queues on the ramps are contained within the available storage in both AM and PM peak periods.
- **Stirling Road Interchange**: Delays at the ramp terminal intersections in the AM/PM peak hours are reduced from approximately 112.8/59.5 secs/veh. (LOS F/LOS E) under No Build to approximately 38.7/32.3 secs./veh (LOS D/LOS C) under the Preferred Alternative. In addition, under the No Build Alternative queues on the SB ramp will exceed the available storage in the AM peak whereas under the Preferred Alternative queues on the ramps are contained within the available storage in both AM and PM peak periods.
- **Griffin Road Interchange**: Delays at the ramp terminal intersections in the AM/PM peak hours are reduced from approximately 65.4/62.6 secs/veh. (LOS E/LOS E) under No Build to approximately 41.5/38.5 secs./veh (LOS D/LOS D) under the Preferred Alternative. In addition, under the No Build Alternative queues on the NB ramp will exceed the available storage in the PM peak whereas under the Preferred Alternative queues on the ramps are contained within the available storage in both AM and PM peak periods.

I-95 Mainline Operations: In the Preferred Alternative, average operating speeds are significantly increased along I-95 in both the northbound and southbound directions. In the AM peak (2050 conditions), the No-Build Alternative experiences areas with substantial congestion in the northbound direction resulting in operating speeds below 20 mph. Similarly, in the southbound direction the No Build experiences substantial congestion with operating speed below 20 mph. In contrast, under the Preferred Alternative, operating speed in the AM peak period are above 45 mph in both the northbound and southbound directions. In addition, the Preferred Alternative process more traffic 97%/99% (northbound/southbound) compared to the No Build alternative 90%/80/% Northbound/southbound.

In the PM peak (2050 conditions), the No-Build Alternative experiences areas with substantial congestion in the northbound direction resulting in operating speeds below 20 mph. Similarly, in the southbound direction the No Build experiences substantial congestion with operating speed below 20 mph. In contrast, under the Preferred Alternative, operating speeds in the AM peak period are above 50 mph in both the northbound and southbound directions. In addition, the Preferred Alternative process more traffic 99%/99% (northbound/southbound) compared to the No Build alternative 91%/80/% Northbound/southbound.

Safety: Review of historical crash data confirmed that the I-95 study segment is a high crash corridor with abnormally high crash rates reported in 4 of the 5 years between January 2018 and December 2022. In addition, the corridor has a high risk for severe crashes with 17 fatalities and 85 serious injury crashes reported over the 5-year period. The Preferred Alternative incorporates several improvements that will reduce crash risk when compared to the No Build Alternative. These include:

1. Modifying the I-95 interchanges to improve traffic operations at the ramp terminal intersections. These improvements will mitigate the risk of crashes resulting from queues spilling back from the ramp terminals onto I-95 mainline which occurs under the No Build condition.
2. Widening I-95 mainline to introduce new auxiliary lanes along NB I-95 (Sheridan Street to I-595 Off-Ramp) and SB I-95 (Griffin Road off-ramp to Hollywood Boulevard off-ramp). This improves traffic operations along I-95 mainline and will yield a corresponding reduction in congestion-related crashes, particularly rear-end crashes and side-swipe crashes which are the leading crash types on the I-95 corridor. It will also reduce the risk of queuing at the express lanes egress points which occurs under No Build and creates a crash risk in the express lanes.

3. Widening the off-ramps at the service interchanges from one to two lanes with the inside lane at the gore point being a choice lane to either exit I-95 or continue through along the mainline. This improves safety by reducing weaving maneuvers between adjacent on-ramps and downstream off-ramps along the mainline.
4. Modifying the northbound express lane slip egress serving Sheridan Street from a slip ramp design (No Build) to an elevated braided ramp (Preferred Alternative). This improves safety by eliminating the need for vehicles exiting the express lanes to make multiple lane changes (4 total) to access Sheridan Street Off-Ramp.

A quantitative safety assessment conducted for the corridor estimated a crash reduction of approximately 15% for resulting from improvements proposed under the Preferred Alternative. These results confirm that the Preferred Alternative is expected to substantially improve safety conditions within the I-95 corridor when compared to the No Build Alternative.

10.1.2 Requirement b

Interstate System access points shall connect only to a public road. Connections directly to private developments, parking lots, or private roads are prohibited.

The study interchanges all provide full access to the cross streets (Sheridan Street, Stirling Road, and Griffin Road) and will continue to do so with the Preferred Alternative. Griffin Road Interchange and Stirling Road Interchange will provide no direct connections to private developments, parking lots, or private roads. In the case of the Sheridan Street Interchange, an existing direct connection is provided in the southwest corner accessing a parking lot that connects to the Sheridan Street Tr-Rail Station. This connection to the Tri-Rail parking lot will be maintained in the Preferred Alternative.

10.1.3 Requirement c

Connections from outside of the Interstate System right-of-way to safety rest areas, information centers, weigh stations, and truck inspection stations located within the Interstate System right-of-way are prohibited.

The study interchanges all provide full access to the cross streets (Sheridan Street, Stirling Road and Griffin Road) and will continue to do so with the Preferred Alternative No connections from outside of the Interstate System right-of-way to safety rest areas, information centers, weigh stations and truck stations located within the Interstate System right-of-way will be provided.

10.1.4 Requirement d

Each interchange shall provide for all traffic movements.

The Preferred Alternative will maintain and provide interchange access to Sheridan Street, Stirling Road, and Griffin Road catering to all traffic movements to/from I-95.

10.1.5 Requirement e

A proposed change in access shall be designed to meet the standards in accordance with 23 CFR 625 or have approved exceptions and shall comply with 23 CFR 655.

The proposed improvements will be designed to meet all applicable FDOT design standards. Design variations or exceptions will be requested if the applicable design standards are not met for any element of the proposed improvements. The proposed improvements could potentially involve the following design variations and exceptions:

- Shoulder width variation
- Shoulder width exception
- Lane width exception
- Length of crest vertical curve within an interchange variation
- Border width variation
- Potential ramp horizontal curve length variation.

IARs only need to address Requirement f if it is attempting to use one of the exceptions listed below.

10.1.6 Requirement f

On a case by case basis, FHWA may grant exceptions to the Requirements b through d for:

1. *Locked gate access to private property for purposes of public safety;*
2. *Locked gate access from an information center, weigh station and truck inspection station to a local road for the purposes of public safety;*
3. *Access from a safety rest area to an adjacent publicly owned conservation and recreation area if access to this area is available only through the safety rest area as allowed under 23 CFR 752.5(d);*
4. *Locked gate access from a local public road to the safety rest area for the limited purpose of providing access to safety rest area employees, deliveries, and emergency vehicles; or*
5. *A partial interchange where necessary to provide special access, such as to managed lanes or park and ride lots, or where factors such as the social, economic, and environmental impacts of a full interchange justify an exception*

This IAR is not requesting to make use of any of the exceptions listed above under Requirement f. As a result, addressing Requirement f is not required for this IAR.

11.0 CONCEPTUAL FUNDING PLAN/CONSTRUCTION SCHEDULE

The project is included in the 2050 Broward County Metropolitan Planning Organization (MPO) Metropolitan Transportation Plan (adopted December 12, 2024), 2026-2030 Transportation Improvement Program (TIP), 2026 – 2029 State Transportation Improvement Program (STIP), Florida's Strategic Intermodal System (SIS), Second Five Year Plan (2030 – 2035). The design phase is partially funded in the 2026-2030 FDOT Work Program under FPID project numbers:

- FPID# 439170-3, I-95 from SR 820/Hollywood Boulevard to N of SR 822/Sheridan Street
- FPID# 439170-4, I-95 from SR 822/Sheridan Street to N of SR 848/Stirling Road
- FPID# 439170-5, I-95 from N of SR 874/Stirling Road to N of DR 818 Griffin Road
- FPID# 439170-6, I-95 CD Road from N of SR 820/Hollywood Boulevard to N of SR 818 Griffin Road
- FPID# 439170-7, I-95 Express Lanes from Miami-Dade /Broward Countyline to N of SR 818/Griffin Road

Construction cost for the project is estimated at $389,225,300 and right-of-way acquisition is estimated at $19,813,800. The right of way and construction phases are not currently funded. The project is anticipated to be funded with federal and state funds. The project is proposed to be phased into five projects. A funding plan will be developed based on the results, costs, and recommendations from the PD&E Study. The project is in the 2026-2030 FDOT Five-Year Work Program with funds allocated for the PD&E and Preliminary Engineering phases. Funding for future phases is currently being coordinated to ensure that the project is consistent with the local government comprehensive plans, and that required project funding is identified in the MTP, TIP, STIP, and FDOT's Work Program.

1.0 Project Description

Provide background or supporting information that explains the basis for the request.

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study along the segment SR 9/I-95 extending from the Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). The PD&E Study limits extend along SR 9/I-95 for approximately 6.5 miles in Broward County, Florida. The project proposes to address deficiencies and improve safety and traffic operations at the existing interchanges and cross streets and enhance the express lanes along SR 9/I-95 from the Miami-Dade/Broward County Line to north of Griffin Road. Modifications are proposed at the three northern interchanges within the PD&E Study Limits - SR 818/Griffin Road, SR 848/Stirling Road, and SR 822/Sheridan Street. FDOT is preparing a Systems Interchange Modification Report (SIMR) to support the proposed modifications to these three interchanges. The limits of the SIMR extend from south of Sheridan Street to north of Griffin Road (covering the 3 northern interchanges of the PD&E Study). This document serves as the Methodology Letter of Understanding (MLOU) that outlines the criteria, assumptions, processes (analyses), and documentation requirements for preparation of the SIMR. The SIMR will serve as the Project Traffic Analysis Report (PTAR) for the related National Environmental Policy Act (NEPA) study encompassing the three interchanges and associated arterial improvements.

This SIMR is being prepared in coordination with the adjacent FDOT PD&E Study (FM No.436903-1-22-02) which is implementing modifications to the I-95 interchanges at Hollywood Boulevard, Pembroke Road and Hallandale Beach Boulevard. FDOT is preparing a separate SIMR to support the interchange modifications associated with this adjacent PD&E Study. Also notable is the 95 Express Phase 3C project which is currently under construction. This project is implementing express lanes along I-95 with direct connect ramps to and from I-595.

Modifications to the I-95 express lanes system may be considered under the I-95 PD&E Study extending from Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). These potential express lanes modifications may be prepared through the available optional services that are included in the project scope of services. If the optional services are advanced and modifications to the I-95 express lanes system are proposed, a separate Corridor Traffic Analysis Report (CTAR) will be prepared which will encompass all proposed improvements to the interchanges (6 total) and the I-95 mainline segment extending from Miami-Dade/Broward County Line to north of Griffin Road.

A. Purpose and Need Statement

Provide the Purpose, the Need, and the Goals and Objectives.

Traffic Demand (primary)

The year 2021 Annual Average Daily Traffic (AADT) along the SR-9/I-95 project limits ranged between 198,500 vehicles and 256,000 vehicles. This is slightly lower than pre-COVID conditions which had a 2019 AADT between 213,000 vehicles and 267,000 vehicles. Based on the traffic projections prepared for the project, the traffic demand is projected to continue increasing at a rate of 0.5% per year. The projected 2050 AADT was estimated to be between 248,000 vehicles and 333,400 vehicles. The proposed improvements include addressing existing and future traffic demand.

Operational Deficiencies (primary)

The SR 9/I-95 project interchanges, ramp terminals, and cross streets within the project limits are over-saturated. Traffic analysis was conducted for each interchange as part of the FDOT District 4 Interchange Concept Development Report from 2016. According to the study, the following locations are operating at Level of Service (LOS) E or worse during existing conditions (year 2012/2013):

- SR 848/Stirling Road: I-95 northbound ramp terminal intersection
- SR 822/Sheridan Street: I-95 Northbound ramp terminal intersection

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

The future analysis, which projected traffic demand to the year 2040, describes the following locations that are expected to operate at LOS E or worse:

- SR 818/Griffin Road: All I-95 ramp terminal intersections
- SR 848/Stirling Road: I-95 Northbound ramp terminal intersection
- SR 822/Sheridan Street: All I-95 ramp terminal intersections
- I-95 southbound freeway segments within the project limits: Eight segments
- I-95 northbound freeway segments within the project limits: Four segments

Safety (primary)

A historical crash evaluation of the SR 9/I-95 project limits revealed a total of 4,764 crashes observed over a five-year period between 2016 and 2020. Approximately 0.5% of these crashes were fatal and 38.5% were coded with injuries. This is higher than the Districtwide statistics for the period from 2015 to 2019 which shows approximately 0.4% fatal crashes and 28.9% involving injuries. The predominant crash types along the project corridor consisted of rear ends at 52.4%, followed by sideswipes at 20.8% and crashes coded as other at 20.8%. The lane departure crash types such as those involving barriers comprised 11.5% of the crashes. The rear end crash types are higher than the Districtwide statistic of 33.4%. Higher rear end crash types may be correlated to congestion.

The Broward MPOs 2045 LRTP depicts the SR 9/I-95 project limits as a top corridor for future safety studies due to its high severity index per mile of over 200. The results are similar for the interchange cross streets at SR 822/Sheridan Street, SR 848/Stirling Road, and SR 818/Griffin Road. The severity index is a measure that looks at total crashes and crash severity and uses a weighted average (higher score for incapacitating and fatal crashes) to develop an index that ranks locations in terms of their importance for future safety analysis and improvements. The 2021 Florida Strategic Highway Safety Plan (FSHSP) has identified lane departure crashes as an emphasis area which is a high crash type along the project corridor. Pedestrians, bicyclists and intersections are another emphasis area which applies to the interchange areas. The proposed improvements include operational improvements at the interchanges which are expected to alleviate crash patterns that are correlated to congestion. Improvements at the cross streets are anticipated to enhance bicycle and pedestrian accommodations which may also alleviate crash patterns related to those modes.

SR 9/I-95 and the project interchanges are designated evacuation routes according to the Florida Division of Emergency Management and Broward County. The proposed project improvements will address operational deficiencies which will help to improve travel time during evacuation events and emergency situations.

Social Demands and Economic Development (secondary)

SR 9/I-95, which is part of the Florida Strategic Intermodal System (SIS), supports the regional social and economic development activity in South Florida. The facility connects the major employment and population centers in Broward County, Miami-Dade County, and Palm Beach County. According to the Broward MPO 2045 LRTP, the County's population is projected to grow 27% between the years 2015 and 2045. Similarly, employment is projected to increase 25% in that same time period. Urban infill and redevelopment are common in the region and in the vicinity of the project limits. The proposed improvements will enhance connectivity to nearby employment areas, schools, and recreational facilities.

Modal Interrelationships (secondary)

SR 9/I-95 is part of the SIS which is a high priority network of transportation facilities important to the state's economy and mobility. The corridor is a primary highway in the National Highway Freight Network. The truck factor varies but is approximately 9% within the SR-9/I-95 project limits. The limited access corridor also services several premium express transit routes for Broward County Transit and Miami-Dade County Department of Transportation and Public Works Metrobus system. All of the project interchange areas include sidewalks on both sides of the arterials passing underneath the SR 9/I- 95 bridges. Generally, there is a lack of dedicated bicycle facilities. The Broward MPO Complete Streets Master Plan (dated 2019) confirms the gaps in the existing

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

bicycle network along the project interchange cross streets. This master plan proposes a bicycle facility project along SR 818/Griffin Road and complete streets projects along SR 848/Stirling Road and SR 822/Sheridan Street.

The proposed improvements will address operational deficiencies at the interchanges and improve access to the managed lanes system which is expected to improve traffic flow along the SR 9/I-95 corridor benefiting all users including freight and premium express bus transit. Improvements at the interchange ramp terminals and arterial cross streets are expected to benefit multiple modes such as vehicles, freight, transit, bicyclists and pedestrians.

B. Project Location

Provide project description and a map of the IAR project location.

A location map for the project is shown in Figure 1. The PD&E Study limits extend from Miami-Dade County Line to north of Griffin Road, Broward County Florida. The limits of the PD&E Study are within the City of Hollywood, City of Dania Beach, Town of Pembroke Park, and City of Hallandale Beach. Six interchanges are within the limits of the PD&E Study - Hallandale Beach Boulevard, Pembroke Road, Hollywood Boulevard, Sheridan Street, Stirling Road and Griffin Road. The three northern interchanges (Sheridan Street, Stirling Road and Griffin Road) are within the limits of the SIMR which is the subject of this MLOU.

C. Area of Influence

Provide a description of the area of influence along the main line and cross street.

The area of influence for the SIMR is depicted in Figure 2. It extends along I-95 from south of Sheridan Street to north of Griffin Road. The limits along I-95 include the ramps serving Hollywood Boulevard to and from the north and the ramps serving I-595 to and from the south. The ramp connections to I-595, within the area of influence, are not expected to have any impact on the I-595/I-95 Interchange. The area of influence includes three I-95 interchanges: Sheridan Street, Stirling Road and Griffin Road. All freeway segments (merge, diverge, basic and weaving segments) within the area of influence will be analyzed. The area of influence extends along each cross-street to include adjacent signalized intersections located within approximately 1/2 mile of the interchange. The signalized intersections within these limits are:

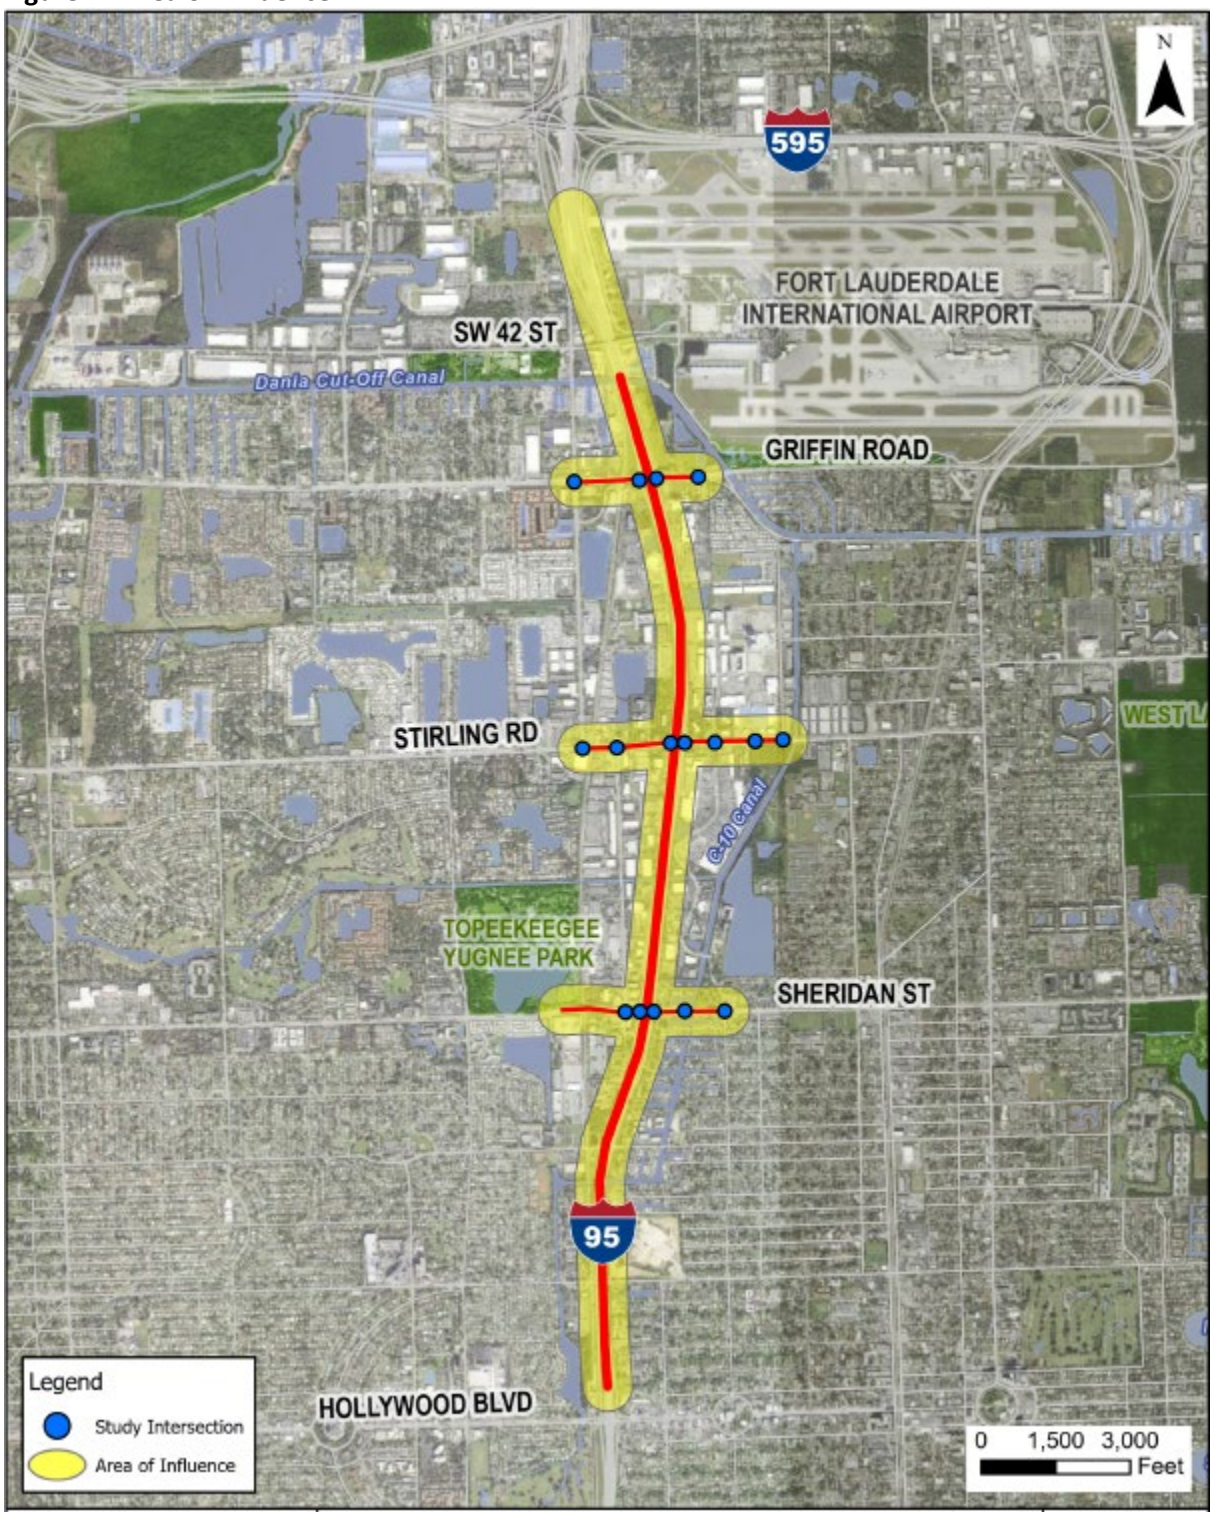
- Sheridan Street at N 29th Avenue
- Sheridan Street at N 28th Avenue
- Sheridan Street at SB I-95 Off-Ramp
- Sheridan Street at NB I-95 Of-Ramp
- Sheridan Street at N 26th Avenue
- Stirling Road at Anglers Avenue
- Stirling Road at NW 29th Avenue
- Stirling Road at SB I-95 Off-Ramp
- Stirling Road at NB I-95 Off-Ramp
- Stirling Road at SW 18th Avenue/Oakwood Boulevard
- Stirling Road at South Compass Way
- Stirling Road at Bryan Road
- Griffin Road at Anglers Avenue
- Griffin Road at SB I-95 Off-Ramp
- Griffin Road at NB I-95 Off Ramp
- Griffin Road at Old Griffin Road

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

Figure 1: Project Location Map

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

Figure 2: Area of Influence



DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

D. Project Schedule

Identify the schedule of production activities consistent with a proposed conceptual funding plan and opening year.

Funding in the amount of $6,016,042 was programmed for the PD&E Study under Fiscal Year (FY) 2023 in the FY 2018 - 2023 FDOT Work Program (FM #439170-1). The project is funded for Preliminary Engineering (Final Design) with an allocation of $50,020,000 under FY 2026 in the FDOT Work Program FY 2024 – 2028. Location Design Concept Acceptance (LDCA) for the PD&E Study is expected circa January 2026. The anticipated opening year for the project is 2030, subject to construction funding.

2.0 Analysis Years

A. Travel Demand Model

- Base year: 2015
- Horizon year: 2045

B. Traffic Operational Analysis

- Existing year: 2021 (consistent with FDOT's pre-work activities)
- Opening year: 2030
- Interim year: 2040
- Design year: 2050

A year of failure analysis shall be performed for Preferred Alternative, in case a failing LOS is obtained in Design Year.

3.0 Alternatives

The No-Build and Build alternatives shall be analyzed in the IAR. Details of all reasonable build alternatives considered, including those eliminated from further considerations, shall be documented. The documentation for the alternatives eliminated can be minimal like a summary of what was considered, reasons for elimination etc. Build Alternatives meeting purpose and need of the project shall have a more detailed description and evaluated in the IAR. The implementation of TSM&O elements will be incorporated in the IAR Recommended Alternative.

4.0 Data Collection

The type of data that may be used should be identified.

A. Transportation System Data

Transportation system data will be gathered from various sources, including the following*:*

- *Field review conducted along the project corridors.*
- *Review of aerial photographs*
- *Broward County Public Works Department*
- *FDOT Roadway Characteristic Inventory Database*
- *FDOT Traffic Information Online*
- *Signal4Analytics*
- *Prior and other on-going studies conducted within the project area, most notably:*
    - *I-95 PD&E Study from Miami-Dade County Line to Hollywood Boulevard*
    - *I-95 Express Phase 3*
    - *I-95 PD&E Study from Golden Glades Interchange to Miami-Dade/Broward County Line.*

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

B. Existing and Historical Traffic Data

Existing and historical traffic will be gathered from various sources including the following:

- *Traffic Data Collection and Traffic Projections report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, May 20, 2022. The is the pre-work traffic information prepared by FDOT for the PD&E Study. This document will serve as the primary traffic data source for the project.*
- *FDOT Traffic Information Online*
- *RITIS and other available BIG Data sources*
- *Broward County*
- *Active DRIs and other major developments*
- *Traffic Reports for adjacent projects*
    - *I-95 PD&E Study from Miami-Dade County Line to Hollywood Boulevard*
    - *I-95 Express Phase 3*
    - *I-95 PD&E Study from Golden Glades Interchange to Miami-Dade/Broward County Line.*

C. Land Use Data

Existing and Future land use data will be gathered from various sources, such as, Florida Geographic Data Library (FGDL), Broward County MPO 2045 Metropolitan Transportation Plan (MTP), local government comprehensive plans and any active development of regional impact (DRI) applications or other major developments within the project vicinity.

D. Environmental Data

Environmental data will be gathered from the FGDL and through coordination with local, state, and national agencies, these include:

- Broward County
- Florida Department of Environmental Protection
- South Florida Water Management District
- US Army Corps of Engineers
- US Fish and Wildlife Service
- Florida Fish and Wildlife Commission
- US Environmental Protection Agency

E. Planned and Programmed Projects

Planned and programmed projects will be identified in consultation with the FDOT, Broward County, other stakeholders and reviewing the following documents:

- Broward County MPO 2045 Metropolitan Transportation Plan (MTP)
- Miami-Dade County MPO TIP and Priority Projects
- Local government comprehensive plans
- Active DRI applications and other major developments
- FDOT's Five Year Work Program
- FDOT's Strategic Intermodal System plans
- *I*-95 PD&E Study from Miami-Dade County Line to Hollywood Boulevard (on-going project)
- I-95 Express Phase 3 (on-going Design-Build project)
- I-95 PD&E Study from Golden Glades Interchange to Miami-Dade/Broward County Line (on-going project)

The SIMR will be prepared in coordination with all planned and programed projects for consistency.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

5.0 Travel Demand Forecasting

Travel demand forecast prepared by the FDOT for this project is documented in the Traffic Data Collection and Traffic Projections report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, May 20, 2022. This report contains traffic forecasts for the existing year - 2021 (AM, PM, AADT) and AADT forecast for future years (2030, 2045, 2050) No Build conditions. The information contained in this report will be utilized in developing the forecasts for the Build Alternatives.

A. *Selected Travel Demand Model(s)*

The Southeast Florida Regional Planning Model (SERPM), Version 8.531 was used for the travel demand forecasting for this project. SERPM 8.531 is an Activity-Based Model (ABM) that simulates both household level and person-level travel choices including intra-household interactions with household members. SERPM 8.531 model is validated to year 2015 conditions and includes a future year 2045 scenario based on the adopted Cost Feasible plans from the Miami-Dade, Broward, and Palm Beach MPOs. It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies. The RTTAC-MS comprises representatives from FDOT District 4, District 6, and the three MPOs in South Florida.

B. *Project Traffic Forecast Development Methodology*

Describe the methodology and assumptions in developing the future year traffic volumes (AADT and DDHV)

The AADT volumes were developed based on existing traffic counts and growth factors. The growth factors were determined from 2015 and 2045 model volumes, historical traffic counts, and socioeconomic growth in the study area. The AADT volume, applicable K factors and D factors, together with existing turning movement counts will be used as input into the TmTool application to calculate future year turning movement volumes for No Build and Build conditions.

C. *Validation Methodology*

Describe the validation methodology using current FDOT procedures and data collection procedure.
Identify how modifications to the travel demand forecasting model will be made, including modifications to the facility type and area type for links, modifications to socio-economic data and all input and output modeling files for review.

The SERPM 8.531 model was previously validated to year 2015 conditions following the standard model validation procedures, principles, and best practices in the industry. No further model validation task is required for this SIMR.

D. *Adjustment Procedures*

Identify the process used to adjust modeled future year traffic to the defined analysis years. Discuss how trends/growth-rates will be factored into this, if applicable.

AADT projections were prepared by FDOT for the future years (2030, 2045 and 2050) under the No-Build conditions. Based on the coordination with the FDOT, the No Build conditions are defined as the transportation network with the inclusion of Cost Feasible Plan improvements in the adopted MPO 2045 Long Range Transportation Plan (LRTP). In addition, the preferred alternative from the I-95 PD&E study from Hallandale Beach Boulevard to Hollywood Boulevard is included as part of the No-Build conditions. The travel demand forecasts performed by FDOT included the following activities:

• **Data Gathering for Project Traffic from Past Studies:** The traffic projections and forecasts were gathered for the following 3 adjacent projects:

1. I-95 PD&E Study from Hallandale Beach Boulevard to Hollywood Boulevard PD&E
2. I-95 Corridor Planning Study led by FDOT District 4, and
3. I-95 PD&E study from Miami Garden Drive to Miami/Broward County Line led by District 6.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

Coordination was carried out with the I-95 Express Team and the Teams for the above referenced I-95 PD&E Studies. This coordination was essential to ensure that traffic projections and improvements from various sources are all considered.

• **Subarea Model Forecast for No-Build Conditions:** The socioeconomic data, network coding, and other model settings were reviewed to make sure they were consistent with the base year (2021) conditions. A future year (2045) No-Build Network in Southeast Florida Regional Planning Model (SERPM) was developed based on the 2045 Cost Feasible Plans adopted by the three MPOs in the region. The No-Build network also included the proposed improvements from the aforementioned projects and was coordinated with FDOT.

• **Future Traffic Projections**: Trends analysis was conducted using the historical traffic counts. The growth factors were calculated using the population and employment data obtained from the SERPM model. A set of recommended growth rates were proposed based on the trends analysis, socioeconomic data, and model volumes for all links within the study network. The growth rates were applied to the existing year (2021) AADT volumes to obtain projections for the future years 2030, 2045 and 2050. Coordination was carried out to ensure the AADT projections at the county line along I-95 were consistent with the AADT forecast prepared by the I-95 PD&E Team south of the Miami-Dade County line. Traffic volumes for the interim year (2040) will be developed by interpolating data from the FDOT's traffic projections.

E. *Traffic Factors*

Recommended traffic factors were developed for the study network based on the following considerations:

- The 2022 Florida Traffic Online (FTO) data was used to compute estimated K factors (per peak/daily ratios from the synopsis reports) and D factors in the year 2022. The computed 2022 K factors are relatively low (6.7 to 7.5) along I-95 and several of the cross-street approaches. This condition is typical for the highly urbanized nature of the study area with peak spreading conditions that extend for several hours during the AM and PM peak periods.
- Traffic factors previously approved for adjacent projects were reviewed for consistency along I-95 mainline. K factors ranging from 6.2% to 6.8% were previously approved for the adjacent PD&E Study along the segment of I-95 from Hallandale Beach Boulevard to Hollywood Boulevard.
- FDOT provided new recommendations for K factors per e-mail distributed to the districts on July 27, 2023. The new guidelines allow for K factors ranging from 7.0% to 9.0% in highly urbanized areas. K factors in the lower range are applicable for roadways with extensive peak spreading characteristics, similar to the road network in the SIMR study area.
- The FDOT's 2019 Project Traffic Forecasting Handbook recommended D factors for urban freeways (50.4% to 61.2%) and urban arterials (50.8% to 67.1%) were reviewed for consistency.
- The 2022 FTO data was researched to gather classification counts within the project vicinity for each corridor (I-95, Griffin Road, Stirling Road and Sheridan Street). Truck factors (T Factor) were established based on the classification counts data. Design Hour Truck (DHT) factors were estimated at ½ T-factor and rounded to nearest whole number.
- Peak hour factors for existing year (2021) will be computed based on existing year counts. A peak hour factor of 95% will be assumed for future years (2030, 2040 and 2050) - consistent with guidelines for urban freeways and arterials, per FDOT's Traffic Analysis Handbook.

Based on the above considerations, recommended K factors and D factors were established for the project, as presented in the table below.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

I-95 Corridor								
From	**To**	**K Factor**		**D Factor**		**T Factor**	**DHT**	**PHF**
		AM	**PM**	**AM**	**PM**			
Hollywood Boulevard	Sheridan Street	7.0%	7.0%	51.6%	52.3%	5.0%	3.0%	varies
Sheridan Street	Stirling Road	7.0%	7.0%	52.3%	50.8%	5.0%	3.0%	varies
Stirling Road	Griffin Road	7.0%	7.0%	52.3%	50.8%	5.0%	3.0%	varies
Griffin Road	I-595	7.0%	7.0%	52.3%	50.8%	5.0%	3.0%	varies
Arterial Corridors								
Roadway	**Location**	**K Factor**		**D Factor**		**T Factor**	**DHT**	**PHF**
		AM	**PM**	**AM**	**PM**			
Sheridan Street	West of I-95	7.3%	7.3%	55.8%	54.4%	3.5%	2.0%	Varies
	East of I-95	7.3%	7.3%	52.1%	50.0%	3.5%	2.0%	Varies
Stirling Road	West of I-95	8.0%	8.0%	54.4%	54.3%	4.0%	2.0%	Varies
	East of I-95	7.5%	7.5%	56.6%	53.4%	4.0%	2.0%	Varies
Griffin Road	West of I-95	7.5%	7.5%	55.2%	51.5%	6.5%	3.0%	Varies
	East of I-95	9.0%	9.0%	59.9%	57.1%	6.5%	3.0%	varies

If any of the above traffic factors are modified during the IAR due to additional information becoming available, then CO will be informed and supporting information will be provided in the IAR.

6.0 Traffic Operational Analysis

The area type, traffic conditions, and analysis tools to be used are summarized in this section.

A. Existing Area Type/Traffic Conditions

Area Type	Conditions	
	Under Saturated	Saturated
Rural	☐	☐
Urban Area/Transitioning Area	☐	☒

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

B. Traffic Analysis Software Used

Vissim will be the primary tool used for comparing traffic operations for the No Build and the Recommended Alternative resulting from the PD&E Study. HCS and Synchro will be used for preliminary screening of Build Alternatives and to supplement the simulation output.

Software		System Component					
		Freeway				Crossroad	
Name	Version	Basic Segment	Weaving	Ramp Merge	Ramp Diverge	Arterials	Intersections
HCS/HCM	2023	☒	☒	☒	☒	☐	☐
Synchro	12	☐	☐	☐	☐	☒	☒
Corsim	☐	☐	☐	☐	☐	☐	☐
Vissim	2022	☒	☒	☒	☒	☒	☒
Other	☐	☐	☐	☐	☐	☐	☐

C. Calibration Methodology

- *Calibration methodology and parameters utilized will be documented.*
- *Calibration Measures of Effectiveness (MOEs) and calibration targets.*

Synchro Models:

Synchro models will be developed and calibrated using the criteria adopted from the 2021 FDOT Traffic Analysis Handbook. Synchro model calibration will be conducted per Section 6.4.2 of the 2021 FDOT Traffic Analysis Handbook.

The calibration process will be supported by data gathered during field observations, such as: typical queue lengths, operating speeds, right turns on red, signal operations and pedestrian/bicycle activity.

Vissim Models:

The simulation calibration will incorporate guidance and criteria from the 2021 FDOT Traffic Analysis Handbook. Prior calibration factors used for the adjacent I-95 PD&E study and I-95 Express Lanes projects will also be reviewed. Traffic volume data, travel time data, and field observations will be used in the calibration of the Vissim model. Vissim models will be developed for the existing year (2021) for calibration and for the design year (2050) for comparison of the No Build and Preferred Build Alternative.

Vissim models will be developed covering a total of 4 ½ hours in the AM and PM peak periods using 15-minute flow rates. The simulation periods will include the following:

- AM Period: ½ hour seeding + 4-hour AM peak period
- PM Period: ½ hour seeding + 4-hour PM peak period

Several calibration measures will be used to ensure that the model replicates the field conditions. The calibration process will consist of measuring and comparing volume, speed/travel time, and visual audits. Volumes, travel times, and speeds for freeway mainline and arterial (surface street) facilities will be calibrated using criteria specified in the 2021 FDOT Traffic Analysis Handbook.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

The major bottlenecks within the study area will be calibrated to replicate the capacity and congestion based on field data. Visual audits of the simulation will be performed to analyst's satisfaction to observe speed-flow relationships for individual links and acceptable queuing at intersections and other bottlenecks in the network. In addition to average travel speeds, individual link speeds and speed-flow diagrams will be used to evaluate the performance of the network.

To determine the required number of simulation runs, statistical tests will be performed using a 95% confidence level and an allowable error of 10%. It is anticipated that 10 runs will be adequate based on prior experience within this corridor. Vissim default vehicle characteristics will be used in the model as a starting point. Any parameters that are changed from the default value will be documented and justified accordingly.

All future year Build and No-Build models will be created from the calibrated 2021 existing model.

D. Selection of Measures of Effectiveness (MOE)

- *The Level of Service criteria for each roadway classification, including mainline, ramps, ramp terminal intersections and the crossroad beyond the interchange ramp terminal intersections are identified below.*

  The project study area is located within the urbanized area of Broward County. Hence, a target LOS D will be used for all roadway facilities, per FDOT's Level of Service Policy.

- *In addition to the Level of Service criteria, state other operational MOEs to be utilized for the evaluation of alternatives.*

The following MOEs will be used to evaluate the performance of the considered alternatives:

- Synchro
  - Level of Service – Overall intersection LOS and by movement
  - Delay – Overall intersection control delay and by movement
  - 95th percentile queue lengths
- HCS
  - Basic Freeway Segments – Density and LOS
  - Freeway Merge, Diverge and Weaving Segments – Density and LOS

- Vissim (Design Year only)
  - Freeway: volume, speed, estimated density and estimated LOS
  - Intersections: volume, delay, and max queue length
  - Network-wide: total travel time, total delay time, average delay, latent delay, vehicle-miles of travel, average speed, latent demand, vehicles arrived and total stops.

The Vissim analysis will compare MOEs for the No Build and Preferred Alternative. Vissim MOEs will be assessed for a simulation period covering a total of 4 ½ hours in the AM period and 4 ½ hours in the PM period, as described under Section 6C.

7.0 Safety Analysis

A. Detailed crash data within the study area will be analyzed and documented. The latest five years of crash data shall be used.

Years: January 2018 through July 2023
Source: Signal4Analytics

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

B. Identify the level of safety analysis to be performed, along with any software and tools to be used.

The safety analysis will identify existing safety concerns as reflected in the crash data. The analysis will be conducted per guidelines contained in FDOT's 2022 Interchange Access Request User's Guide, Chapter 6 Safety Analysis Guidance. The safety analysis will incorporate a qualitative assessment as well as a quantitative assessment for the Preferred Alternative and No Build conditions. Historical crash records will be gathered and summarized to identify crash characteristics such as: crash types, severity, lighting conditions, surface conditions and weather conditions. The quantitative safety analysis will be performed per the Highway Safety Manual (HSM) and using the Interactive Highway Safety Design Model (IHSDM) or other analysis tool approved by FDOT for computations. Proposed improvements will incorporate crash countermeasures, to the extent feasible, within the scope of the project.

8.0 Consistency with Other Plans/Projects

A. The request will be reviewed for consistency with facility Master Plans, Actions Plans, SIS Plan, MPO Long Range Transportation Plans, Local Government Comprehensive Plans or development applications, etc.

The proposed improvement under consideration in the SIMR are consistent with the Broward County MPO Metropolitan Transportation Plan (MTP), Broward County Interchanges Master Plan, and FDOT's Strategic Intermodal System (SIS) Plan.

B. Where the request is inconsistent with any plan, steps to bring the plan into consistency will be developed.

The proposed improvements are consistent with all applicable plans.

C. The operational relationship of this request to the other interchanges will be reviewed and documented. The following other IARs are located within the area of influence.

- Systems Interchange Modification Report (SIMR) for I-95 from Hallandale Beach Boulevard to Hollywood Boulevard (on-going)
- I-595 SIMR Reevaluation, 2015, 2017 and 2019. These SIMR reevaluations include I-95/I-595 system-to-system interchange improvements and the 95 Express direct connect ramps which are currently under construction.

9.0 Environmental Considerations

A. Status of Environmental Approval and permitting process.

B. Identify the environmental considerations that could influence the outcome of the alternative development and selection process.

10.0 Coordination

Yes	No*	N/A*	
☒	☐	☐	An appropriate effort of coordination will be made with appropriate proposed developments in the area.
☒	☐	☐	Request will identify and include (if applicable) a commitment to complete the other non-interchange/non-intersection improvements that are necessary for the interchange/intersection to function as proposed.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

☒	☐	☐	Request will document whether the project requires financial or infrastructure commitments from other agencies, organizations, or private entities.
☒	☐	☐	Request will document any pre-condition contingencies required in regards to the timing of other improvements and their inclusion in a TIP/STIP/LRTP prior to the Interstate access approval (final approval of NEPA document).
☒	☐	☐	Request will document the funding and phasing.

**Explain if No or Not Applicable (N/A) is checked*:

11.0 Anticipated Design Exceptions and Variations

Any known exceptions/variations to FDOT, AASHTO or FHWA rules, policies, standards, criteria or procedures will be listed in the IAR document.

Design exceptions/variations are not anticipated at this time. However, should the need arise, they will be documented in the SIMR.

12.0 Conceptual Signing Plan

A conceptual signing and marking plan shall be prepared and included in the access request.

The conceptual signing and marking plan will be prepared consistent with the Manual on Uniform Traffic Control Devices (MUTCD).

13.0 Access Management Plan

☐ *Access management plan within the area of influence will not be changed by the proposed improvements to the interchange.*

☒ *The improvement will affect the access management within the area of influence that will require a change to the access management plan. An access management plan will be developed within the area of influence to complement the improvements to the interchange.*

The interchange modifications may impact access to some properties within the area of influence. If access is impacted, an access management plan will be prepared to compliment the improvements, and this will be documented in the SIMR.

14.0 FHWA Policy Points

The two FHWA policy points will be addressed within the access request.

1.0 PROJECT DESCRIPTION

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study along the segment SR 9/I-95 extending from the Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). The PD&E Study limits extend along SR 9/I-95 for approximately 6.5 miles in Broward County, Florida. The project proposes to address deficiencies, improve safety and traffic operations at the existing interchanges and cross streets, and enhance the express lanes along SR 9/I-95 from the Miami-Dade/Broward County Line to north of Griffin Road. Modifications are proposed at the three northern interchanges within the PD&E Study Limits - SR 818/Griffin Road, SR 848/Stirling Road), and SR 822/Sheridan Street. FDOT is preparing a Systems Interchange Modification Report (SIMR) to support the proposed modifications to these three interchanges. The limits of the SIMR extend from south of Sheridan Street to north of Griffin Road (covering the 3 northern interchanges of the PD&E Study). The purpose of this report is to document the procedures used in the development of directional design hour volumes (DDHVs) and the intersection turning movement volumes (TMVs) for 2050 conditions. *A detailed travel demand forecasting methodology was developed, approved, and documented in the Florida Department* of Transportation, Interchange Access Request, Methodology Letter of Understanding (MLOU) (see ***Appendix A***).

1.1 Project Location

A location map for the project is shown in Figure 1.1. The PD&E Study limits extend from Miami-Dade County Line to north of Griffin Road, Broward County Florida. The limits of the PD&E Study are within the City of Hollywood, City of Dania Beach, Town of Pembroke Park, and City of Hallandale Beach. Six interchanges are within the limits of the PD&E Study - Hallandale Beach Boulevard, Pembroke Road, Hollywood Boulevard, Sheridan Street, Stirling Road and Griffin Road. The three northern interchanges (Sheridan Street, Stirling Road and Griffin Road) are within the limits of the SIMR which is the subject of this project.

1.2 Area of Influence

The area of influence for the SIMR extends along I-95 from south of Sheridan Street to north of Griffin Road. The limits along I-95 include the ramps serving Hollywood Boulevard to and from the north and the ramps serving I-595 to and from the south. The area of influence includes three I-95 interchanges: Sheridan Street, Stirling Road and Griffin Road. The area of influence extends along each cross-street to include adjacent signalized intersections located within approximately 1/2 mile of the interchange. The signalized intersections within these limits are:

- Sheridan Street at N 29th Avenue
- Sheridan Street at N 28th Avenue
- Sheridan Street at SB I-95 Off-Ramp
- Sheridan Street at NB I-95 Of-Ramp
- Sheridan Street at N 26th Avenue
- Stirling Road at Anglers Avenue
- Stirling Road at NW 29th Avenue
- Stirling Road at SB I-95 Off-Ramp
- Stirling Road at NB I-95 Off-Ramp
- Stirling Road at SW 18th Avenue/Oakwood Boulevard
- Stirling Road at South Compass Way
- Stirling Road at Bryan Road
- Griffin Road at Anglers Avenue
- Griffin Road at SB I-95 Off-Ramp
- Griffin Road at NB I-95 Off Ramp
- Griffin Road at Old Griffin Road

The traffic forecast presented here-in covers the road segments and intersection described in the above area of influence.

Figure 1.1 – Project Location Map

2.0 Analysis Years

A. *Travel Demand Model*
- Base year: 2015
- Horizon year: 2045

B. *Traffic Operational Analysis*
- Existing year: 2021
- Opening year: 2030
- Interim year: 2040
- Design year: 2050

3.0 Project Traffic Forecast Development Methodology

*Travel demand forecast prepared by the FDOT for this project is documented in the Traffic Data Collection and Traffic Projections report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, May 20, 2022. (See **Appendix B**) This report contains traffic forecasts for the existing year - 2021 (AM, PM, AADT) and AADT forecast for future years (2030, 2045, 2050) No Build conditions. The information contained in this report was utilized in developing the forecasts for the Build Alternatives.*

A. Selected Travel Demand Model

The Southeast Florida Regional Planning Model (SERPM), Version 8.531 was used for the travel demand forecasting for this project. SERPM 8.531 is an Activity-Based Model (ABM) that simulates both household level and person-level travel choices including intra-household interactions with household members. SERPM 8.531 model is validated to year 2015 conditions and includes a future year 2045 scenario based on the adopted Cost Feasible Plans from the Miami-Dade, Broward, and Palm Beach MPOs. It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies. The RTTAC-MS comprises representatives from FDOT District 4, District 6, and the three MPOs in South Florida.

B. Project Traffic Forecast Development Methodology

The AADT volumes were developed based on existing traffic counts and growth factors. The growth factors were determined from 2015 and 2045 model volumes, historical traffic counts, and socioeconomic growth in the study area. The AADT volume, applicable K

factors and D factors, together with existing turning movement counts were used as input into the TMTOOL application to calculate future year turning movement volumes for No Build.

c. Validation Methodology

The SERPM 8.531 model was previously validated to year 2015 conditions following the standard model validation procedures, principles, and best practices in the industry. No further model validation task is required for this SIMR.

D. Adjustment Procedures

AADT projections were prepared by FDOT for the future years (2030, 2045 and 2050) under the No-Build conditions (see ***Appendix C****). Based on the coordination with the FDOT, the No Build conditions are defined as the transportation network with the inclusion of Cost Feasible Plan improvements in the adopted MPO 2045 Long Range Transportation Plan (LRTP). In addition, the preferred alternative from the I-95 PD&E study from Hallandale Beach Boulevard to Hollywood Boulevard is included as part of the No-Build conditions. The travel demand forecasts performed by FDOT included the following activities:*

- ***Data Gathering for Project Traffic from Past Studies****: The traffic projections and forecasts were gathered for the following 3 adjacent projects:*
    1. *I-95 PD&E Study from Hallandale Beach Boulevard to Hollywood Boulevard PD&E*
    2. *I-95 Corridor Planning Study led by FDOT District 4, and*
    3. *I-95 PD&E study from Miami Garden Drive to Miami/Broward County Line led by District 6*

  Coordination was carried out with the I-95 Express team and the teams for the above referenced I-95 PD&E Studies. This coordination was essential to ensure that traffic projections and improvements from various sources are all considered.

- ***Subarea Model Forecast for No-Build Conditions:*** *The socioeconomic data, network coding, and other model settings were reviewed to make sure they were consistent with the base year (2021) conditions. A future year (2045) No-Build Network in Southeast Florida Regional Planning Model (SERPM) was developed based on the 2045 Cost Feasible Plans adopted by the three MPOs in the region. The No-Build network also included the proposed improvements from the aforementioned projects and was coordinated with FDOT.*

- ***Future Traffic Projections:*** *Trends analysis was conducted using the historical traffic counts (see* ***Appendix D****). The growth factors were calculated using the population and employment data obtained from the SERPM model. A set of recommended growth rates were proposed based on the trends analysis, socioeconomic data, and model volumes for all links within the study network. The growth rates were applied to the existing year (2021) AADT volumes to obtain projections for the future years 2030, 2045 and 2050. Coordination was carried out to ensure the AADT projections at the county line along I-95 were consistent with the AADT forecast prepared by the I-95 PD&E Team south of the Miami-Dade County line. Traffic volumes for the interim years (2030, & 2040) were developed by interpolating data from the FDOT's traffic projections.*

4.0 TRAFFIC FACTORS

Recommended traffic factors were developed for the study network based on the following considerations:

- *The 2022 Florida Traffic Online (FTO) data was used to compute estimated K factors (per peak/daily ratios from the synopsis reports) and D factors in the year 2022. The computed 2022 K factors are relatively low (6.7 to 7.5) along I-95 and several of the cross-street approaches. This condition is typical for the highly urbanized nature of the study area with peak spreading conditions that extend for several hours during the AM and PM peak periods.*

- *Traffic factors previously approved for adjacent projects were reviewed for consistency along I-95 mainline. K factors ranging from 6.2% to 6.8% were previously approved for the adjacent PD&E Study along the segment of I-95 from Hallandale Beach Boulevard to Hollywood Boulevard.*

- *FDOT provided new recommendations for K factors per an e-mail that was distributed to the districts on July 27, 2023. The new guidelines allow for K factors ranging from 7.0% to 9.0% in highly urbanized areas. K factors in the lower range are applicable for roadways with extensive peak spreading characteristics, similar to the road network in the SIMR study area.*

- *The FDOT's 2019 Project Traffic Forecasting Handbook recommended D factors for urban freeways (50.4% to 61.2%) and urban arterials (50.8% to 67.1%) were reviewed for consistency.*

- *The 2022 FTO data was researched to gather classification counts within the project vicinity for each corridor (I-95, Griffin Road, Stirling Road and Sheridan Street). Truck factors (T Factor) were established based on the classification counts data. Design Hour Truck (DHT) factors were estimated at ½ T-factor and rounded to nearest whole number.*

- *Peak hour factors for existing year (2021) were computed based on existing year counts. A peak hour factor of 95% were assumed for future years (2030, 2040 and 2050) - consistent with guidelines for urban freeways and arterials, per FDOT's Traffic Analysis Handbook.*

  Based on the above considerations, recommended K factors and D factors were established for the project, as presented in the table below.

Table 4.1 – I-95 Recommended K & D Factors

I-95 Corridor (General Purpose & Express Lanes)								
From	To	Recommended K Factor		Recommended D Factor		T Factor	DHT	PHF
		AM	PM	AM	PM			
Hollywood Boulevard	Sheridan Street	7.00%	7.00%	51.60%	52.30%	5.0%	3.0%	Varies
Sheridan Street	Stirling Road	7.00%	7.00%	52.30%	50.80%	5.0%	3.0%	Varies
Stirling Road	Griffin Road	7.00%	7.00%	52.30%	50.80%	5.0%	3.0%	Varies
Griffin Road	I-595	7.00%	7.00%	52.30%	50.80%	5.0%	3.0%	Varies

After researching several prior PD&E studies and comparing procedures, FDOT D4 agreed that it was acceptable to compute the interim year volumes using the interpolation procedure.

Table 4.2 – Arterial Roadways Recommended K & D Factors

Arterial Corridors								
Roadway	Location	Recommended K Factor		Recommended D Factor		T Factor	DHT	PHF
		AM	PM	AM	PM			
Sheridan Street	West of I-95	7.30%	7.30%	55.80%	54.40%	3.5%	2.0%	Varies
	East of I-95	7.30%	7.30%	52.10%	50.08%	3.5%	2.0%	Varies
Stirling Road	West of I-95	8.00%	8.00%	54.40%	54.30%	4.0%	2.0%	Varies
	East of I-95	7.50%	7.50%	56.60%	53.40%	4.0%	2.0%	Varies
Griffin Road	West of I-95	7.50%	7.50%	55.20%	51.50%	6.5%	3.0%	Varies
	East of I-95	9.00%	9.00%	59.90%	57.10%	6.5%	3.0%	Varies

5.0 Post-Processing Approach and DDHVs and Turning Movement Volumes Development

Turning Movement Volumes Development using TMTOOL:

The TMTOOL Spreadsheets were populated with the approved AADTs from 2021 and the recommended annual growth rates for estimating the 2030, 2040 and 2050 AADTs. The spreadsheets were also populated with the 2021 turning movement volumes for AM and PM peak hours, and with the recommended K and D factors. The TMTOOL model runs, and the results were carefully reviewed for any anomalies. For ramp terminal intersections, the through volumes are prohibited. However, in order to make TMTOOL work, a small number (volume ~1) was assumed. In addition, the D factor for ramp volumes approaching the terminal intersections was assumed to be 99%, as these are one-way links. The TMTOOL input and output reports are contained under **Appendix E.**

The TMTOOL results were post-processed using the *FDOT 2019 Project Traffic Forecasting Handbook* and *NCHRP 765* recommendations. The project team developed a corridor prototype spreadsheet for peak-hour turning movement volumes. If negative or low growths were observed at any location, then a minimum growth rate of 0.5% was applied. The volumes were balanced and smoothed as needed.

Adjacent intersections east and west of the I-95 corridor are included as part of the study area. The following steps were performed in the balancing effort:

- Reviewed the aerial images of the intersections for the presence of driveways and minor streets.
- The forecasted turning movement volumes with negative growth were manually adjusted using a growth rate of 0.5%.
- The ramp terminal intersection volumes were locked to balance the mainline I-95 DDHVs.
- The mainline I-95 DDHVs were developed using the control totals at the south of end of study area (south of Sheridan Street).
- The ramp DDHV volumes were developed using the TMTOOL outputs and they were used as additional control totals.
- The mainline DDHV volumes for all other segments were estimated by balancing the volumes across the corridor, by adding/subtracting the ramp DDHVs.
- The final volumes were reported and not rounded for precision in operational analysis.

6.0 2050 No Build Traffic Forecast

The forecasted 2050 No Build peak hour volumes resulting from the above procedures are depicted in Figure 6.1.

7.0 2030 No Build Traffic Forecast

Traffic forecast for the No Build opening year 2030 was developed by linear interpolation using the 2021 (existing year) turning movement volumes and the 2050 (design year) turning movement volume forecast. The forecasted 2030 No Build peak hour volumes resulting from this interpolation process are depicted in Figure 6.2.

1.0 Project Description

Provide background or supporting information that explains the basis for the request.

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study along the segment SR 9/I-95 extending from the Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). The PD&E Study limits extend along SR 9/I-95 for approximately 6.5 miles in Broward County, Florida. The project proposes to address deficiencies and improve safety and traffic operations at the existing interchanges and cross streets and enhance the express lanes along SR 9/I-95 from the Miami-Dade/Broward County Line to north of Griffin Road. Modifications are proposed at the three northern interchanges within the PD&E Study Limits - SR 818/Griffin Road, SR 848/Stirling Road, and SR 822/Sheridan Street. FDOT is preparing a Systems Interchange Modification Report (SIMR) to support the proposed modifications to these three interchanges. The limits of the SIMR extend from south of Sheridan Street to north of Griffin Road (covering the 3 northern interchanges of the PD&E Study). This document serves as the Methodology Letter of Understanding (MLOU) that outlines the criteria, assumptions, processes (analyses), and documentation requirements for preparation of the SIMR. The SIMR will serve as the Project Traffic Analysis Report (PTAR) for the related National Environmental Policy Act (NEPA) study encompassing the three interchanges and associated arterial improvements.

This SIMR is being prepared in coordination with the adjacent FDOT PD&E Study (FM No.436903-1-22-02) which is implementing modifications to the I-95 interchanges at Hollywood Boulevard, Pembroke Road and Hallandale Beach Boulevard. FDOT is preparing a separate SIMR to support the interchange modifications associated with this adjacent PD&E Study. Also notable is the 95 Express Phase 3C project which is currently under construction. This project is implementing express lanes along I-95 with direct connect ramps to and from I-595.

Modifications to the I-95 express lanes system may be considered under the I-95 PD&E Study extending from Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). These potential express lanes modifications may be prepared through the available optional services that are included in the project scope of services. If the optional services are advanced and modifications to the I-95 express lanes system are proposed, a separate Corridor Traffic Analysis Report (CTAR) will be prepared which will encompass all proposed improvements to the interchanges (6 total) and the I-95 mainline segment extending from Miami-Dade/Broward County Line to north of Griffin Road.

A. Purpose and Need Statement

Provide the Purpose, the Need, and the Goals and Objectives.

Traffic Demand (primary)

The year 2021 Annual Average Daily Traffic (AADT) along the SR-9/I-95 project limits ranged between 198,500 vehicles and 256,000 vehicles. This is slightly lower than pre-COVID conditions which had a 2019 AADT between 213,000 vehicles and 267,000 vehicles. Based on the traffic projections prepared for the project, the traffic demand is projected to continue increasing at a rate of 0.5% per year. The projected 2050 AADT was estimated to be between 248,000 vehicles and 333,400 vehicles. The proposed improvements include addressing existing and future traffic demand.

Operational Deficiencies (primary)

The SR 9/I-95 project interchanges, ramp terminals, and cross streets within the project limits are over-saturated. Traffic analysis was conducted for each interchange as part of the FDOT District 4 Interchange Concept Development Report from 2016. According to the study, the following locations are operating at Level of Service (LOS) E or worse during existing conditions (year 2012/2013):

- SR 848/Stirling Road: I-95 northbound ramp terminal intersection
- SR 822/Sheridan Street: I-95 Northbound ramp terminal intersection

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

The future analysis, which projected traffic demand to the year 2040, describes the following locations that are expected to operate at LOS E or worse:

- SR 818/Griffin Road: All I-95 ramp terminal intersections
- SR 848/Stirling Road: I-95 Northbound ramp terminal intersection
- SR 822/Sheridan Street: All I-95 ramp terminal intersections
- I-95 southbound freeway segments within the project limits: Eight segments
- I-95 northbound freeway segments within the project limits: Four segments

Safety (primary)

A historical crash evaluation of the SR 9/I-95 project limits revealed a total of 4,764 crashes observed over a five-year period between 2016 and 2020. Approximately 0.5% of these crashes were fatal and 38.5% were coded with injuries. This is higher than the Districtwide statistics for the period from 2015 to 2019 which shows approximately 0.4% fatal crashes and 28.9% involving injuries. The predominant crash types along the project corridor consisted of rear ends at 52.4%, followed by sideswipes at 20.8% and crashes coded as other at 20.8%. The lane departure crash types such as those involving barriers comprised 11.5% of the crashes. The rear end crash types are higher than the Districtwide statistic of 33.4%. Higher rear end crash types may be correlated to congestion.

The Broward MPOs 2045 LRTP depicts the SR 9/I-95 project limits as a top corridor for future safety studies due to its high severity index per mile of over 200. The results are similar for the interchange cross streets at SR 822/Sheridan Street, SR 848/Stirling Road, and SR 818/Griffin Road. The severity index is a measure that looks at total crashes and crash severity and uses a weighted average (higher score for incapacitating and fatal crashes) to develop an index that ranks locations in terms of their importance for future safety analysis and improvements. The 2021 Florida Strategic Highway Safety Plan (FSHSP) has identified lane departure crashes as an emphasis area which is a high crash type along the project corridor. Pedestrians, bicyclists and intersections are another emphasis area which applies to the interchange areas. The proposed improvements include operational improvements at the interchanges which are expected to alleviate crash patterns that are correlated to congestion. Improvements at the cross streets are anticipated to enhance bicycle and pedestrian accommodations which may also alleviate crash patterns related to those modes.

SR 9/I-95 and the project interchanges are designated evacuation routes according to the Florida Division of Emergency Management and Broward County. The proposed project improvements will address operational deficiencies which will help to improve travel time during evacuation events and emergency situations.

Social Demands and Economic Development (secondary)

SR 9/I-95, which is part of the Florida Strategic Intermodal System (SIS), supports the regional social and economic development activity in South Florida. The facility connects the major employment and population centers in Broward County, Miami-Dade County, and Palm Beach County. According to the Broward MPO 2045 LRTP, the County's population is projected to grow 27% between the years 2015 and 2045. Similarly, employment is projected to increase 25% in that same time period. Urban infill and redevelopment are common in the region and in the vicinity of the project limits. The proposed improvements will enhance connectivity to nearby employment areas, schools, and recreational facilities.

Modal Interrelationships (secondary)

SR 9/I-95 is part of the SIS which is a high priority network of transportation facilities important to the state's economy and mobility. The corridor is a primary highway in the National Highway Freight Network. The truck factor varies but is approximately 9% within the SR-9/I-95 project limits. The limited access corridor also services several premium express transit routes for Broward County Transit and Miami-Dade County Department of Transportation and Public Works Metrobus system. All of the project interchange areas include sidewalks on both sides of the arterials passing underneath the SR 9/I- 95 bridges. Generally, there is a lack of dedicated bicycle facilities. The Broward MPO Complete Streets Master Plan (dated 2019) confirms the gaps in the existing

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

bicycle network along the project interchange cross streets. This master plan proposes a bicycle facility project along SR 818/Griffin Road and complete streets projects along SR 848/Stirling Road and SR 822/Sheridan Street.

The proposed improvements will address operational deficiencies at the interchanges and improve access to the managed lanes system which is expected to improve traffic flow along the SR 9/I-95 corridor benefiting all users including freight and premium express bus transit. Improvements at the interchange ramp terminals and arterial cross streets are expected to benefit multiple modes such as vehicles, freight, transit, bicyclists and pedestrians.

B. Project Location

Provide project description and a map of the IAR project location.

A location map for the project is shown in Figure 1. The PD&E Study limits extend from Miami-Dade County Line to north of Griffin Road, Broward County Florida. The limits of the PD&E Study are within the City of Hollywood, City of Dania Beach, Town of Pembroke Park, and City of Hallandale Beach. Six interchanges are within the limits of the PD&E Study - Hallandale Beach Boulevard, Pembroke Road, Hollywood Boulevard, Sheridan Street, Stirling Road and Griffin Road. The three northern interchanges (Sheridan Street, Stirling Road and Griffin Road) are within the limits of the SIMR which is the subject of this MLOU.

C. Area of Influence

Provide a description of the area of influence along the main line and cross street.

The area of influence for the SIMR is depicted in Figure 2. It extends along I-95 from south of Sheridan Street to north of Griffin Road. The limits along I-95 include the ramps serving Hollywood Boulevard to and from the north and the ramps serving I-595 to and from the south. The ramp connections to I-595, within the area of influence, are not expected to have any impact on the I-595/I-95 Interchange. The area of influence includes three I-95 interchanges: Sheridan Street, Stirling Road and Griffin Road. All freeway segments (merge, diverge, basic and weaving segments) within the area of influence will be analyzed. The area of influence extends along each cross-street to include adjacent signalized intersections located within approximately 1/2 mile of the interchange. The signalized intersections within these limits are:

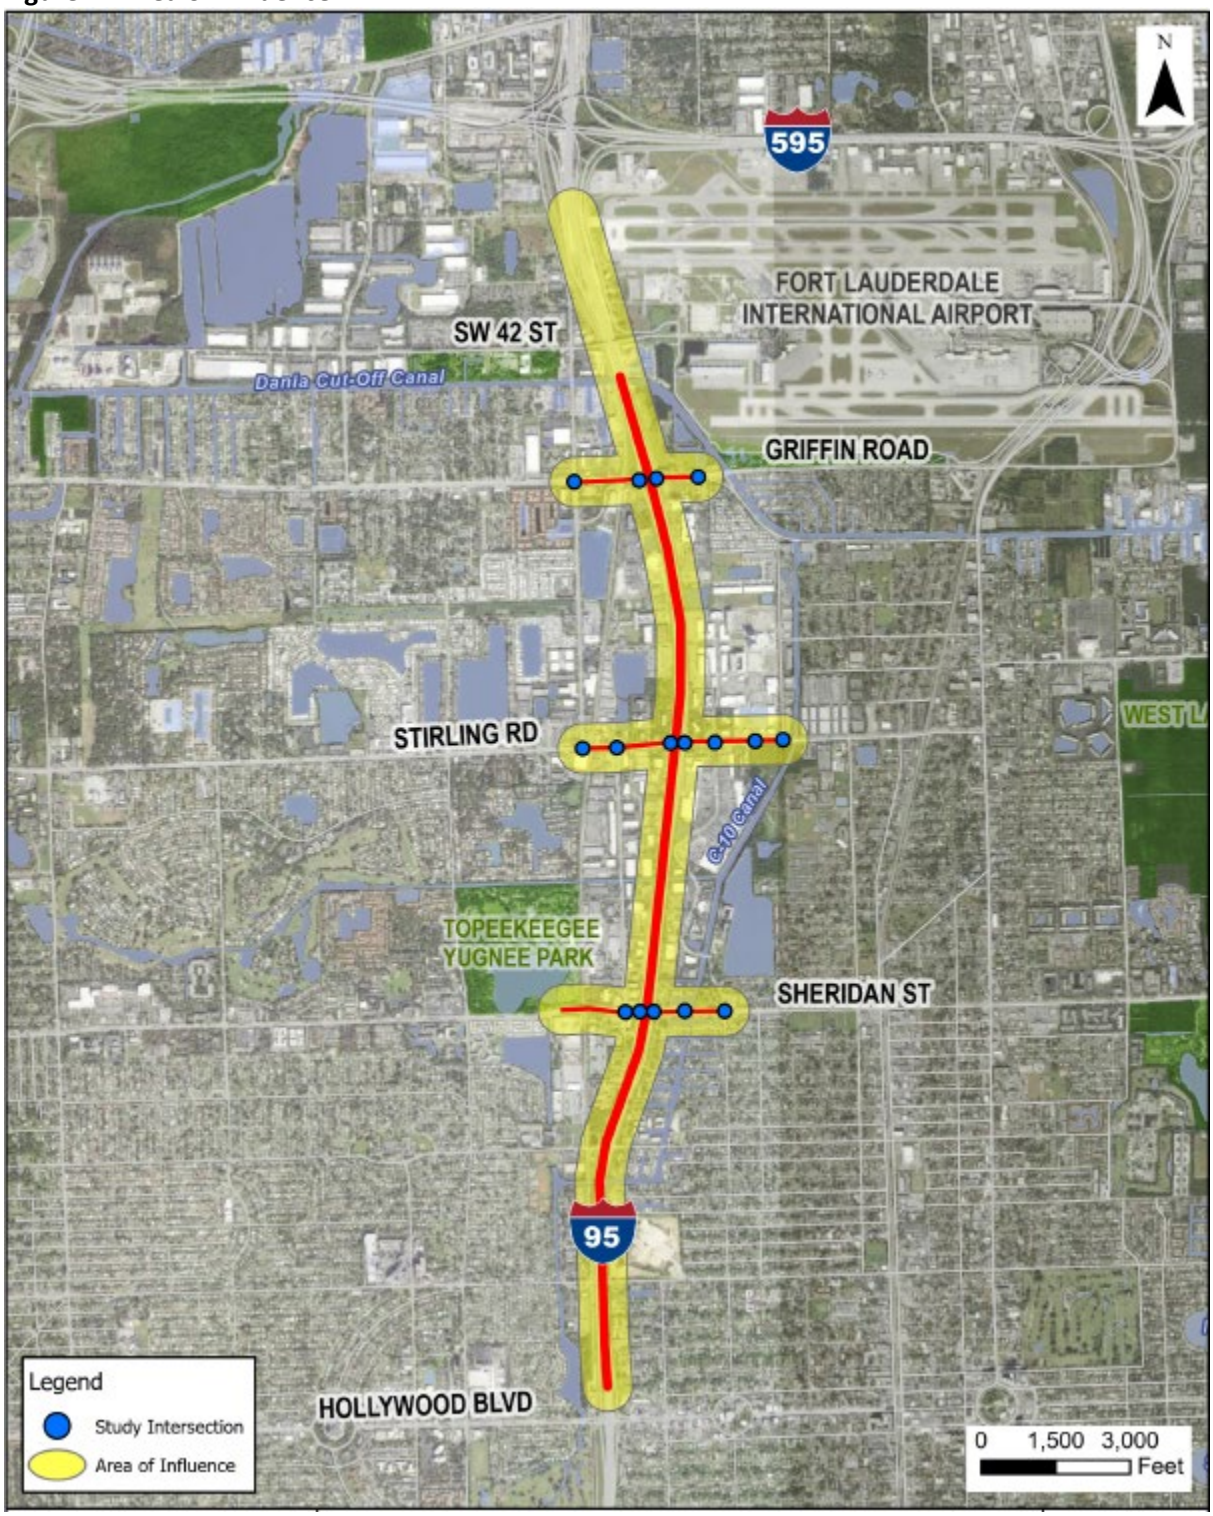
- Sheridan Street at N 29th Avenue
- Sheridan Street at N 28th Avenue
- Sheridan Street at SB I-95 Off-Ramp
- Sheridan Street at NB I-95 Of-Ramp
- Sheridan Street at N 26th Avenue
- Stirling Road at Anglers Avenue
- Stirling Road at NW 29th Avenue
- Stirling Road at SB I-95 Off-Ramp
- Stirling Road at NB I-95 Off-Ramp
- Stirling Road at SW 18th Avenue/Oakwood Boulevard
- Stirling Road at South Compass Way
- Stirling Road at Bryan Road
- Griffin Road at Anglers Avenue
- Griffin Road at SB I-95 Off-Ramp
- Griffin Road at NB I-95 Off Ramp
- Griffin Road at Old Griffin Road

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

Figure 1: Project Location Map

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

Figure 2: Area of Influence



DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

D. Project Schedule

Identify the schedule of production activities consistent with a proposed conceptual funding plan and opening year.

Funding in the amount of $6,016,042 was programmed for the PD&E Study under Fiscal Year (FY) 2023 in the FY 2018 - 2023 FDOT Work Program (FM #439170-1). The project is funded for Preliminary Engineering (Final Design) with an allocation of $50,020,000 under FY 2026 in the FDOT Work Program FY 2024 – 2028. Location Design Concept Acceptance (LDCA) for the PD&E Study is expected circa January 2026. The anticipated opening year for the project is 2030, subject to construction funding.

2.0 Analysis Years

A. Travel Demand Model

- Base year: 2015
- Horizon year: 2045

B. Traffic Operational Analysis

- Existing year: 2021 (consistent with FDOT's pre-work activities)
- Opening year: 2030
- Interim year: 2040
- Design year: 2050

A year of failure analysis shall be performed for Preferred Alternative, in case a failing LOS is obtained in Design Year.

3.0 Alternatives

The No-Build and Build alternatives shall be analyzed in the IAR. Details of all reasonable build alternatives considered, including those eliminated from further considerations, shall be documented. The documentation for the alternatives eliminated can be minimal like a summary of what was considered, reasons for elimination etc. Build Alternatives meeting purpose and need of the project shall have a more detailed description and evaluated in the IAR. The implementation of TSM&O elements will be incorporated in the IAR Recommended Alternative.

4.0 Data Collection

The type of data that may be used should be identified.

A. Transportation System Data

Transportation system data will be gathered from various sources, including the following*:*

- *Field review conducted along the project corridors.*
- *Review of aerial photographs*
- *Broward County Public Works Department*
- *FDOT Roadway Characteristic Inventory Database*
- *FDOT Traffic Information Online*
- *Signal4Analytics*
- *Prior and other on-going studies conducted within the project area, most notably:*
    - *I-95 PD&E Study from Miami-Dade County Line to Hollywood Boulevard*
    - *I-95 Express Phase 3*
    - *I-95 PD&E Study from Golden Glades Interchange to Miami-Dade/Broward County Line.*

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

B. Existing and Historical Traffic Data

Existing and historical traffic will be gathered from various sources including the following:

- *Traffic Data Collection and Traffic Projections report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, May 20, 2022. The is the pre-work traffic information prepared by FDOT for the PD&E Study. This document will serve as the primary traffic data source for the project.*
- *FDOT Traffic Information Online*
- *RITIS and other available BIG Data sources*
- *Broward County*
- *Active DRIs and other major developments*
- *Traffic Reports for adjacent projects*
    - *I-95 PD&E Study from Miami-Dade County Line to Hollywood Boulevard*
    - *I-95 Express Phase 3*
    - *I-95 PD&E Study from Golden Glades Interchange to Miami-Dade/Broward County Line.*

C. Land Use Data

Existing and Future land use data will be gathered from various sources, such as, Florida Geographic Data Library (FGDL), Broward County MPO 2045 Metropolitan Transportation Plan (MTP), local government comprehensive plans and any active development of regional impact (DRI) applications or other major developments within the project vicinity.

D. Environmental Data

Environmental data will be gathered from the FGDL and through coordination with local, state, and national agencies, these include:

- Broward County
- Florida Department of Environmental Protection
- South Florida Water Management District
- US Army Corps of Engineers
- US Fish and Wildlife Service
- Florida Fish and Wildlife Commission
- US Environmental Protection Agency

E. Planned and Programmed Projects

Planned and programmed projects will be identified in consultation with the FDOT, Broward County, other stakeholders and reviewing the following documents:

- Broward County MPO 2045 Metropolitan Transportation Plan (MTP)
- Miami-Dade County MPO TIP and Priority Projects
- Local government comprehensive plans
- Active DRI applications and other major developments
- FDOT's Five Year Work Program
- FDOT's Strategic Intermodal System plans
- *I*-95 PD&E Study from Miami-Dade County Line to Hollywood Boulevard (on-going project)
- I-95 Express Phase 3 (on-going Design-Build project)
- I-95 PD&E Study from Golden Glades Interchange to Miami-Dade/Broward County Line (on-going project)

The SIMR will be prepared in coordination with all planned and programed projects for consistency.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

5.0 Travel Demand Forecasting

Travel demand forecast prepared by the FDOT for this project is documented in the Traffic Data Collection and Traffic Projections report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road, FDOT, May 20, 2022. This report contains traffic forecasts for the existing year - 2021 (AM, PM, AADT) and AADT forecast for future years (2030, 2045, 2050) No Build conditions. The information contained in this report will be utilized in developing the forecasts for the Build Alternatives.

A. *Selected Travel Demand Model(s)*

The Southeast Florida Regional Planning Model (SERPM), Version 8.531 was used for the travel demand forecasting for this project. SERPM 8.531 is an Activity-Based Model (ABM) that simulates both household level and person-level travel choices including intra-household interactions with household members. SERPM 8.531 model is validated to year 2015 conditions and includes a future year 2045 scenario based on the adopted Cost Feasible plans from the Miami-Dade, Broward, and Palm Beach MPOs. It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies. The RTTAC-MS comprises representatives from FDOT District 4, District 6, and the three MPOs in South Florida.

B. *Project Traffic Forecast Development Methodology*

Describe the methodology and assumptions in developing the future year traffic volumes (AADT and DDHV)

The AADT volumes were developed based on existing traffic counts and growth factors. The growth factors were determined from 2015 and 2045 model volumes, historical traffic counts, and socioeconomic growth in the study area. The AADT volume, applicable K factors and D factors, together with existing turning movement counts will be used as input into the TmTool application to calculate future year turning movement volumes for No Build and Build conditions.

C. *Validation Methodology*

Describe the validation methodology using current FDOT procedures and data collection procedure.
Identify how modifications to the travel demand forecasting model will be made, including modifications to the facility type and area type for links, modifications to socio-economic data and all input and output modeling files for review.

The SERPM 8.531 model was previously validated to year 2015 conditions following the standard model validation procedures, principles, and best practices in the industry. No further model validation task is required for this SIMR.

D. *Adjustment Procedures*

Identify the process used to adjust modeled future year traffic to the defined analysis years. Discuss how trends/growth-rates will be factored into this, if applicable.

AADT projections were prepared by FDOT for the future years (2030, 2045 and 2050) under the No-Build conditions. Based on the coordination with the FDOT, the No Build conditions are defined as the transportation network with the inclusion of Cost Feasible Plan improvements in the adopted MPO 2045 Long Range Transportation Plan (LRTP). In addition, the preferred alternative from the I-95 PD&E study from Hallandale Beach Boulevard to Hollywood Boulevard is included as part of the No-Build conditions. The travel demand forecasts performed by FDOT included the following activities:

• **Data Gathering for Project Traffic from Past Studies:** The traffic projections and forecasts were gathered for the following 3 adjacent projects:

1. I-95 PD&E Study from Hallandale Beach Boulevard to Hollywood Boulevard PD&E
2. I-95 Corridor Planning Study led by FDOT District 4, and
3. I-95 PD&E study from Miami Garden Drive to Miami/Broward County Line led by District 6.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

Coordination was carried out with the I-95 Express Team and the Teams for the above referenced I-95 PD&E Studies. This coordination was essential to ensure that traffic projections and improvements from various sources are all considered.

• **Subarea Model Forecast for No-Build Conditions:** The socioeconomic data, network coding, and other model settings were reviewed to make sure they were consistent with the base year (2021) conditions. A future year (2045) No-Build Network in Southeast Florida Regional Planning Model (SERPM) was developed based on the 2045 Cost Feasible Plans adopted by the three MPOs in the region. The No-Build network also included the proposed improvements from the aforementioned projects and was coordinated with FDOT.

• **Future Traffic Projections**: Trends analysis was conducted using the historical traffic counts. The growth factors were calculated using the population and employment data obtained from the SERPM model. A set of recommended growth rates were proposed based on the trends analysis, socioeconomic data, and model volumes for all links within the study network. The growth rates were applied to the existing year (2021) AADT volumes to obtain projections for the future years 2030, 2045 and 2050. Coordination was carried out to ensure the AADT projections at the county line along I-95 were consistent with the AADT forecast prepared by the I-95 PD&E Team south of the Miami-Dade County line. Traffic volumes for the interim year (2040) will be developed by interpolating data from the FDOT's traffic projections.

E. *Traffic Factors*

Recommended traffic factors were developed for the study network based on the following considerations:

- The 2022 Florida Traffic Online (FTO) data was used to compute estimated K factors (per peak/daily ratios from the synopsis reports) and D factors in the year 2022. The computed 2022 K factors are relatively low (6.7 to 7.5) along I-95 and several of the cross-street approaches. This condition is typical for the highly urbanized nature of the study area with peak spreading conditions that extend for several hours during the AM and PM peak periods.
- Traffic factors previously approved for adjacent projects were reviewed for consistency along I-95 mainline. K factors ranging from 6.2% to 6.8% were previously approved for the adjacent PD&E Study along the segment of I-95 from Hallandale Beach Boulevard to Hollywood Boulevard.
- FDOT provided new recommendations for K factors per e-mail distributed to the districts on July 27, 2023. The new guidelines allow for K factors ranging from 7.0% to 9.0% in highly urbanized areas. K factors in the lower range are applicable for roadways with extensive peak spreading characteristics, similar to the road network in the SIMR study area.
- The FDOT's 2019 Project Traffic Forecasting Handbook recommended D factors for urban freeways (50.4% to 61.2%) and urban arterials (50.8% to 67.1%) were reviewed for consistency.
- The 2022 FTO data was researched to gather classification counts within the project vicinity for each corridor (I-95, Griffin Road, Stirling Road and Sheridan Street). Truck factors (T Factor) were established based on the classification counts data. Design Hour Truck (DHT) factors were estimated at ½ T-factor and rounded to nearest whole number.
- Peak hour factors for existing year (2021) will be computed based on existing year counts. A peak hour factor of 95% will be assumed for future years (2030, 2040 and 2050) - consistent with guidelines for urban freeways and arterials, per FDOT's Traffic Analysis Handbook.

Based on the above considerations, recommended K factors and D factors were established for the project, as presented in the table below.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

I-95 Corridor								
From	**To**	**K Factor**		**D Factor**		**T Factor**	**DHT**	**PHF**
		AM	**PM**	**AM**	**PM**			
Hollywood Boulevard	Sheridan Street	7.0%	7.0%	51.6%	52.3%	5.0%	3.0%	varies
Sheridan Street	Stirling Road	7.0%	7.0%	52.3%	50.8%	5.0%	3.0%	varies
Stirling Road	Griffin Road	7.0%	7.0%	52.3%	50.8%	5.0%	3.0%	varies
Griffin Road	I-595	7.0%	7.0%	52.3%	50.8%	5.0%	3.0%	varies
Arterial Corridors								
Roadway	**Location**	**K Factor**		**D Factor**		**T Factor**	**DHT**	**PHF**
		AM	**PM**	**AM**	**PM**			
Sheridan Street	West of I-95	7.3%	7.3%	55.8%	54.4%	3.5%	2.0%	Varies
	East of I-95	7.3%	7.3%	52.1%	50.0%	3.5%	2.0%	Varies
Stirling Road	West of I-95	8.0%	8.0%	54.4%	54.3%	4.0%	2.0%	Varies
	East of I-95	7.5%	7.5%	56.6%	53.4%	4.0%	2.0%	Varies
Griffin Road	West of I-95	7.5%	7.5%	55.2%	51.5%	6.5%	3.0%	Varies
	East of I-95	9.0%	9.0%	59.9%	57.1%	6.5%	3.0%	varies

If any of the above traffic factors are modified during the IAR due to additional information becoming available, then CO will be informed and supporting information will be provided in the IAR.

6.0 Traffic Operational Analysis

The area type, traffic conditions, and analysis tools to be used are summarized in this section.

A. Existing Area Type/Traffic Conditions

Area Type	Conditions	
	Under Saturated	Saturated
Rural	☐	☐
Urban Area/Transitioning Area	☐	☒

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

B. Traffic Analysis Software Used

Vissim will be the primary tool used for comparing traffic operations for the No Build and the Recommended Alternative resulting from the PD&E Study. HCS and Synchro will be used for preliminary screening of Build Alternatives and to supplement the simulation output.

Software		System Component					
		Freeway				Crossroad	
Name	Version	Basic Segment	Weaving	Ramp Merge	Ramp Diverge	Arterials	Intersections
HCS/HCM	2023	☒	☒	☒	☒	☐	☐
Synchro	12	☐	☐	☐	☐	☒	☒
Corsim	☐	☐	☐	☐	☐	☐	☐
Vissim	2022	☒	☒	☒	☒	☒	☒
Other	☐	☐	☐	☐	☐	☐	☐

C. Calibration Methodology

- *Calibration methodology and parameters utilized will be documented.*
- *Calibration Measures of Effectiveness (MOEs) and calibration targets.*

Synchro Models:

Synchro models will be developed and calibrated using the criteria adopted from the 2021 FDOT Traffic Analysis Handbook. Synchro model calibration will be conducted per Section 6.4.2 of the 2021 FDOT Traffic Analysis Handbook.

The calibration process will be supported by data gathered during field observations, such as: typical queue lengths, operating speeds, right turns on red, signal operations and pedestrian/bicycle activity.

Vissim Models:

The simulation calibration will incorporate guidance and criteria from the 2021 FDOT Traffic Analysis Handbook. Prior calibration factors used for the adjacent I-95 PD&E study and I-95 Express Lanes projects will also be reviewed. Traffic volume data, travel time data, and field observations will be used in the calibration of the Vissim model. Vissim models will be developed for the existing year (2021) for calibration and for the design year (2050) for comparison of the No Build and Preferred Build Alternative.

Vissim models will be developed covering a total of 4 ½ hours in the AM and PM peak periods using 15-minute flow rates. The simulation periods will include the following:

- AM Period: ½ hour seeding + 4-hour AM peak period
- PM Period: ½ hour seeding + 4-hour PM peak period

Several calibration measures will be used to ensure that the model replicates the field conditions. The calibration process will consist of measuring and comparing volume, speed/travel time, and visual audits. Volumes, travel times, and speeds for freeway mainline and arterial (surface street) facilities will be calibrated using criteria specified in the 2021 FDOT Traffic Analysis Handbook.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

The major bottlenecks within the study area will be calibrated to replicate the capacity and congestion based on field data. Visual audits of the simulation will be performed to analyst's satisfaction to observe speed-flow relationships for individual links and acceptable queuing at intersections and other bottlenecks in the network. In addition to average travel speeds, individual link speeds and speed-flow diagrams will be used to evaluate the performance of the network.

To determine the required number of simulation runs, statistical tests will be performed using a 95% confidence level and an allowable error of 10%. It is anticipated that 10 runs will be adequate based on prior experience within this corridor. Vissim default vehicle characteristics will be used in the model as a starting point. Any parameters that are changed from the default value will be documented and justified accordingly.

All future year Build and No-Build models will be created from the calibrated 2021 existing model.

D. Selection of Measures of Effectiveness (MOE)

- *The Level of Service criteria for each roadway classification, including mainline, ramps, ramp terminal intersections and the crossroad beyond the interchange ramp terminal intersections are identified below.*

  The project study area is located within the urbanized area of Broward County. Hence, a target LOS D will be used for all roadway facilities, per FDOT's Level of Service Policy.

- *In addition to the Level of Service criteria, state other operational MOEs to be utilized for the evaluation of alternatives.*

The following MOEs will be used to evaluate the performance of the considered alternatives:

- Synchro
  - Level of Service – Overall intersection LOS and by movement
  - Delay – Overall intersection control delay and by movement
  - 95th percentile queue lengths
- HCS
  - Basic Freeway Segments – Density and LOS
  - Freeway Merge, Diverge and Weaving Segments – Density and LOS

- Vissim (Design Year only)
  - Freeway: volume, speed, estimated density and estimated LOS
  - Intersections: volume, delay, and max queue length
  - Network-wide: total travel time, total delay time, average delay, latent delay, vehicle-miles of travel, average speed, latent demand, vehicles arrived and total stops.

The Vissim analysis will compare MOEs for the No Build and Preferred Alternative. Vissim MOEs will be assessed for a simulation period covering a total of 4 ½ hours in the AM period and 4 ½ hours in the PM period, as described under Section 6C.

7.0 Safety Analysis

A. Detailed crash data within the study area will be analyzed and documented. The latest five years of crash data shall be used.

Years: January 2018 through July 2023
Source: Signal4Analytics

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

B. Identify the level of safety analysis to be performed, along with any software and tools to be used.

The safety analysis will identify existing safety concerns as reflected in the crash data. The analysis will be conducted per guidelines contained in FDOT's 2022 Interchange Access Request User's Guide, Chapter 6 Safety Analysis Guidance. The safety analysis will incorporate a qualitative assessment as well as a quantitative assessment for the Preferred Alternative and No Build conditions. Historical crash records will be gathered and summarized to identify crash characteristics such as: crash types, severity, lighting conditions, surface conditions and weather conditions. The quantitative safety analysis will be performed per the Highway Safety Manual (HSM) and using the Interactive Highway Safety Design Model (IHSDM) or other analysis tool approved by FDOT for computations. Proposed improvements will incorporate crash countermeasures, to the extent feasible, within the scope of the project.

8.0 Consistency with Other Plans/Projects

A. The request will be reviewed for consistency with facility Master Plans, Actions Plans, SIS Plan, MPO Long Range Transportation Plans, Local Government Comprehensive Plans or development applications, etc.

The proposed improvement under consideration in the SIMR are consistent with the Broward County MPO Metropolitan Transportation Plan (MTP), Broward County Interchanges Master Plan, and FDOT's Strategic Intermodal System (SIS) Plan.

B. Where the request is inconsistent with any plan, steps to bring the plan into consistency will be developed.

The proposed improvements are consistent with all applicable plans.

C. The operational relationship of this request to the other interchanges will be reviewed and documented. The following other IARs are located within the area of influence.

- Systems Interchange Modification Report (SIMR) for I-95 from Hallandale Beach Boulevard to Hollywood Boulevard (on-going)
- I-595 SIMR Reevaluation, 2015, 2017 and 2019. These SIMR reevaluations include I-95/I-595 system-to-system interchange improvements and the 95 Express direct connect ramps which are currently under construction.

9.0 Environmental Considerations

A. Status of Environmental Approval and permitting process.

B. Identify the environmental considerations that could influence the outcome of the alternative development and selection process.

10.0 Coordination

Yes	No*	N/A*	
☒	☐	☐	An appropriate effort of coordination will be made with appropriate proposed developments in the area.
☒	☐	☐	Request will identify and include (if applicable) a commitment to complete the other non-interchange/non-intersection improvements that are necessary for the interchange/intersection to function as proposed.

DocuSign Envelope ID: D79CAAC2-708D-4944-AB38-F581ECA7F68C

☒	☐	☐	Request will document whether the project requires financial or infrastructure commitments from other agencies, organizations, or private entities.
☒	☐	☐	Request will document any pre-condition contingencies required in regards to the timing of other improvements and their inclusion in a TIP/STIP/LRTP prior to the Interstate access approval (final approval of NEPA document).
☒	☐	☐	Request will document the funding and phasing.

**Explain if No or Not Applicable (N/A) is checked*:

11.0 Anticipated Design Exceptions and Variations

Any known exceptions/variations to FDOT, AASHTO or FHWA rules, policies, standards, criteria or procedures will be listed in the IAR document.

Design exceptions/variations are not anticipated at this time. However, should the need arise, they will be documented in the SIMR.

12.0 Conceptual Signing Plan

A conceptual signing and marking plan shall be prepared and included in the access request.

The conceptual signing and marking plan will be prepared consistent with the Manual on Uniform Traffic Control Devices (MUTCD).

13.0 Access Management Plan

☐ *Access management plan within the area of influence will not be changed by the proposed improvements to the interchange.*

☒ *The improvement will affect the access management within the area of influence that will require a change to the access management plan. An access management plan will be developed within the area of influence to complement the improvements to the interchange.*

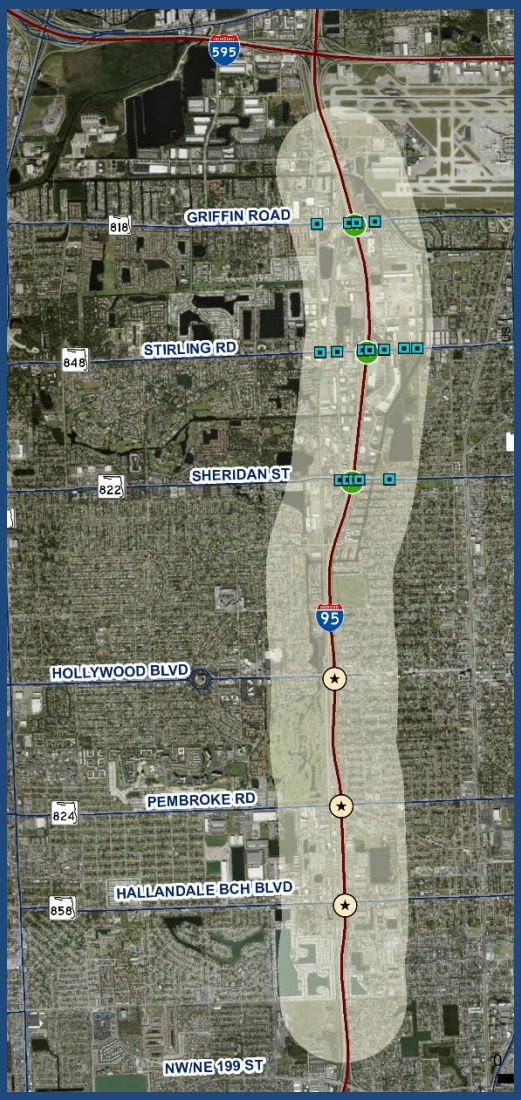
The interchange modifications may impact access to some properties within the area of influence. If access is impacted, an access management plan will be prepared to compliment the improvements, and this will be documented in the SIMR.

14.0 FHWA Policy Points

The two FHWA policy points will be addressed within the access request.

APPENDIX B

Traffic Data Collection and Traffic Projections Report for I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road



TRAFFIC DATA COLLECTION & TRAFFIC PROJECTIONS FOR

I-95 PD&E STUDY
FROM MIAMI-DADE / BROWARD COUNTY LINE TO NORTH OF GRIFFIN ROAD

FM No. 425980-5-22-01, 425980-4-32-01

Final Report

1. INTRODUCTION

Florida Department of Transportation (FDOT) is programmed to conduct a PD&E study for I-95 from Miami-Dade/Broward County Line to north of Griffin Road, including interchange improvements at Sheridan Street, Stirling Road, and Griffin Road (FM 439170-1-22-01). The PD&E study will evaluate the recommendations proposed by the Broward County I-95 Interchange Master Plan (IMP) and subsequent recommendations by the I-95 Corridor Planning Study for these limits. Within the study limits, FDOT District 4 is completing a PD&E study from SR-858/Hallandale Beach Boulevard to SR-820/Hollywood Boulevard (FM 436903-1-22-02) with the focus to improve interchange and ramp terminals intersection capacity at Hallandale Beach Boulevard, Pembroke Road, and Hollywood Boulevard. South of this PD&E study limits, FDOT District 6 is conducting a PD&E study along I-95 from SR-860/Miami Garden Drive to Miami/Broward County Line (FM 414964-1-22-01). The District 4 Planning and Environmental Management Office (PLEMO) has retained CTS Engineering, Inc. to perform traffic data collection and traffic forecasting and projection (no-build condition) for the PD&E study. This report describes the methodology and presents the results of the data collection and traffic projection efforts. The following tasks have been performed under this study:

Task 1. Traffic Data Collection Methodology

This task is to collect traffic data within the study limits of the PD&E and summarize traffic data under the existing transportation conditions. The major subtasks include the following:

- **Perform full intersection counts:** Three-day full intersection data collection was conducted for the intersections along three study corridors: Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor.
- **Conduct interchange 72-hour classification counts:** Three-day vehicle classification counts were collected at the ramps of the interchanges for I-95 at Ives Dairy (5 ramp locations), Hallandale Beach Boulevard (4 ramp locations), Pembroke Road (4 ramp locations), Hollywood Boulevard (4 ramp locations), and I-595 (8 ramp locations).
- **Collect I-95 Express Lanes traffic data using video cameras:** Three-day traffic and class counts were collected for express lanes within the study limits from north of Ives Dairy Road to south of I-595 through image processing.

- **Collect and summarize vehicular Origin-Destination (OD) Data:** StreetLight[1] data was obtained to prepare the OD matrix between selected locations from south of Ives Dairy Road to north of I-595 along I-95**.**
- **Perform arterial 72-hour counts:** Three-day vehicle classification counts were collected at four locations: Sheridan Street east of N 29th Avenue, Stirling Road west of Compass Road, Griffin Road east of I-95 NB ramp, and Griffin Road west of I-95 SB ramp.

Task 2 – Traffic Projections Methodology

As part of this study, traffic projections were prepared for future year (2045) under the No-Build conditions. Based on the coordination with the Department, the No Build conditions are defined as transportation network with the inclusion of Cost Feasible Plan improvements in the adopted MPO 2045 Long Range Transportation Plan (LRTP). In addition, preferred alternative from the I-95 PD&E study from Hallandale Beach Boulevard to Hollywood Boulevard are included as part of the No-Build conditions. Subtasks under this task include the following:

- **Data Gathering for Project Traffic from Past Studies:** The traffic projections and forecasts were collected for the I-95 PD&E Study from Hallandale Beach Boulevard to Hollywood Boulevard PD&E, the I-95 Corridor Planning Study led by FDOT District 6, and the I-95 PD&E study from Miami Garden Drive to Miami/Broward County Line led by District 6, in proximity to the study limits. Coordination has been carried out with the I-95 Express Team, I-95 PD&E Team from Hallandale Beach Boulevard to Hollywood Boulevard, and District 6's I-95 PD&E Team south of the county line to ensure traffic projections and improvements from various sources are considered.
- **Subarea Model Forecast for No-Build Conditions:** The socioeconomic data, network coding, and other model settings were reviewed to make sure they are consistent with the base year (2021) conditions. A future year (2045) no-build network in Southeast Florida Regional Planning Model (SERPM) was developed based on the 2045 Cost Feasible Plans adopted by the three MPOs in the region. The no-build network also includes the proposed improvements from the aforementioned projects in coordination with the Department.
- **Future Traffic Projections:** Trends analysis was conducted using the historical traffic counts. The growth factors were calculated using the population and employment data obtained from the SERPM model. A set of recommended growth rates were proposed based on the trends analysis, socioeconomic data, and model volumes for all approaches at the study intersections. The growth rates were applied to current AADT volumes to obtain projections for the open year (2021), interim year (2030), design year (2045) and 2050. Coordination was carried out to ensure the AADT projections at the county line along I-95 are consistent with the AADT forecasted by the I-95 PD&E Team south of the county line.

Figure 1 presents the study corridors, ramps, and intersections of this study. The rest of this report documents the methods and results of abovementioned tasks.

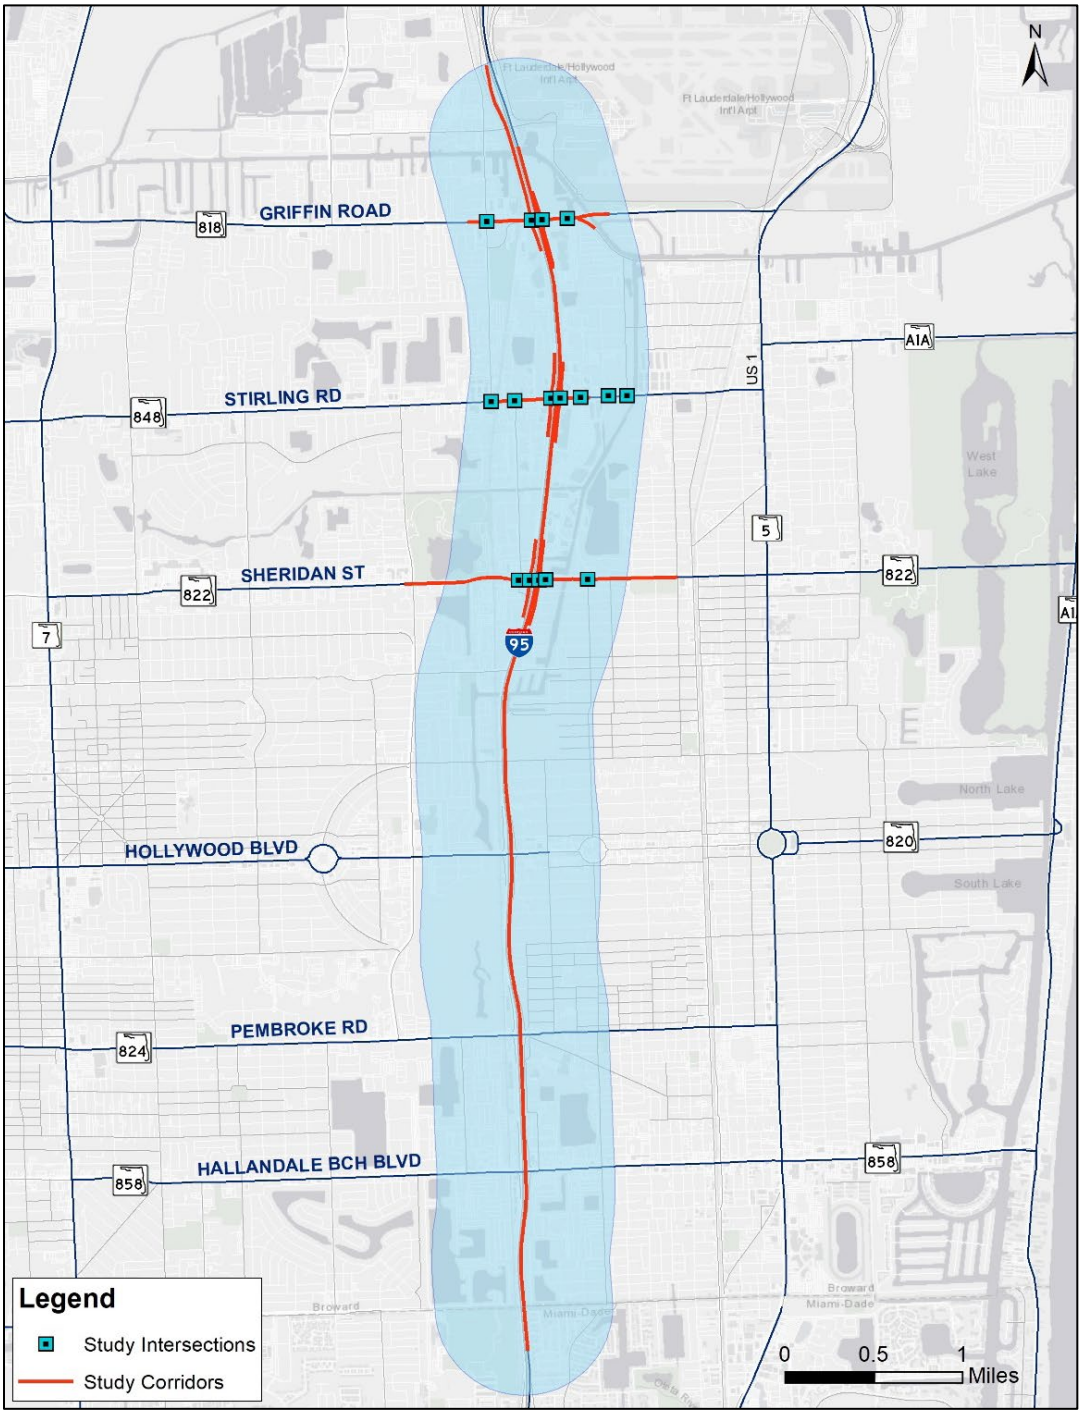

Figure 1. Study Corridor and Study Intersections

2. TRAFFIC DATA COLLECTION

This section documents the traffic data collection efforts conducted as part of this TWO. Figure 2 presents the locations for turning movement counts and ramp classification counts. Appendix A presents all traffic data collected in this study.

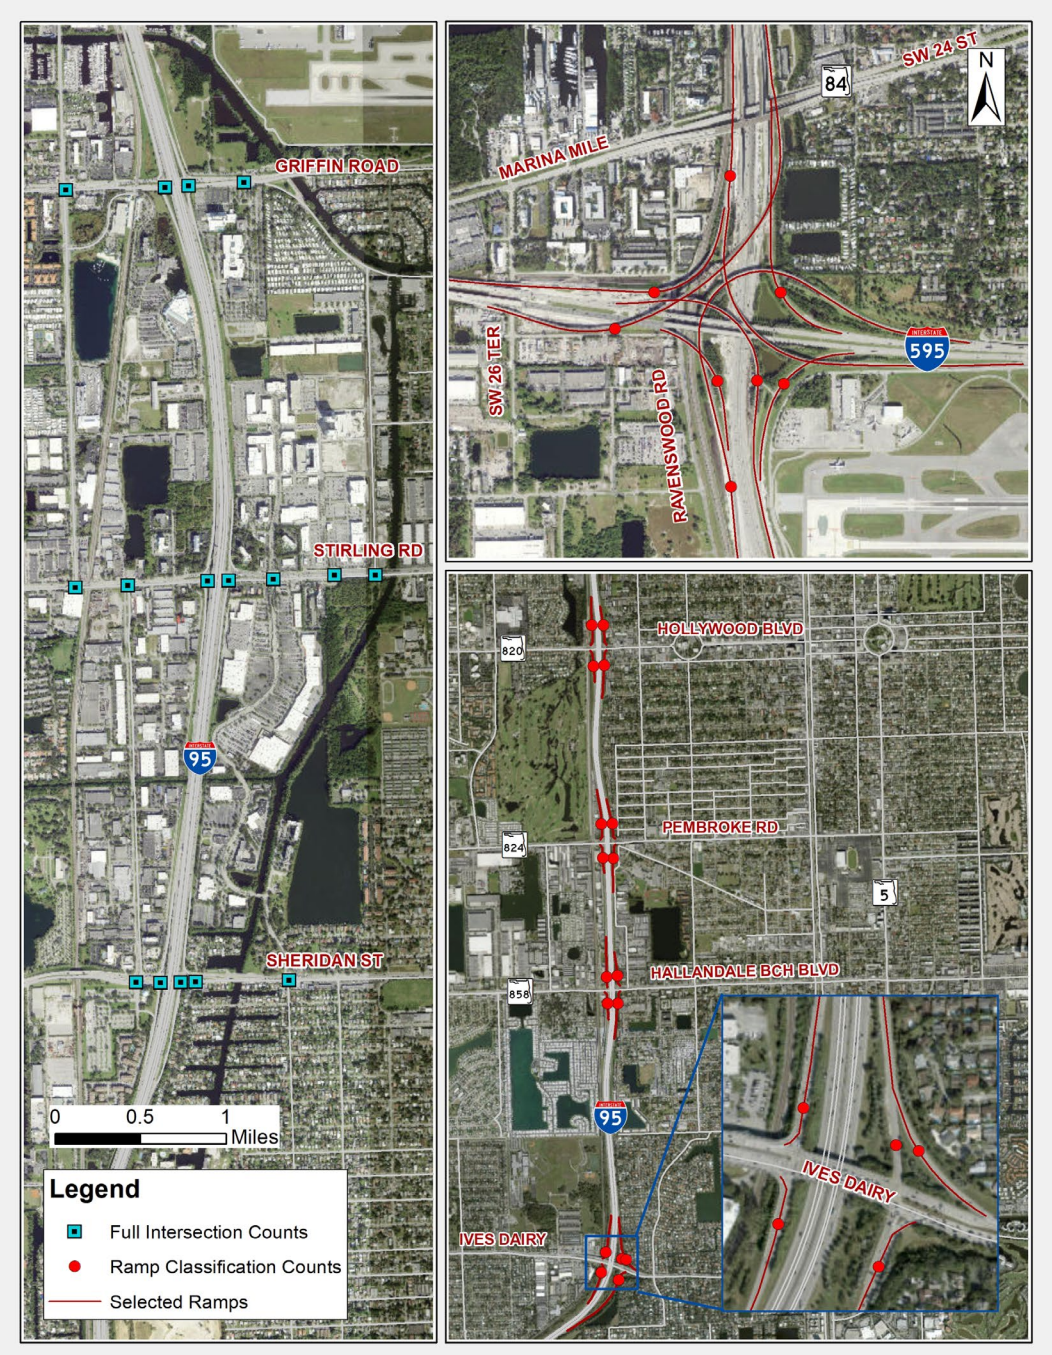

Figure 2. Intersection Counts and Ramp Class Counts Locations

2.1 Full Intersection Counts

Three-day full intersection data collection was conducted for 16 intersections along three corridors where interchange improvements were proposed: Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor. Full intersection data collection includes 6-hour peak period turning movement counts (6:00 AM to 9:00 AM, 4:00 PM to 7:00 PM), and 72-hour link counts for three consecutive weekdays (Tuesday to Thursday). Seventy-two-hour vehicle classification counts were conducted on I-95 ramps. Additional classification counts were also collected along the following arterial roads:

- Sheridan Street east of N 29th Avenue
- Stirling Road west of Compass Road
- Griffin Road east of I-95 NB ramp
- Griffin Road west of I-95 SB ramp

The dates and locations for full intersection counts for Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor are presented in Table 1 to Table 3, respectively.

Table 1. Full Intersection Counts along Sheridan Street Corridor

Data Collection Dates	Turning Movement Counts	72-Hour Counts	
	Count Location	Count Type	Count Location
11/9/2021-11/11/2021	I-95 NB Off Ramp Terminal at Sheridan Street	Classification	I-95 NB On Ramp N of Sheridan Street

		I-595 WB Off Ramp to SB I-95

2.3 Express Lane Data Collection

Video cameras were used to monitor express lanes traffic within the study limits from south of I-595 to north of Ives Dairy Road. Images were taken at the two ingress and two egress points of the express lanes for three consecutive weekdays (Tuesday to Friday). Then, images were processed to determine the number and class of vehicles in and out of the express lanes. Seventy-two-hour counts were reported in the same manner as the turning movement counts in 15-minute interval. The dates and locations of express lane camera data collection are summarized in **Table 5**.

Table 5. Express Lane Camera Data Collection

Data Collection Dates	Ingress/Egress Point	Count Location
11/9/2021-11/11/2021	Ingress	I-95 Express Lanes N of Ives Dairy Road, NB
11/9/2021-11/11/2021	Egress	I-95 Express Lanes N of Ives Dairy Road, SB
11/16/2021-11/18/2021	Ingress	I-95 Express Lanes S of I-595, SB
11/9/2021-11/11/2021	Egress	I-95 Express Lanes S of I-595, NB

3. TRAFFIC DATA SUMMARY

This section documents the methodology used to develop base year (2021) traffic volumes, including the annual average daily traffic (AADT) volumes, peak hour approach volumes, and peak hour turning movement counts.

For this study, the three-day average traffic volumes were used, together with the applicable axle correction factors and seasonal factors (**Appendix A-5** and **Appendix A-6**) that are published on FDOT Florida Traffic Online (2019), to calculate the 2021 AADTs for each approach of the study intersections. For classification counts, since the number of vehicles were collected instead of axles, axle correction factors were not applied. The 2021 AADT at I-95 south of Hallandale Beach Boulevard was calculated based on counts at two FDOT sites (#862487 and #861487). Other I-95 mainline 2021 AADTs were calculated based on ramp volumes and the 2021 AADT at I-95 south of Hallandale Beach Boulevard. The observed daily traffic counts, average daily counts, and calculated 2021 AADTs are presented in **Table 6** and **Appendix A-7**. Then, the calculated AADTs were balanced in coordination with the Project Team from FDOT District 6 that is conducting the I-95 PD&E Study from north of Golden Glades Interchange (GGI) to south of Hallandale Beach Boulevard. Balanced 2021 AADTs are presented in **Table 6** and illustrated in **Figure 3**.

The peak hours for the study corridor were determined based on the observed turning movement counts collected along Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor. The observed AM peak hour is 7:30 AM to 8:30 AM, and the observed corridor's PM peak hour is 5:00 PM to 6:00 PM. To estimate base year (2021) peak hour volumes, the average values of 3 days observed counts during corridor peak hours were calculated. Then, the average peak hour counts were rounded up to the nearest 5. The rounded peak hour volumes are showed in **Appendix A-8**. Finally, the rounded peak hour turning movement counts were balanced in coordination with the Project Team from FDOT District 6 that is conducting the I-95 PD&E Study from north of Golden Glades Interchange (GGI) to south of Hallandale Beach Boulevard. The base year (2021) balanced peak hour turning movement volumes and approach volumes are presented in **Figure 4**.

4. ORIGIN-DESTINATION ANALYSIS

To provide an understanding of the travel pattern along the corridor and provide information for PD&E study stage, StreetLight data was downloaded for 80 zones along I-95 from south of Ives Dairy Road in Miami-Dade County to north of Davie Boulevard in Broward County. The origin-destination (OD) locations are showed in **Figure 5** and summarized in **Table 7**.

All Streetlight Data was obtained for one month (September 2021). Only weekday daily data was selected for developing the traffic patterns along the study corridor. The origin-destination matrix for eighty StreetLight zones can be found in **Appendix D**. Eighteen StreetLight zones were selected to show the major flows from each crossing corridors as well as I-95. **Table 8** summarizes the origin-destination matrix for the selected zones.

The through traffic between I-95 south of Ives Dairy Road and I-95 north of Davie Road is about 26,000 for both directions.

For traffic started from I-95 south of Ives Dairy Road, the major destinations are Ives Diary Road east of I-95 (11,600), Hallandale Beach Boulevard Off Ramps (11,500), Pembroke Road Off Ramps (7,400), Hollywood Boulevard Off Ramps (6,800), and I-595 east (4,200) and west (5,700) of I-95.

For traffic started from Ives Dairy Road, about 10,500 vehicles stayed on Ives Dairy Road travelling to the east and west. Among the traffic started from Ives Dairy Road east of I-95, about 9,800 vehicles travelled to Miami along I-95, about 4,600 vehicles went to I-595 west of I-95, and about 4,600 vehicles travelled to I-95 North of Davie Road. Among the traffic started from Ives Dairy Road west of I-95, about 6,200 vehicles travelled to Miami along I-95.

For traffic getting on I-95 from Hallandale Beach Boulevard, about 13,000 vehicles travelled to Miami along I-95, about 4,000 vehicles went to I-595 west of I-95, and about 4,300 vehicles travelled to I-95 north of Davie Road.

For traffic getting on I-95 from Pembroke Road, there are about 7,400 vehicles travelling to Miami along I-95, about 7,000 vehicles getting off I-95 from Hallandale Beach Boulevard, and about 4,800 vehicles travelling to I-95 north of Davie Road.

For traffic getting on I-95 from Hollywood Boulevard, there are about 7,300 vehicles travelling to Miami along I-95, about 4,100 vehicles getting off I-95 from Hallandale Beach Boulevard, about 4,500 vehicles getting off I-95 from Pembroke Road, about 4,200 vehicles going to I-595 west of I-95, and about 5,200 vehicles travelling to I-95 north of Davie Road.

For traffic started from Griffin Road, the majority of traffic (6,200 – 6,600) stayed on Griffin Road travelling to the east and west, and about 2,300 – 2,400 vehicles travelled to Miami along I-95. About 1,900 vehicles from Griffin Road east of I-95 and about 3,400 vehicles from Griffin Road west of I-95 travelled to I-95 north of Davie Road.

For traffic started from Stirling Road, the majority of traffic (8,700 – 8,800) stayed on Stirling Road travelling to the east and west, and about 2,000 vehicles travelled to Miami along I-95 from both directions. Among the traffic started from Stirling Road east of I-95, about 2,700 vehicles went to I-595 west of I-95, and about 2,500 vehicles travelled to I-95 North of Davie Road. Among

the traffic started from Stirling Road west of I-95, about 1,600 vehicles got off I-95 from Hallandale Beach Boulevard, about 1,500 vehicles went to I-595 west of I-95, and about 2,800 vehicles travelled to I-95 north of Davie Road.

For traffic started from Sheridan Street, the majority of traffic (9,000 – 9,200) stayed on Sheridan Street travelling to the east and west. Among the traffic started from Sheridan Street east of I-95, about 3,300 vehicles went to I-95 South of Ives Diary Road, about 3,800 vehicles went to I-595 west of I-95, and about 3,900 vehicles travelled to I-95 north of Davie Road. Among the traffic started from Sheridan Street west of I-95, about 2,300 vehicles went to I-95 south of Ives Diary Road, about 2,000 vehicles got off I-95 from Hallandale Beach Boulevard, about 1,500 vehicles went to I-595 west of I-95, and about 3,900 vehicles travelled to I-95 north of Davie Road.

For traffic started from I-595 east of I-95, 26,400 vehicles travelled to I-595 west of I-95, 4,900 vehicles travelled to I-95 south of Ives Diary Road, and about 9,000 vehicles travelled to I-95 north of Davie Road.

For traffic started from I-595 west of I-95, 25,000 vehicles travelled to I-595 east of I-95, 5,200 vehicles travelled to I-95 south of Ives Diary Road, and about 28,600 vehicles travelled to I-95 north of Davie Road.

For traffic started from I-95 north of Davie Road, the major destinations are I-595 east (10,000) and west (26,000) of I-95, Hollywood Boulevard Off Ramps (5,600), Pembroke Road Off Ramps (5,400), and Hallandale Beach Boulevard Off Ramps (5,300).

5. TRAFFIC FORECAST

Various traffic forecast methods were evaluated in this study to identify the most reasonable growth rates along the study corridor. Table 9 summarizes three methods to estimate traffic growth rates that were explored in this study.

Table 9. Growth Rate Estimation Methods

Method	Description
Historical Trend	Growth rates are developed based on regression analyses of at least five years of most recent historical AADTs using FDOT Trend Analysis Spreadsheet. The count stations include: • 860027: SR 818 /Griffin Road - E of I-95 W of Old Griffin Road • 860032: SR 848 /Stirling Road - 700' E of SR 9/I-95 • 860034: SR 822 /Sheridan Street - E of SR 9/I-95 • 860076: SR 818 /Griffin Road - W of SR 9/I-95 • 860092: SR 848 /Stirling Road - W of SR 9/I-95 • 860133: SR 848 /Stirling Road - W of Ravenswood Road • 860331: SR 9/I-95, 0.1 Mile N of SR-858/Hallandale Beach Boulevard, Broward • 860631: Old Griffin Road - East of SR-818/Griffin Road (Dummy Site From EB 867319) • 861487: SR 9/I-95 - S of SR 858/Hallandale Beach Boulevard (Express Lanes) • 862454: SR 9/I-95 - S of SR 822/Sheridan Street • 862455: SR 9 / I-95 - S of SR 848/Stirling Road • 862456: SR 9 / I-95 - S of SR 818/Griffin Road • 862458: SR 9 / I-95 - S of SR 862/I-595 • 862487: SR 9/I-95 - S of SR 858/Hallandale Beach Boulevard • 865173: SR 822 / Sheridan Street - W of I-95 500' W of CSX R/R • 865299: SR 818 / Griffin Road - W of US 1 • 868124: Ravenswood Road, S of Griffin Road • 869349: N 29 Avenue, S of Stirling Road
Model Volume Growth	Growth rates are the annual compound growth rates in model AADTs from model base year (2015) to model forecast year (2045).
Socioeconomic Growth	Growth rates are the annual population/employment compound growth rates within the 2-mile buffer around study interchange from model base year (2015) to model forecast year (2045).

Three types of historical trend analyses were conducted: straight line growth, exponential growth and decaying exponential growth. For each location with historical counts, the type of trend analysis with the highest R-squared was selected to produce the final historical growth rate. Historical trend analysis results are presented in **Appendix C**. The historical AADT volumes for all the FDOT count stations are presented in **Appendix A-4**.

Model volume growth rates were calculated using the model AADTs on corresponding model links based on the outputs of the latest regional travel demand model – SERPM 8.513. The model base year is the model validation year 2015 with 2015 socioeconomic data and 2015 transportation network. The model future year is the regional LRTP horizon year of 2045. The 2045 No-Build network was developed in close coordination with FDOT District 4 and District 6 Project Managers and District 6 I-95 PD&E Project Team with support from District 4's I-95 PD&E from Hallandale Boulevard to Hollywood Boulevard Team. The 2045 No-Build network was built by incorporating the Locally Preferred Alternative (LPA) from the I-95 Corridor Planning Study and Golden Glade Interchange (GGI) Ultimate Design as provided by FDOT. The base year 2015 and future year 2045 model volumes along study corridor are presented in **Appendix B-1** and **Appendix B-2**, respectively.

The socioeconomic growth rates were calculated based on SERPM 8.513's population and employment data. For this study, it was noted that the growth patterns might be different between areas east and west of I-95. Therefore, growth rates for the 2-mile buffers east and west of I-95 were developed separately. For each interchange, population and employment growth rates from model base year (2015) to model forecast year (2045) were calculated for three types of buffer areas: micro analysis zones (MAZs) located within 2-mile from the road intersecting I-95, MAZs located no more than 2-mile west of I-95, and MAZs located no more than 2-mile east of I-95. The population and employment data used to calculate the socioeconomic growth rates are presented in **Appendix B-3**.

After reviewing the growth rates calculated using three different forecast methods and adjacent land uses along the corridor, the most reasonable growth rates were recommended. The highest estimated growth rate was usually recommended to develop traffic projections, with two exceptions: (1) If all estimated growth rates were smaller than 0.5%, then a minimal growth rate of 0.5% was applied; (2) If the highest growth rate is not supported by adjacent land use development projection (e.g., existing development is closed to capacity), then a lower growth rate that is more consistent with estimated socioeconomic growth rates was recommended. All calculated and recommended growth rates are summarized in **Table 10**. The recommended growth rates were used to estimate future AADTs for interim year (2030), design year (2045) and 2050 (**Table 11**). Future volumes on C/D ramps from Hallandale Beach Boulevard to N of Hollywood Boulevard were estimated based on the On/Off ramp volumes and future lane geometry. For ramps with express lanes, each forecasted ramp AADT from I-95/I-595 to I-595/I-95 was split into two volumes: the AADT of the ramp from I-95/I-595 general purpose lane to I-95/I-595 general

purpose lane and the AADT from I-95/I-595 express lane to I-95/I-595 express lane. The split percentages were calculated using the 2045 model volumes from SERPM 8.513. **Figure 6**, **Figure 7** and **Figure 8** illustrate 2030 AADTs, 2045 AADTs and 2050 AADTs, respectively.

1.0 INTRODUCTION

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study along the segment of SR 9/I-95 extending from the Miami-Dade/Broward County Line to north of Griffin Road (FM. No. 439170-1-22-02). The PD&E Study limits extend along SR 9/I-95 for approximately 6.5 miles in Broward County, Florida. The project proposes to address deficiencies and improve safety and traffic operations at the existing interchanges and cross streets and enhance the express lanes along SR 9/I-95 from the Miami-Dade/Broward County Line to north of Griffin Road. A previous effort completed a separate Systems Interchange Modification Report (SIMR) for the southern interchanges of the PD&E Study limits from south of Hallandale Beach Boulevard to north of Hollywood Boulevard (FM#436903-1-22-02). FDOT is preparing a second SIMR to support the proposed modifications to the three northern interchanges - SR 818/Griffin Road, SR 848/Stirling Road, and SR 822/Sheridan Street. This document presents the 2021 Existing Conditions simulation model development and calibration results to support the SIMR with limits from south of Sheridan Street to north of Griffin Road. The simulation analysis was conducted using VISSIM 2022-07.

2.0 EXISTING OPERATIONAL CONDITIONS OVERVIEW

Traffic congestion is evident at several locations in the I-95 study area. Generally, traffic patterns are such that the peak direction during the AM peak period is northbound, while the peak direction during the PM peak period is southbound. Review of speed data from the Regional Integrated Transportation Information System (RITIS) revealed that there is significant daily variation in congestion within the project area. However, major trends were identified for each peak period.

The AM peak period experiences recurring congestion on I-95 in the northbound direction near the Sheridan Street on-ramp while the southbound direction experiences near free-flow conditions for the entire project area. The PM peak period experiences congestion in the northbound direction due to queue spillback from the I-95 northbound to I-595 westbound ramp. The southbound direction experiences congestion approximately between the I-595 overpass to the express lane ingress due to the I-595 major merge and high demand for the express lane facility.

3.0 SIMULATION STUDY AREA

The primary area of influence for this study is I-95 from south of Sheridan Street to north of Griffin Road, as shown in **Figure 1**. The simulation network includes three interchanges along I-95, including the following:

Interstate-95

1. Sheridan Street
2. Stirling Road
3. Griffin Road

Along the crossroads, the intersections included in the simulation network are as follows. All study area intersections are signalized, unless otherwise noted.

Sheridan Street

- N 29th Avenue
- SB I-95 Off-Ramp
- NB I-95 Off-Ramp
- N 28th Avenue (unsignalized)
- N 26th Avenue

Stirling Road

- Anglers Avenue
- NW 29th Avenue
- SB I-95 Off-Ramp
- NB I-95 Off-Ramp
- SW 18th Avenue/Oakwood Boulevard
- South Compass Way
- Bryan Road

Griffin Road

- Anglers Avenue
- SB I-95 Off-Ramp
- NB I-95 Off Ramp
- Old Griffin Road

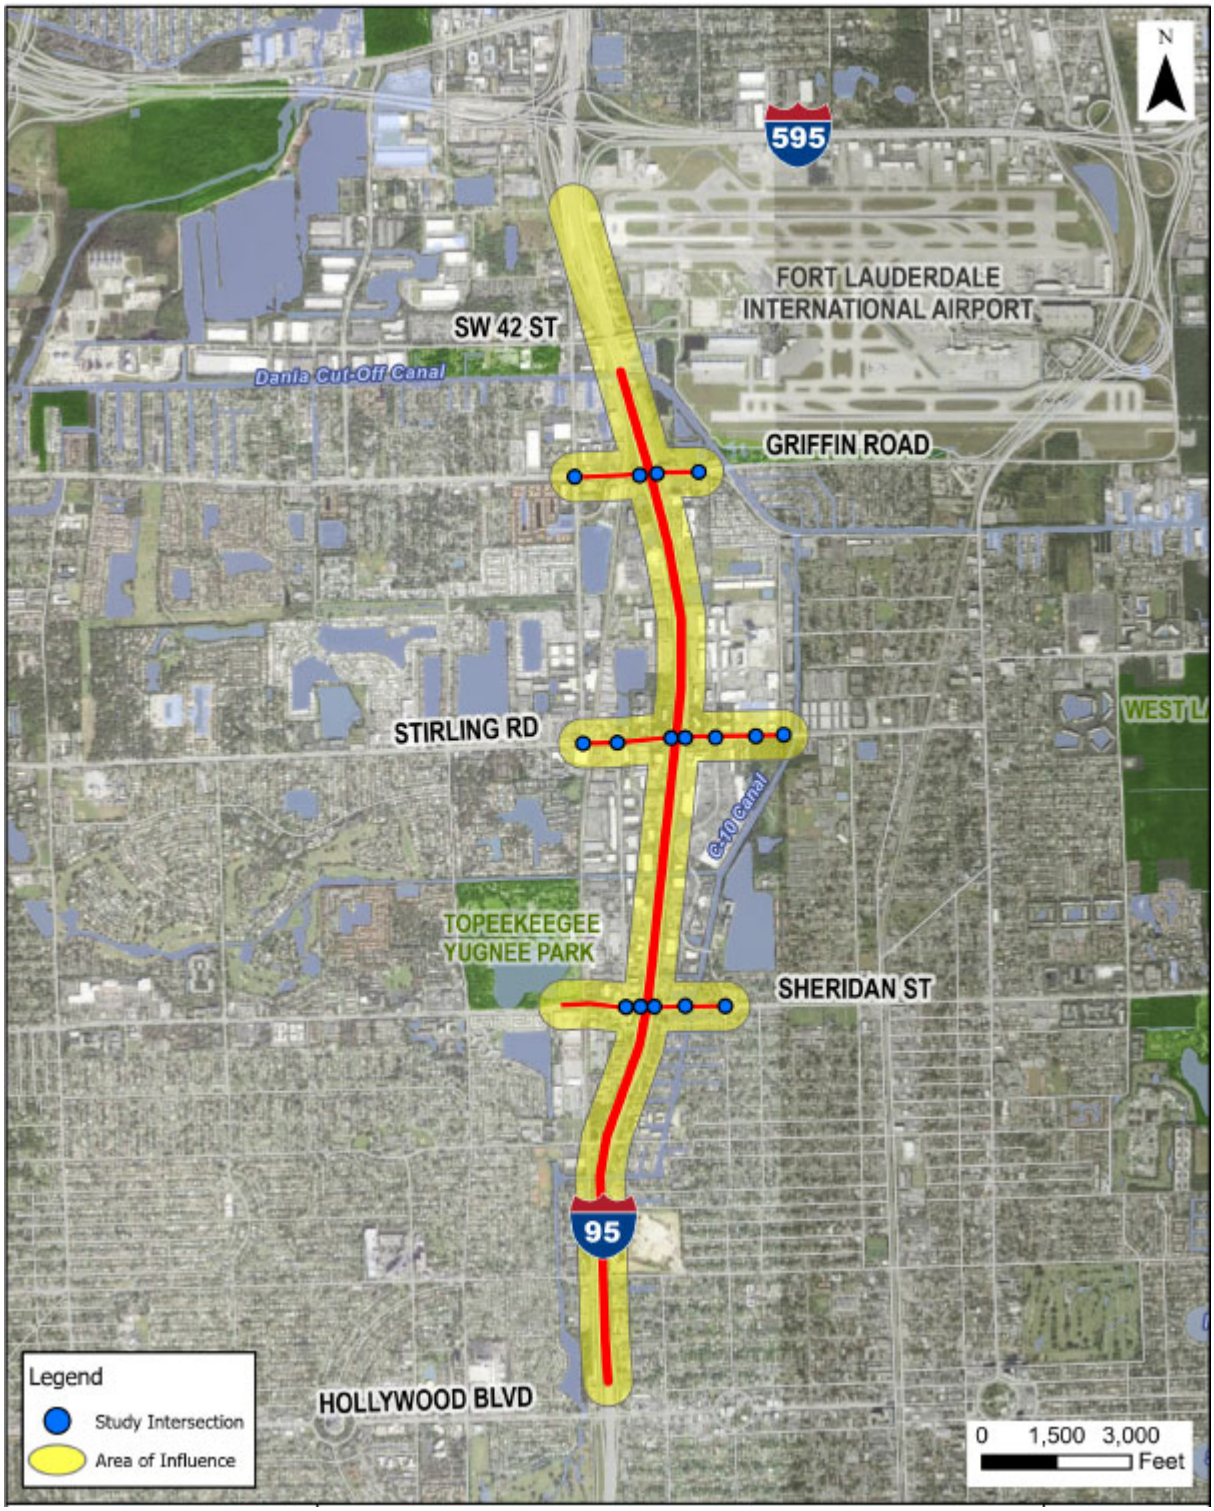

Figure 1 – Project Location and Area of Influence

4.0 SIMULATION MODEL DEVELOPMENT

Within the study area, the existing I-95 corridor is a limited access, eight-lane divided freeway facility with auxiliary lanes between interchanges. In the northbound direction an express lane facility terminates within the project area while in the southbound direction an express lane facility begins within the project area. The simulation analysis included the I-95 mainline travel lanes, I-95 express lanes, ramp merge/diverge areas, ramp terminal intersections, as well as adjacent signalized intersections. The VISSIM network elements were coded as described in the following sections and reviewed for accuracy and consistency. The simulation analysis was conducted using VISSIM 2022-07. The VISSIM Model Calibration Reviewer's Checklist is provided in **Appendix A**.

4.1 Roadway Geometry

The VISSIM network for the existing conditions analysis was constructed using orthorectified aerial photography (MrSid files) from 2021 obtained from FDOT. The use of MrSid files ensured that the network was scaled precisely and included the appropriate geometric configuration. A spreadsheet tool was used to configure the background files (.bgr) for all 14 MrSid files. In addition, field reviews and Google Earth were used for verification purposes and to confirm operational aspects such as right-turn-on-red and signal phasing (protected/permitted operation). The VISSIM network and background images are shown in **Figure 2**.

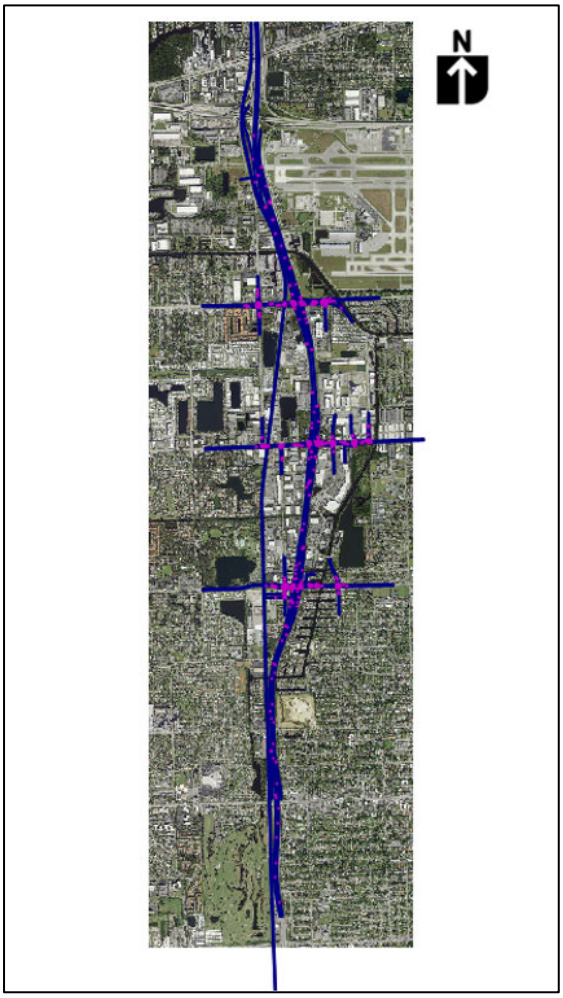

Figure 2 – VISSIM Simulation Network

To facilitate the network construction and assist in the calibration process, several link types and driving behavior sets were used, which include Freeway Basic, Freeway Merge/Diverge, Freeway Weave, Express Lane Basic, Express Lane Merge/Diverge, and Arterial. Each link type was coded with a different color to assist in error-checking as shown in **Figure 3**.

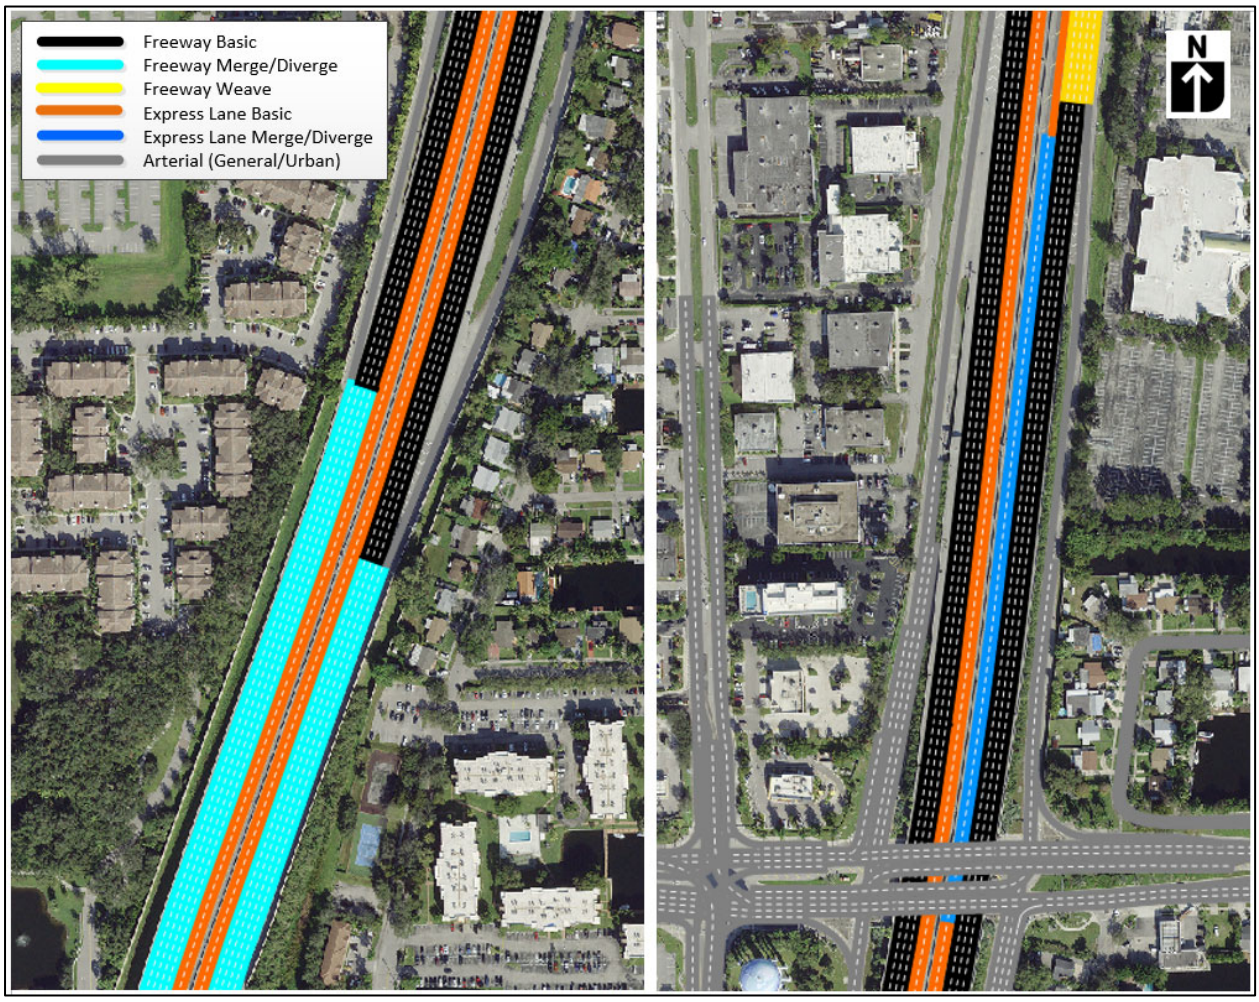

Figure 3 - Example of VISSIM Link Types

In addition, the links were coded in a manner to correlate with the most appropriate facility type. The general methodology for coding the links was as follows:

- **Arterial**: Links for arterial roadways and on-/off-ramps
- **Freeway Merge/Diverge**: Links with a length of 1,500 ft downstream of merge areas and 1,500 ft upstream of diverges
- **Freeway Weave**: Links between a closely spaced on-ramp and off-ramp
- **Freeway Basic**: All non-express lane links on I-95 outside the merge/diverge areas, weave areas.
- **Express Lane Merge/Diverge**: Express lane links with a length of 1,500 ft downstream of merge areas and 1,500 ft upstream of diverges
- **Express Lane Basic:** All express lane links outside the 1,500 ft merge and diverge areas

4.2 Railroad Operations

A major north-south railroad corridor (CSX) exists within the project area with two at-grade crossings and two railroad stations (Tri-Rail Commuter stations). The railroad corridor is located to the west of I-95. The at-grade crossings are located at Stirling Road and Griffin Road. Sheridan Street has a bridge structure spanning over the railroad tracks. The Tri-Rail Stations are located at Sheridan Street and Griffin Road.

In order to accurately simulate the train activities during both peak periods, the most recent weekday Tri-Rail train schedule was obtained and used as a reference to determine arrival times at each station. Furthermore, the *November 2016 Railroad Grade Crossing Data Collection and Analysis* (2016 Rail report) report was referenced to estimate the overall train dwell time at each station (**Appendix B**). The Fort Lauderdale Airport Station just south of Griffin Road was used as the anchor station to schedule the train arrivals for the network. Using an average transit speed of 40 mph, consistent with the southern SIMR project, it was determined that the train takes approximately three minutes and 7 seconds to reach the Fort Lauderdale Airport Station from the southbound entry link and approximately twelve minutes and 38 seconds from the northbound entry link. The time at which the train arrives at the station along with the time it takes for the train to travel from the entry link to the Fort Lauderdale Airport Station and the simulation start time was used to back calculate the time the train should enter the network in order to arrive at the station according to schedule. This process was done for both the northbound and southbound trains for both peak periods. According to the data obtained from the 2016 Rail report, the average time the train remains at the station is approximately 27 seconds. Therefore, a dwell time of 30 seconds was used.

Additionally, the 2016 Rail report stated that the median crossing duration for the train at various sample locations ranged from one minute and five seconds (Taft Street) to one minute and 47 seconds (Griffin Road). Per the *Third Edition of the Highway Rail Crossing Guidebook*, a minimum warning time of 20 seconds (gate down) is required before the train arrives at the crossing and the gate arm should return to its upright position in no more than 12 seconds (gate up). Therefore, considering a dwell time of 30 seconds for boarding/alighting at the Fort Lauderdale Airport Station, an additional 45 seconds of warning time were included to match the observed one minute and 47 seconds median crossing duration at the at-grade Griffin Road crossing. The duration for the gates to remain closed at the at-grade crossing at Stirling Road included an additional 30 seconds of warning time to match the observed one minute and 5 second median crossing duration at Taft Street which is most similar to the crossing at Stirling Road.

The gate closure duration along with the train speed was then used to calculate the distance in which the detector must be placed on the railroad corridor to allow for the needed gate closure time at each at-grade crossing in both directions. Pre-emption data from the signal timing plans was also referenced to determine the correct phases for track clear, dwell, and return for each at-grade crossing and corresponding interchange.

4.3 Speed Distributions

The Desired Speed Decisions and Reduced Speed Areas were coded in VISSIM based upon the type of roadway segment/facility. Desired Speed Decision points are used for assigning permanent speed distributions along the network, such as encountering a speed limit sign or entering/exiting the freeway. Most of the Desired Speed Decisions for the study area were based on the posted speed limits. Reduced Speed Areas are used for assigning temporary speed distributions, such as loop ramps and arterial turns. The speed distributions used for the study are included in **Table 1**.

Table 1 - Speed Distributions

Facility/Segment	Speed by Vehicle Type (mph)	Minimum (mph)	Maximum (mph)
I-95	Cars/Trucks - 65	57.2	72.8
Off Ramps (as signed)	Cars/Trucks – 30	26.4	33.6
	Cars/Trucks – 35	30.8	39.2
	Cars/Trucks – 40	35.2	44.8
Left Turns/Channelized Right Turns	Cars/Trucks - 20	17.6	22.4
Right Turns, S Compass Way (NB)	Cars/Trucks – 15	13.2	16.8
U-Turns	Cars/Trucks – 10	8.8	11.2
76th Blvd (NB), 66th St (SB), DCOTA Entrance	Cars/Trucks - 20	17.6	22.4
29th Ave (NB at Sheridan St), 28th Ave, 18th Ave/ Oakwood Blvd	Cars/Trucks - 25	22.0	28.0
26th Ave, S Compass Way (SB), Bryan Rd, Old Griffin Road	Cars/Trucks - 30	26.4	33.6
29th Ave (Stirling Road and SB at Sheridan St), Anglers Ave	Cars/Trucks - 35	30.8	39.2
Sheridan St	Cars/Trucks - 40	35.2	44.8
Stirling Rd, Griffin Rd	Cars/Trucks - 45	39.6	50.4
I-595 Ramp	Cars/Trucks - 55	48.4	61.6

Note: The minimum and maximum speed ranges represent the average speed +/- 12%

4.4 Traffic Volume

4.4.1 Peak Hour Traffic Development

Peak-hour traffic volumes were developed and documented in the *Traffic Data Collection and Traffic Projections for the I-95 PD&E Study* report (**Appendix C**). The existing AM and PM peak-hour volumes are provided in **Figure 4**.

Peak period traffic movements were coded into the VISSIM models using static routes. In order to provide more realistic travel patterns and lane changing behaviors between the closely spaced interchanges, a freeway-ramp to freeway-ramp origin-destination (OD) matrix produced by the traffic data collection and projections effort was used to develop long static routes within the model networks. The paths from the OD matrix provided long static routes between the study area interchanges. Additional static routes were coded where the interchange-to-interchange routes ended to assign the arterial turning movement volumes.

Since this project focuses mainly on general use lane capacity improvements and arterial operational improvements, the Existing Conditions calibration focused mainly on replicating existing operations on the GUL mainline, the interchange ramps, and along the arterial cross streets. This project is not meant to evaluate the operating conditions of the express lanes and does not propose any changes in express lane access. Therefore, it was determined that the managed lanes facilities module was not needed. Static routes were used to assign vehicles to the express lanes. A similar methodology will be used for future conditions.

Due to the congestion observed during both AM and PM peak-hour periods, multi-hour simulations having 15-minute intervals were developed for each peak period (**Appendix D**). The 15-minute intervals were

developed for each peak period based on the volume profiles at Florida Traffic Online (FTO) Stations 862394 (I-95 south of Hollywood Boulevard), 862454 (I-95 between Hollywood Boulevard and Sheridan Street), and 862455 (I-95 between Sheridan Street and Stirling Road). While the peak-hour for each period may have the highest traffic volume, the hour(s) following the peak-hour may experience more congestion than the peak-hour. Therefore, the simulation duration should be long enough so that the traffic congestion is alleviated or at least shows signs of recovery.

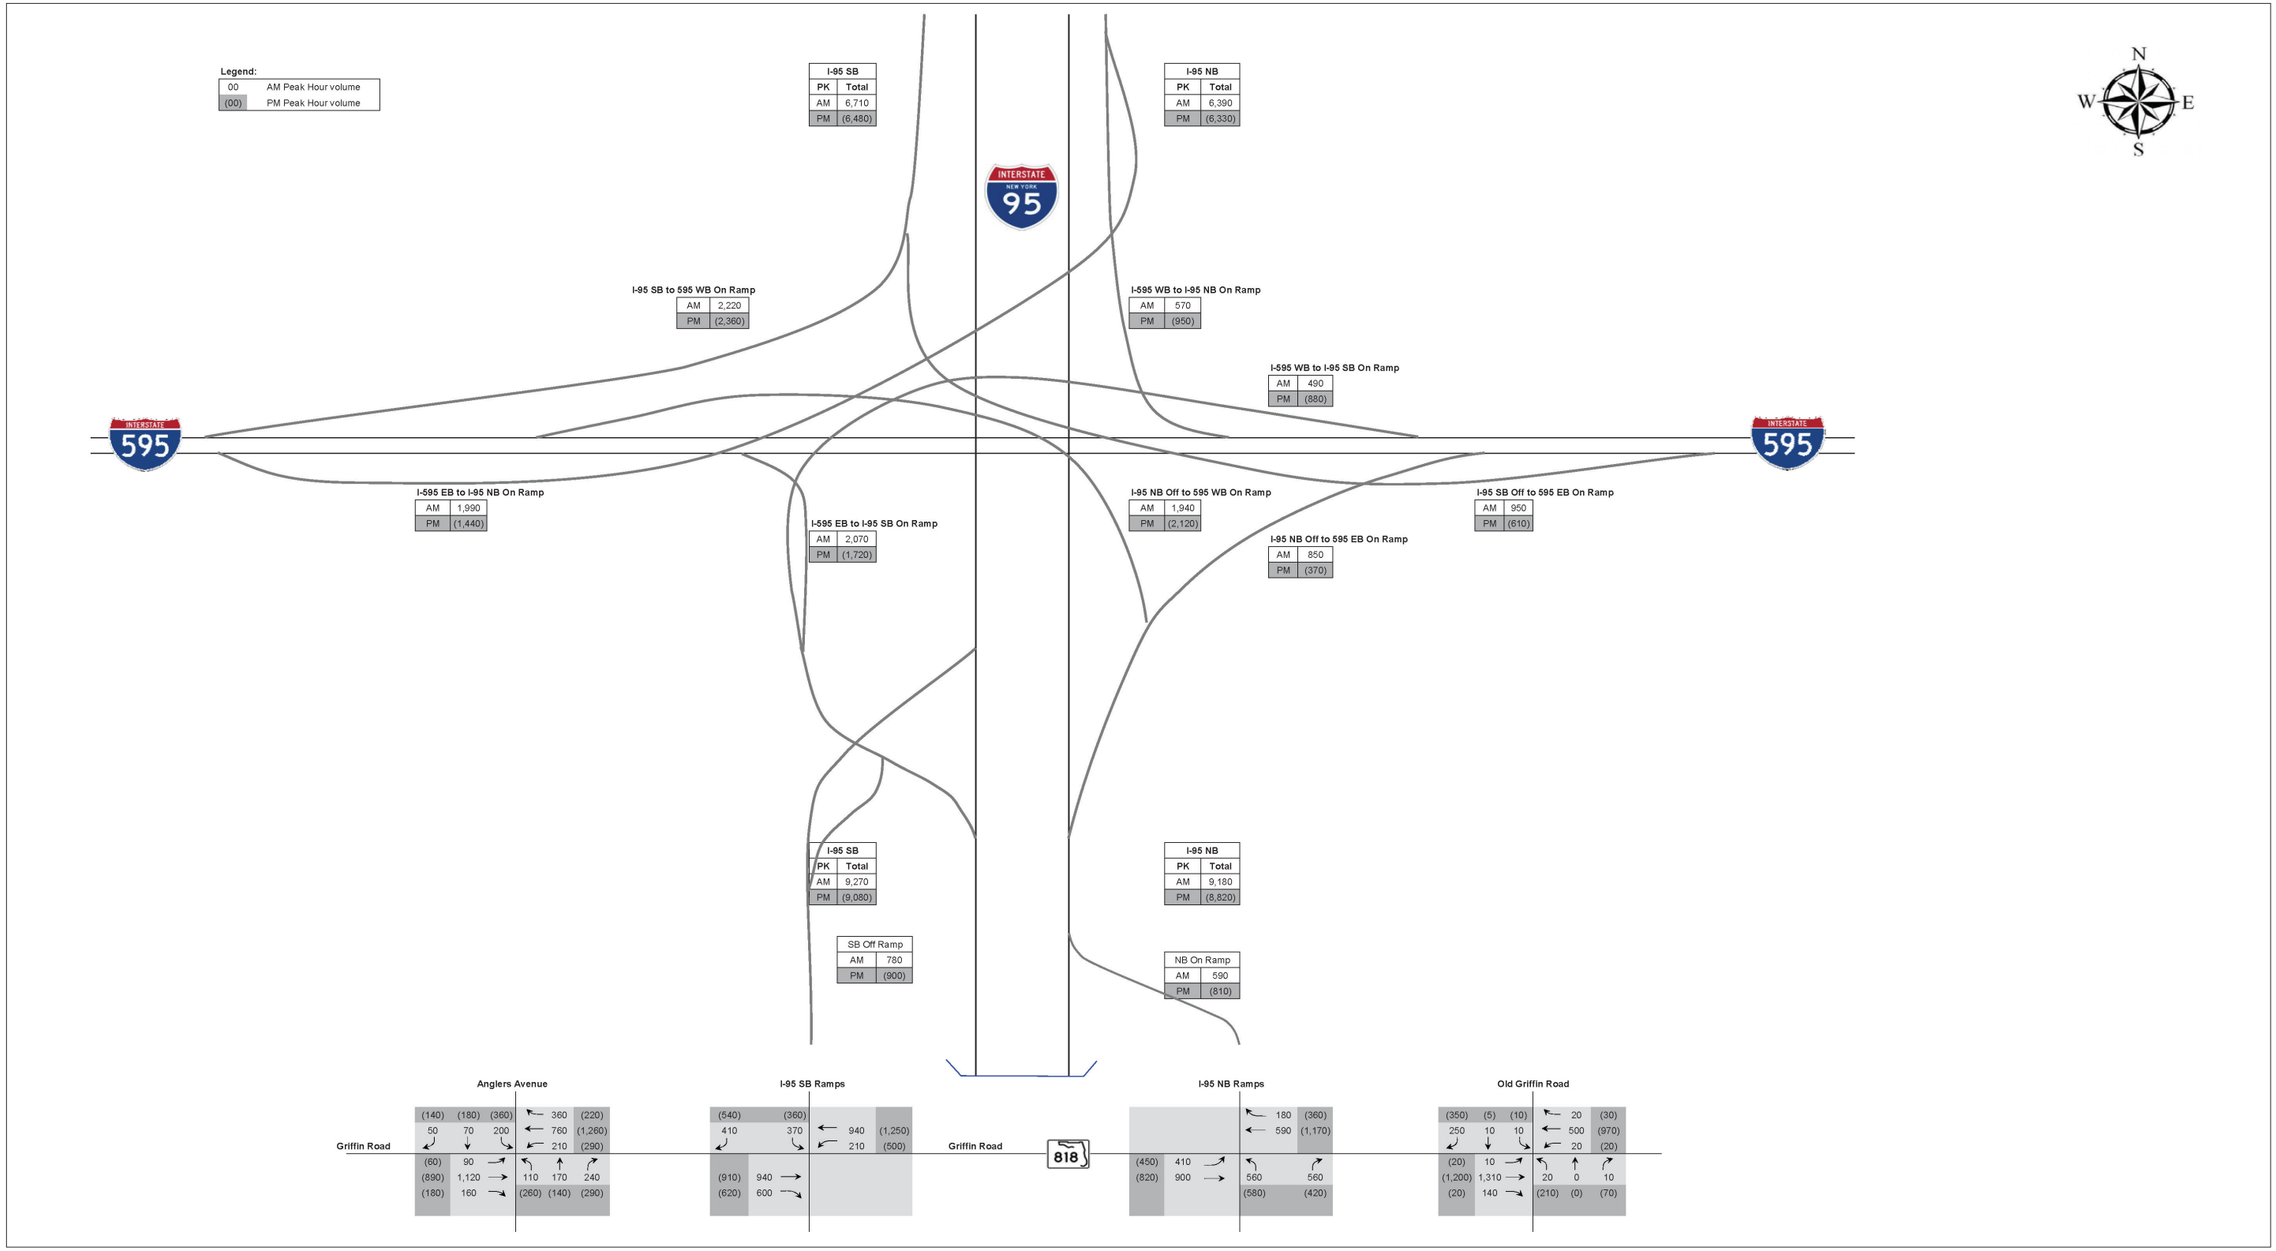

Figure 4. Base Year (2021) Peak Hour Volumes

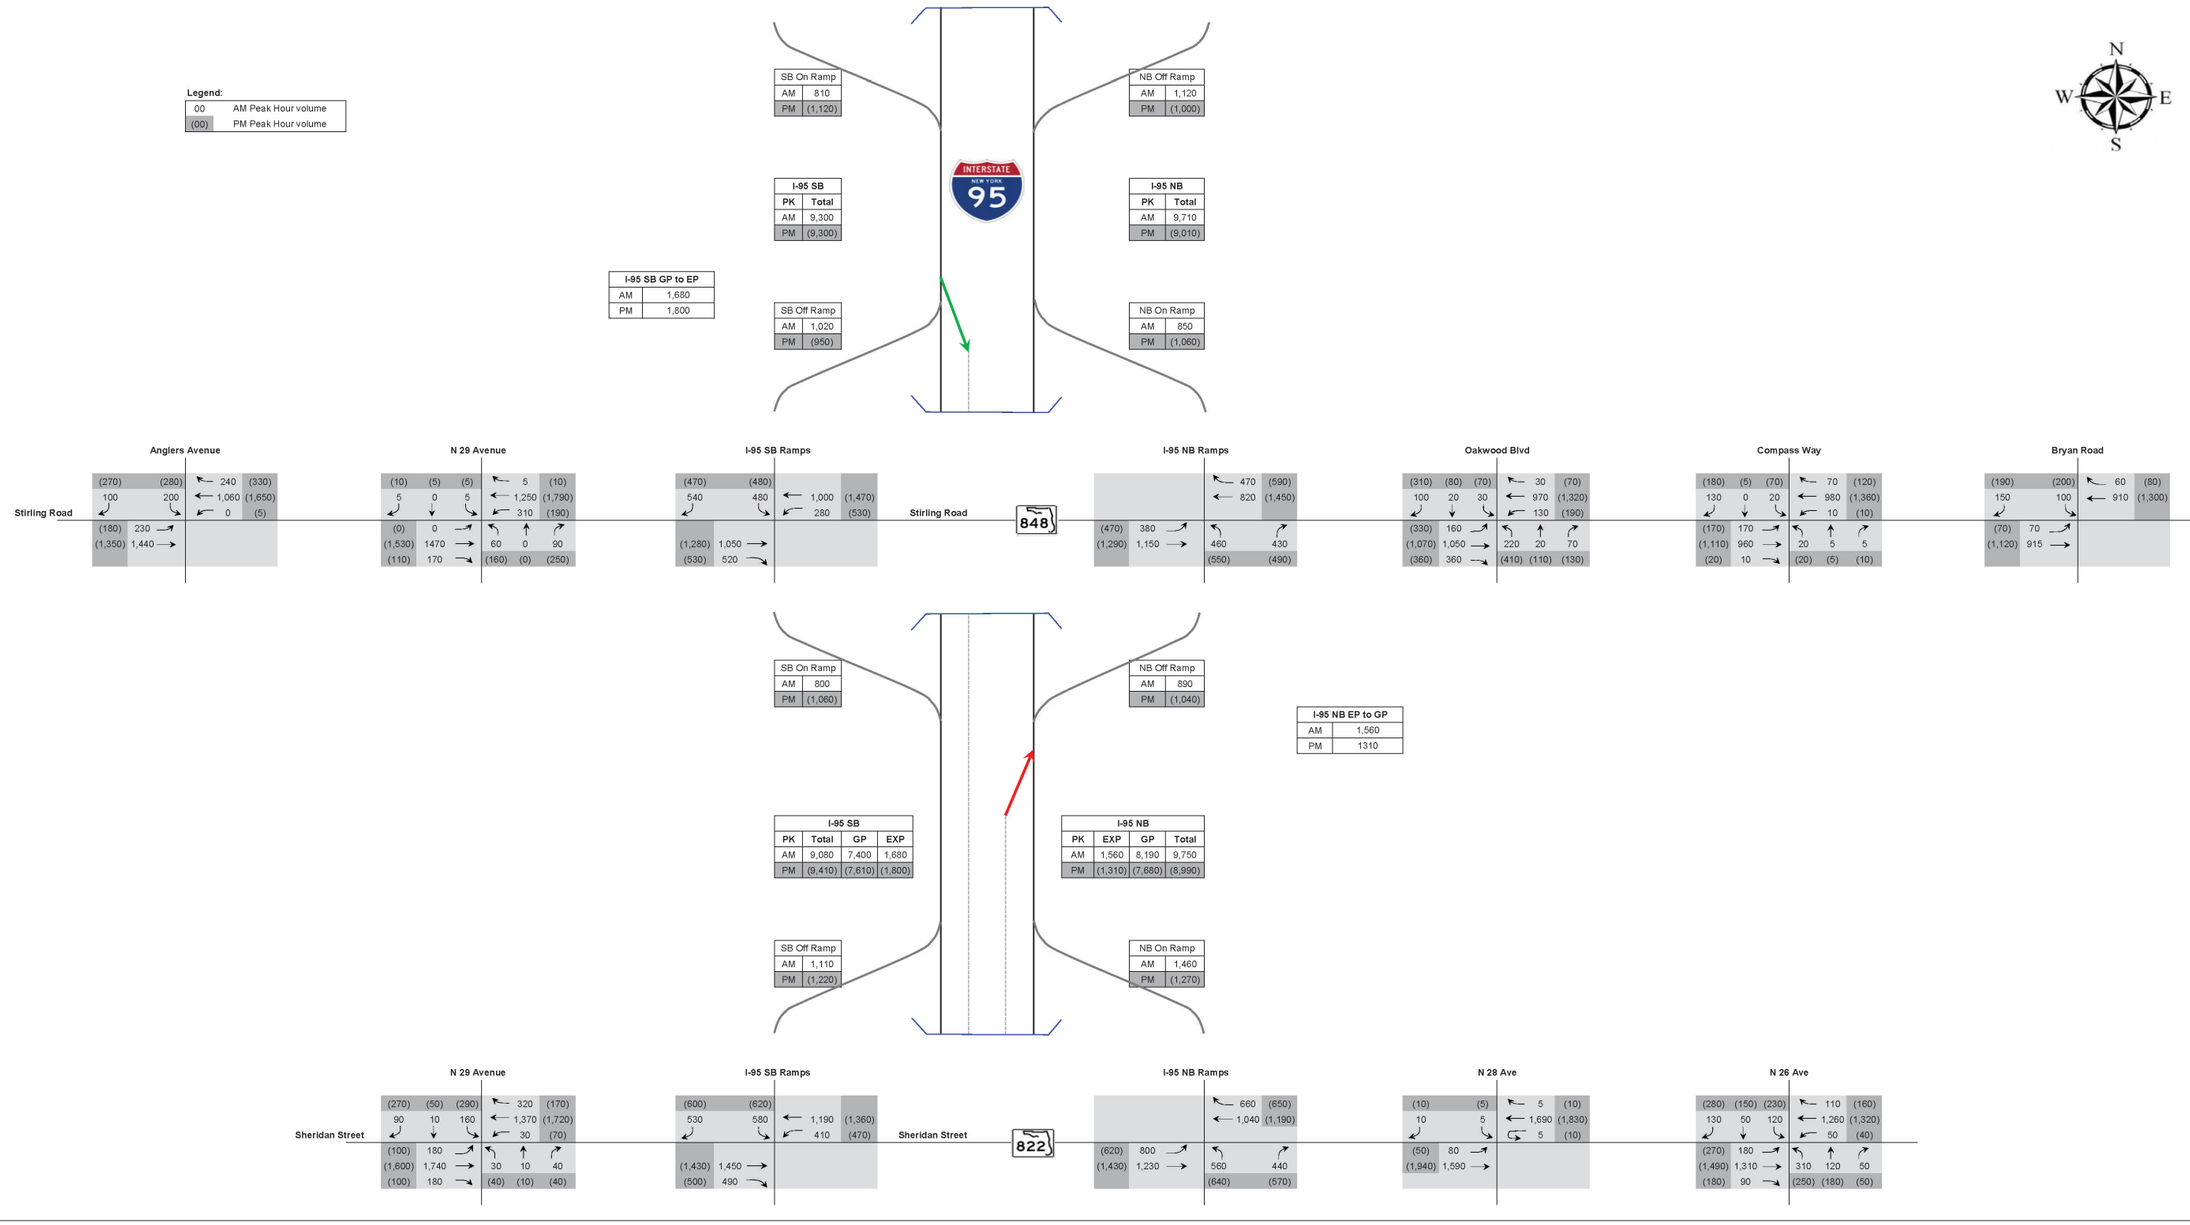

Figure 4. Base Year (2021) Peak Hour Volumes (Cont'd)

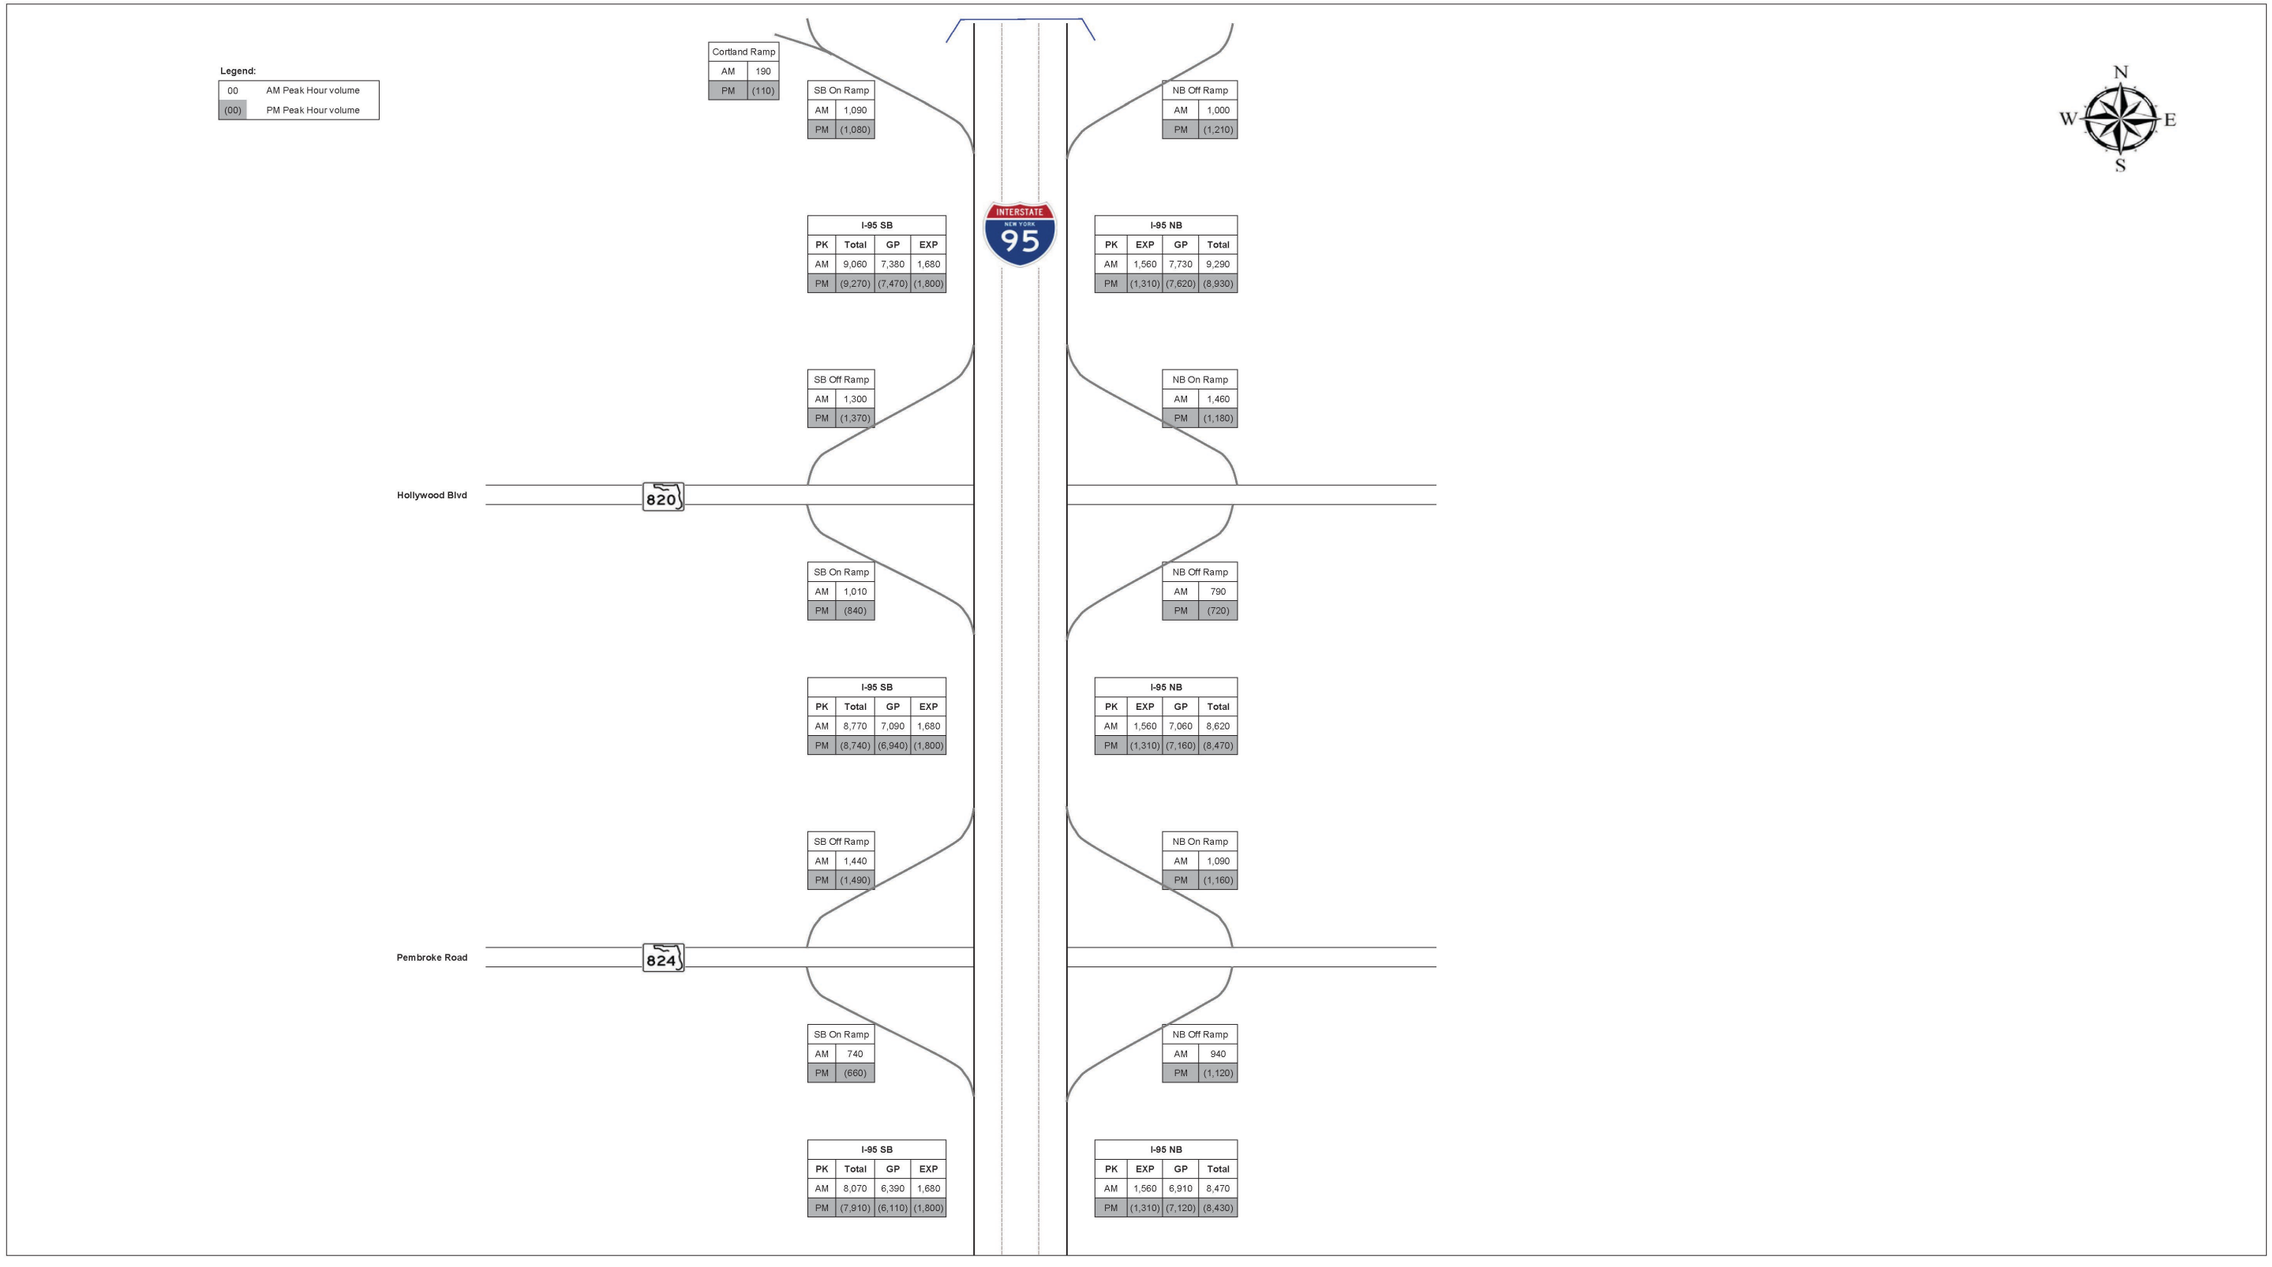

Figure 4. Base Year (2021) Peak Hour Volumes (Cont'd)

4.4.2 Vehicle Composition

Truck percentages for the peak-period analyses were determined by classification counts from 2022 FTO Data. A unique truck peak period percentage, which represents half of the daily truck percent, was selected for each major facility and held constant between the AM and PM peaks. The study area truck percentages are listed below in **Table 2**.

Table 2 – Study Area Truck Percentages

Roadway	Peak Period Trucks
I-95	3.0%
Hollywood Boulevard Ramps	2.0%
Sheridan Street	2.0%
Stirling Road	2.0%
Griffin Road	3.0%

Since the default vehicle models in VISSIM are based on European vehicles, The NorthAmericanDefault.inp file was used as a basis for the vehicle models in VISSIM. This base file contains revised vehicle fleet models/sizes that represent more accurately the vehicle fleet found in North America, based on 2005 car sales data. The passenger vehicle (cars, SUV, and light trucks) model distribution used in the VISSIM model is shown in **Table 3**.

Table 3 - Model Distribution for Passenger Vehicles

Name	Share (%)	Model	Length (ft.)
F-150	19.2	lttruck_ford_f150_2009	17.75
Silverado	15.1	lttruck_chevrolet_silverado_2008	21.89
Camry	13.5	car_toyota_camry_2006	15.57
Accord	12.9	car_honda_accord_2003	15.62
Explorer	10.6	suv_ford_explorer_2008	16.05
Quest	6.4	van_nissan_quest_1995	15.76
Altima	6.0	car_nissan_altima_2005	16.02
Cherokee	5.8	suv_jeep_grand_cherokee_2002	15.23
Voyager	5.5	van_plymouth_voyager_1999	16.01
Yukon	5.0	suv_gmc_yukon_xl_2008	17.83

The heavy vehicle type was divided into both single-unit trucks and tractor semi-trailer trucks. The heavy vehicle distribution is consistent with the SIMR covering the southern portion of the PD&E study area, from south of Hallandale Beach Boulevard to North of Hollywood Boulevard, which utilized a 2016 Florida Traffic Information (FTI now known as Florida Traffic Online) class count at site #860163. The heavy vehicle model distributions are shown in **Table 4**.

Table 4 - Model Distributions for Heavy Vehicles

Heavy Vehicle Class	Share (%)	Model (Tractor)	Model (Trailer)	Length (ft)
3-Axle Single Unit Truck	43.9	truck.v3d	-	33.51
4+-Axle Single Unit Truck	0.9	HGV_flatbed_truck.v3d	-	32.58
5-Axle Tractor Semi-trailer	43.4	HGV_wb50_tractor.v3d	HGV_wb50_trailer.v3d	55.00
4-Axle Tractor Semi-trailer	5.4	HGV_wb40_tractor.v3d	HGV_wb40_trailer.v3d	45.72
3-Axle tractor Semi-trailer	5.4	HGV_wb67d_tractor.v3d	HGV_wb67d_trailer.v3d	39.58
6-Axle Tractor Semi-trailer	1.0	HGV_wb65_tractor.v3d	HGV_wb65_trailer.v3d	73.58

4.5 Traffic Control Devices

Most of the intersecting roadways within the study area are controlled by traffic signals and operate under actuated-coordinated signal operations that incorporate various time-of-day signal plans to enhance traffic operation for varying traffic levels throughout the day. The signal timing and phasing data for the AM and PM peak periods were provided by Broward County. A total of 15 signalized intersections were included in the Existing Conditions simulation analysis. Intersections included in the analysis are listed in **Table 5** and the signal timing information is provided in **Appendix E**.

The signalized intersections were modeled using detectors, signal heads, stop signs for right-turn-on-red (when necessary), and incorporated the Ring Barrier Controller (RBC). Synchro 11 was initially used to develop the AM peak period RBC files. The PM RBC files were then developed based on the AM peak period files. The RBC files were refined as necessary in VISSIM to accurately replicate the provided timing/phasing information (e.g., incorporating overlaps, pattern schedules, modified detector mapping, etc.). Unsignalized intersections were coded with stop signs and/or conflict areas. Permissive left turns also incorporated conflicts areas. Precautions were also taken to minimize instances of vehicles stopping within intersections due to heavy downstream queueing – this was accomplished by using priority rules as needed, in areas where congested conditions were observed on the arterials.

Table 5 – Intersection Control Information

Arterial Roadway	Intersecting Roadway	Jurisdiction	Control	Cycle Length (AM/PM)
Sheridan Street	29th Avenue/I-95 NB and SB Ramp Terminals	Broward County	Signalized	Running Free
	28th Avenue	Broward County	Unsignalized	-/-
	26th Avenue	Broward County	Signalized	160/160
Stirling Road	Anglers Avenue	Broward County	Signalized	160/160
	29th Avenue	Broward County	Signalized	160/160
	I-95 NB and SB Ramp Terminals	Broward County	Signalized	160/160
	18th Avenue/ Oakwood Boulevard	Broward County	Signalized	160/160
	Compass Way	Broward County	Signalized	160/160
	Bryan Road	Broward County	Signalized	160/160
Griffin Road	Anglers Avenue	Broward County	Signalized	160/160
	I-95 SB NB and SB Ramp Terminals	Broward County	Signalized	Running Free
	Old Griffin Road	Broward County	Signalized	160/160

4.6 Simulation Duration

Both the AM and PM peak periods had a simulation duration of 4.5 hours. This duration allows congestion to build-up prior to the peak and dissipate after the peak-hour.

The simulation duration consisted of network loading (seed) time, followed by four hours of peak period demand volume. The peak-hour in terms of volume was the second hour of the simulation, which was followed by two shoulder (post-peak) hours. An overview of the simulation duration is as follows:

- Seed Time: 0 – 1,800 simulation seconds to load volume into the network (output not collected)
- Hour 1 – Pre-Peak Hour: 1,800 – 5,400 simulation seconds of shoulder peak-hour volume
- Hour 2 – Peak-Hour: 5,400 – 9,000 simulation seconds - peak-hour volume
- Hour 3 – Post-Peak Hour: 9,000 – 12,600 simulation seconds of shoulder peak-hour volume
- Hour 4 – Post Peak Hour: 12,600 – 16,200 simulation seconds of shoulder peak-hour volume

4.7 Measures of Effectiveness

Microsimulation provides numerical data to describe the operational performance of a scenario (in this case, the existing I-95 study area). Several measures of effectiveness (MOEs) are available for comparison purposes, such as delay time, travel time, speed, queue length, etc. VISSIM's numerical output must be defined by the user prior to running the simulation. Common data collection elements of VISSIM include travel time sections, node evaluations, data collection points, and queue counters. The simulation output provides an assessment of the various components of the transportation facility, which includes the following:

- Corridors/Routes - vehicle trips, travel time, speed.
- Interchange Ramps/Intersections - turning movement volume, delay time, queue length.
- Overall Network - vehicle trips, travel time, delay time.

The main output for the simulation analysis relates to the operation of the I-95 facility, including the mainline, ramp merge/diverge areas, weave segments, and ramp terminal intersections. The MOEs used to calibrate this project include the following:

- Travel Time Sections: Volume, speed, and density for the freeway mainline including basic, merge/diverge, and weave segments.
- Node Evaluation: Volume, delay, and max queue length for the study area intersections
- Network-wide Output: Total travel time, total delay time, vehicles processed, latent volume/demand, etc.

4.8 Required Number of Runs

VISSIM is a microscopic, discrete time-step, stochastic simulation model used to analyze a variety of transportation facilities and modes. The stochastic (random) nature of the simulation model means that the assigned vehicle types and driver types, route choice, and driving behavior attributes change based on the random seed values. Therefore, several simulation runs may be required to ensure that the mean values statistically represent the reported MOE. The following equation was used to determine the required number of simulation runs for the Existing Conditions models:

$$n = \left\{ \frac{t_{\alpha/2} \times \sigma}{E \times \mu} \right\}^2$$

Where:

n = Required number of simulation runs

$t_{\alpha/2}$ = Critical value of the t-distribution at confidence level (1-α)

σ = standard deviation of sample size

E = allowable percentage error (5-10%)

μ = mean value of sample size

An initial sample of 10 simulation runs was performed for each peak period. The total network delay time was evaluated to determine if 10 runs were sufficient to statistically represent the simulation output. Based on the sample of 10 simulation runs, a confidence level of 95%, and an allowable error of 10% (with a corresponding t-value of 1.833), the AM peak period required 9 runs and the PM peak period required 4 runs based on total delay time (**Table 6**). Therefore, the simulation results of the VISSIM models were based on the average output from the 10 simulation runs.

Table 6 - Required Number of Runs (Based on Total Delay Time)

Peak Period	μ (hours)	σ (hours)	# of Runs
AM	2125	277	9
PM	3087	257	4

5.0 CALIBRATION PROCESS

Simulation calibration is the process of performing model adjustments to better replicate the local driving behavior and traffic performance. The calibration process typically compares field data (volume, speed, travel time, congestion, etc.) to the simulation output. A model that is appropriately calibrated improves the model's ability to assess the future conditions of the study area. In this study, the calibration criteria from the FDOT Traffic Analysis Handbook (2021) was used as a guide, which is provided in **Table 7**. All reasonable efforts were made to calibrate the VISSIM models to the proposed calibration criteria and targets.

Table 7 - Freeway Model Calibration Criteria

Criteria and Measures	Calibration Acceptance Targets
Traffic Volume, Model Versus Observed	
Individual Link Flows	> 85% of cases
Within 15%, for 700 veh/h < Flow < 2700 veh/h	
Within 100 veh/h, for Flow < 700 veh/h	
Within 400 veh/h, for Flow > 2700 veh/h	
GEH Statistic < 5 for Individual Link Flows	> 85% of cases
Travel Time, Model Versus Observed	
Within 1 min, for Travel Time < 7 min	All cases
Within 15%, for Travel Time > 7 min	All cases
Speed, Model Versus Observed	
Within 10 mph of field-measured speeds	>85% of cases
Visual Audits	
Visually acceptable queueing	To analyst's satisfaction
Location of bottlenecks	To analyst's satisfaction
Lane utilization/choice	To analyst's satisfaction
No unrealistic vehicle behaviors	To analyst's satisfaction

Source: "Traffic Analysis Handbook: A Reference for Planning and Operations," FDOT, Systems Planning Office, 2021.

The formula for the GEH statistic is as follows:

$$GEH = \sqrt{\frac{(E-V)^2}{(E+V)/2}}$$

Where:

E = Model estimated volume
V = Field or input volume

5.1 VISSIM Calibration Parameters

The major VISSIM parameters used in the calibration process were primarily related to freeway facilities. These include car-following and lane change models, within the driving behavior parameter set. Three parameters exist for the Wiedemann 74 (arterial car-following model) while ten parameters exist for the Wiedemann 99 (freeway car-following model). It should be noted that the Headway Time parameter (CC1) has the largest impact on the facility capacity. Based on previous studies and research, such as *An Integrated Microscopic and Macroscopic Calibration for Psycho-Physical Car Following Models* by Sandeep, Sun, and Vortisch (2008), select car-following and lane change parameters were targeted for modifications. The calibration parameters were developed as part of an iterative process and the final calibration parameters, shown in **Table 8** through **Table 10**, were incorporated into both the AM and PM peak period models.

Table 8 – VISSIM Freeway Car-Following Calibration Parameters

Wiedemann 99 Model Parameters	Defaults	Basic Freeway	Merge / Diverge Freeway	Weave Freeway	Basic Express Lane	Merge/ Diverge Express Lane
CC0 (Standstill Distance) (ft)	4.92	4.92	4.92	4.92	4.92	4.92
CC1 (Headway Time) (s)	0.90	***1.15***	***1.15***	***1.15***	***1.15***	***1.15***
CC2 ('Following' Variation) (ft)	13.12	13.12	13.12	13.12	13.12	13.12
CC3 (Thresh. for Entering Following)	-8.00	-8.00	-8.00	-8.00	-8.00	-8.00
CC4 (Negative 'Following' Threshold)	-0.35	-0.35	-0.35	-0.35	-0.35	-0.35

The driving behavior parameters from the South of Hallandale Beach Boulevard to North of Hollywood Boulevard SIMR calibration effort (southern 3 interchanges in the PD&E study area) were used as a starting point for this calibration effort. The only driving behavior modification made was utilizing the slow recovery feature for the freeway link behavior types. Field observations as well as the iterative process of replicating the RITIS speed data supported that freeway vehicles were not immediately returning to their ideal desired speed within congested areas of the study area.

The AM peak period experienced congestion on I-95 in the northbound direction near the Sheridan Street on-ramp while the southbound direction experienced near free-flow conditions for the entire project area. In order to reasonably replicate observed congestion in the northbound direction, 10% of the peak hour I-95 mainline volume was added to hours 1 and 2. The resulting simulated volume at the mainline segment between Sheridan Street and Stirling Road, the segment downstream of slowest speeds (bottleneck) in the RITIS data, is within 5% of the project traffic count.

The PM peak period experienced congestion in the northbound direction due to queue spillback from the I-95 northbound to I-595 westbound ramp. A set of reduced speed areas were placed at the end of the I-595 off ramp link set to 10 mph for the simulation time of 3,600 seconds to 7,200 seconds. A project to relieve the I-595 congestion is currently under construction; therefore, the reduced speed areas will be removed in the future year scenarios. The southbound direction experienced congestion approximately between the I-595 overpass to the express lane ingress due to the I-595 major merge and high demand for the express lane facility. In order to reasonably replicate observed congestion in the southbound direction, between 2% and 9% of the peak hour I-95 mainline volume as well as the I-595 on ramp were added to hours 1 and 2. The resulting simulated volume at the mainline segment downstream of the bottleneck between the Stirling Road off ramp and Stirling Road on ramp, the segment downstream of slowest speeds in the RITIS data, is within 2% of the project traffic count.

Another element that significantly affects modeled driving behavior relates to the Lane Change Distance for connectors at diverge points, lane drops, and intersections. The default lane change distance when coding a connector in VISSIM is 656.2 feet. For freeway operations, this distance was found to be too short to provide the appropriate number of lane changes. To assist in the calibration of traffic operations for the existing conditions, the Lane Change Distance was increased to 2,500 feet per lane for freeway links. The one exception is the northbound off ramp to I-595 where a distribution of 2,500 feet to 3,200 feet per lane was applied to the off-ramp connector. The I-595 northbound off-ramp is a major diverge and appears on an information sign approximately 3 miles upstream. For merge points along the freeway (corresponding to the end of the acceleration lanes) the lane change distance was selected based on the length of the acceleration lane. For arterial connectors, 1,000 feet was assumed, and 'per lane' was applied to closely spaced intersections such as Sheridan Street at 29th Avenue and the I-95 ramp terminals (based on visual observations and engineering judgement).

5.2 Calibration Results

The calibration effort of this study primarily focused on replicating the travel time, speed, and volume data, as well as field observations that documented the existing traffic operational conditions along the I-95 corridor and arterials. Numerical results are represented in hourly intervals as well as total simulation time. The following sections discuss the calibration effort as it relates to the primary calibration criteria. **Appendix F** contains additional details on the calibration results.

5.2.1 Travel Time Data

To identify and quantify the operating conditions in terms of travel time, RITIS data was used to assist in the calibration process. Several days of RITIS speed data from October and November of 2021, Tuesday through Thursdays, were reviewed to identify typical speed conditions. Hour 2 was the primary focus when removing outlier days. Significant daily variation in congestion exists within the project area. However, major trends were identified for each peak period and the average speed of the selected days of RITIS data was used to identify the total travel time.

Table 11 and **Table 12** provide travel time comparisons between the average travel time of the selected days of RITIS data and the VISSIM output for both peak-hour periods and illustrate that the calibration parameters reasonably replicate the corridor travel times.

Table 11 – Travel Time Comparisons (AM Peak hour)

Direction	Total Distance (Miles)	Average Total Travel Time (mm:ss)	Target Range (mm:ss)		Simulated Average Travel Time (mm:ss)	Threshold Met?
			Lower Limit	Upper Limit		
I-95 Northbound (South of Sheridan Street to north of Griffin Road)	5.4	06:32	05:32	07:32	06:46	Yes
I-95 Southbound (North of Griffin Road to south of Sheridan Street)	5.4	05:13	04:13	06:13	05:22	Yes

For travel times longer than 7 minutes, acceptable calibration criteria is +/- 15%
For travel times shorter than 7 minutes, acceptable calibration criteria is +/- 1 minute

Table 12 – Travel Time Comparisons (PM Peak hour)

Direction	Total Distance (Miles)	Average Total Travel Time (mm:ss)	Target Range (mm:ss)		Simulated Average Travel Time (mm:ss)	Threshold Met?
			Lower Limit	Upper Limit		
I-95 Northbound (South of Sheridan Street to north of Griffin Road)	5.4	06:40	05:40	07:40	06:02	Yes
I-95 Southbound (North of Griffin Road to south of Sheridan Street)	5.4	07:15	06:10	08:20	06:55	Yes

For travel times longer than 7 minutes, acceptable calibration criteria is +/- 15%
For travel times shorter than 7 minutes, acceptable calibration criteria is +/- 1 minute

5.2.2 Speed Data

Similar to the travel time calibration, RITIS data was used to identify the existing operating conditions in terms of speed and compared to the model output. **Table 13** and **Table 14** provide comparisons at the critical I-95 mainline segments, primarily between the service interchange on and off-ramps, between the RITIS speed data and the VISSIM output for both peak-hour periods and represent the average speeds between the start and end points. The results show a close correlation between the average speeds in the field and the modeled average speeds, and the criteria for calibration is met for more than 85% of cases in each peak hour.

Figure 5 through **Figure 8** illustrate the significant daily variation in congestion within the project area and that the VISSIM output reasonably replicates congestion trends. The detailed speed data from RITIS is provided in **Appendix G**.

Table 13 – Speed Comparisons (AM Peak hour)

Segment		Average Speed (mph)	Target Range (mph)		Modeled Average Speed (mph)	Threshold Met?
From	To		Lower Limit	Upper Limit		
I-95 Northbound						
Hollywood Blvd On-Ramp	Sheridan St Off-Ramp	43	33	53	42	Yes
Sheridan St On-Ramp	Stirling Rd Off-Ramp	53	43	63	44	Yes
Stirling Rd On-Ramp	Griffin Rd Off-Ramp	58	48	68	53	Yes
Griffin Rd On-Ramp	I-595 Off-Ramp	58	48	68	57	Yes
I-95 Southbound						
Griffin Rd Off-Ramp	Griffin Rd On-Ramp	60	50	70	60	Yes
Griffin Rd On-Ramp	Stirling Rd Off-Ramp	62	52	72	56	Yes
Stirling Rd On-Ramp	Sheridan St Off-Ramp	62	52	72	61	Yes
Sheridan St On-Ramp	Hollywood Blvd Off-Ramp	63	53	73	61	Yes

Modeled average speeds must be within 10 mph for 85% of cases

Table 14 – Speed Comparisons (PM Peak hour)

Segment		Average Speed (mph)	Target Range (mph)		Modeled Average Speed (mph)	Threshold Met?
From	To		Lower Limit	Upper Limit		
I-95 Northbound						
Hollywood Blvd On-Ramp	Sheridan St Off-Ramp	57	47	67	60	Yes

5.2.3 Freeway Link Flow

Volume-based calibration was performed for individual link flows in terms of the separate simulation hours 1-4, as well as for the entire four-hour peak period. The calibrated model meets the acceptable criteria in terms of both the individual hours and the overall simulation period.

For individual link flows, the four hours of each peak period were evaluated separately and in terms of the overall four-hour period. **Table 15** presents the overall percent compliance for individual link flows throughout the network. It should be noted that (as discussed in **Table 7**) different criteria for compliance are used based on the link's demand volume. The calibration for individual link flows includes freeway mainline segments at the northern and southern ends of the network and segments between each interchange. Based on the simulation output, 100% of the links in all 4 hours of the AM peak period met the individual link criteria. Hours 1, 3, and 4 of the PM peak period met the individual link criteria for 100% of links while Hour 2 met for 94%. Therefore, both the AM and PM peak period meet the calibration target of 85% of cases for each hour.

Table 15 – Individual Link Flows

Peak	Hour	Percent Compliant
AM	1	100%
	2	100%
	3	100%
	4	100%
	Total	**100%**
PM	1	100%
	2	94%
	3	100%
	4	100%
	Total	**100%**

The Geoffrey E. Havers (GEH) statistic is a formula used to compare two sets of traffic volumes. A GEH value of less than 5 is considered a good match between the hourly input volumes and the modeled volumes. Based on the simulation output, the individual hours and total simulation period for both the AM and PM peak periods had GEH compliant percentages of 100% (**Table 16**).

Table 16 – GEH < 5 for Individual Link Flows

Peak	Hour	Percent Compliant
AM	1	100%
	2	100%
	3	100%
	4	100%
	Total	**100%**
PM	1	100%
	2	100%
	3	100%
	4	100%
	Total	**100%**

In addition to the individual link flow comparisons, the simulated throughput was compared with the peak hour project traffic volume on I-95 at the two bottleneck locations in the northbound direction and one bottleneck location in the southbound direction. **Table 17** shows a comparison of the project traffic volume to the simulated throughput during the AM and PM peak hours. The AM peak showed volume differences ranging from 0.1% to 5%, while the PM peak showed volume differences ranging from -0.03% to 1.3%. These results indicate a close correlation between the existing hourly capacity of I-95 in the study area and the capacity of the models.

Table 17 – Peak Hour Capacity Comparison

Count Location	Hourly Data	AM Peak Hour	PM Peak Hour
I-95 Northbound (Between Sheridan St on ramp and Stirling Rd off ramp)	Project Traffic Volume	8,190	7,680
	Simulation Throughput	8,528	7,678
	% Difference	**4.1%**	**-0.03%**
I-95 Northbound (Between Griffin Rd on ramp and I-595 off ramp)	Project Traffic Volume	9,180	8,820
	Simulation Throughput	9,639	8,866
	% Difference	**5.0%**	**0.5%**
I-95 Southbound (Between Griffin Rd on ramp and Stirling Rd off ramp)	Project Traffic Volume	9,300	9,300
	Simulation Throughput	9,307	9,421
	% Difference	**0.1%**	**1.3%**

5.2.4 Arterial Link Flow

Arterial peak hour link volumes were compared between study intersections in both the eastbound and westbound direction. The simulated volume of each segment was compared to the demand volume. The majority of AM peak hour segments simulated volumes are within 2% or less of the demand volumes with a total range of -5% to 2% (**Table 18**). In both directions of travel, 100% of the segments meet the applicable link flow criteria, being within 100 vehicles per hour for volumes less than 700 vehicles per hour or being within 15% of the demand volume for volumes greater than 700 vehicles per hour but less than 2,700 vehicles per hour.

All PM peak hour segments simulated volumes are within 3% or less of the demand volumes (**Table 19).** In both directions of travel, 100% of the segments meet the applicable link flow criteria, being within 100 vehicles per hour for volumes less than 700 vehicles per hour or being within 15% of the demand volume for volumes greater than 700 vehicles per hour but less than 2,700 vehicles per hour.

In addition to the segment evaluation described above, a comparison between the demand and simulated volumes is provided on a per-movement basis in the intersection analysis results provided in **Appendix H**. These results also show a close correlation between the demand and simulated volumes.

Table 18 – AM Peak Hour Arterial Link Volume Comparison

5.2.5 Visual Audits (Bottlenecks)

Review of the RITIS speed data revealed that there is significant daily variation in congestion within the project area. However, major trends were identified for each peak period and the average of the selected days was used for the travel time and speed calibration targets.

The AM peak period experienced congestion on I-95 in the northbound direction near the Sheridan Street on-ramp while the southbound direction experienced near free-flow conditions for the entire project area. The PM peak period experienced congestion in the northbound direction due to queue spillback from the I-95 northbound to I-595 westbound ramp. The southbound direction experienced congestion approximately between the I-595 overpass to the express lane ingress due to the I-595 major merge and high demand for the express lane facility.

Based on these visual audits and review of the animation in VISSIM, the AM and PM peak period simulation models capture the trends and bottlenecks within the study area. No residual congestion or queues were evident during either peak period.

6.0 CONCLUSIONS

This report documented the VISSIM simulation model development and calibration effort for the 2021 existing year AM and PM peak periods, which will serve as the basis for the future conditions analysis. The calibration effort produced simulation output that replicated volume, travel time/speed, and bottlenecks to a reasonable level for both the AM and PM peak periods and is appropriate for use in the development of the future conditions models.

VISSIM Existing Conditions Model Development and Calibration Report

State Road Number: SR 9 Co./Sec./Sub. : Broward Project MP:

Item to Check	Description	Check
Model errors	Simulation model contains no errors	✓
	Simulation model was accurately verified	✓
MOEs	All calibration MOEs are listed	✓
	Calibration targets/goals have been outlined	✓
	Calibration and validation data is sufficient to meet the targets	✓
	Calibration areas are clearly identified	✓
Calibration process	Calibration process is documented with all relevant calibration data, assumptions, and include a history of base model development	✓
	Calibration effort cover both AM and PM peak periods	✓
	Default calibration parameters were changed and documented	✓
	Model animation matches expected driver behavior and conditions observed in the field	✓
	Model replicates real-world bottleneck(s) and lane utilization	✓
Calibration targets	Calibration results are based on at least 10 simulation runs with different random seeds	✓
	Model output volumes satisfy volume calibration requirements	✓
	Model link capacities satisfy capacity calibration requirements	✓
	Model link speeds meet speed calibration requirements	✓
	Model link travel time meet calibration requirements	✓
	Model intersection delay results meet calibration requirements	N/A
	Model queuing replicates real-world conditions	✓
	Calibrated model is validated with an independent data set	✓

Comments:

The calibration process included model adjustments to better replicate the local driving behavior and traffic performance. An origin destination (O-D) matrix was established during the project volume development phase to provide more realistic travel patterns and lane changing behaviors for the operational analysis. Several typical model calibration targets were identified for this project (volume, travel time, congestion, etc.). Adjustments to select car-following and lane changing parameters in VISSIM were evaluated for both AM and PM peak models to produce simulation output that reasonably replicated the volume, travel time/speed, and bottlenecks within the study area. After numerous iterations, a unified set of calibration parameters was selected to create a valid model to perform the future conditions analyses.

INTRODUCTION

Two major railroad corridors serve the Southeast Florida Region – the Florida East Coast (FEC) Railroad and the South Florida Rail Corridor (SFRC)/CSX corridor. Both corridors operate within urban areas of the region, resulting in many at-grade crossings with the roadway network. At-grade crossings pose delays to traffic operations while also presenting challenges for freight and passenger rail operations.

The Florida Department of Transportation (FDOT) District Four has established an on-going at-grade rail crossing delay program to evaluate the impact of the SFRC/CSX and the FEC Railroad corridors on the surrounding roadway network. FDOT has been collecting video data since 2006, expanding the program to include both state highway and local arterial crossings from Miami-Dade County to Indian River County. Queue length and vehicle delay data have been analyzed to identify recommendations for minor improvements to enhance recovery to normal traffic conditions.

The objective for the railroad crossing delay program for the year 2016 is to analyze eighteen (18) intersections along the Broward County and Palm Beach County segment of the SFRC/CSX corridor, and seven (7) intersections along the FEC in Palm Beach, Martin, St. Lucie, and Indian River Counties. An ancillary objective includes the collection of 72 hours of video along the FEC corridor.

FLORIDA EAST COAST RAILWAY (FEC) CORRIDOR

The FEC is an active Class II regional railroad operating through urban core areas along the southeast coast of Florida. Currently the FEC is a freight corridor exclusively used by the Florida East Coast Industries (FECI), a Class II freight railroad. The Brightline, a high-speed inter-city passenger rail service, is expected to begin operations in the second half of 2017. The analysis included the following FEC at-grade crossings:

1. 272390P - SR 708/Blue Heron Boulevard (Palm Beach County)
2. 272377B - SR 706/Indiantown Road (Palm Beach County)
3. 272353M - SR 714/Monterey Road (Martin County)
4. 272867T - A1A/Seaway Drive (St. Lucie County)
5. 272958Y - SR A1A/N Causeway (St. Lucie County)
6. 282958Y - SR 60/19 Place (Indian River County)
7. 272193B - SR 60/20 Street (Indian River County)

A map of the crossing locations is provided in Figure 1.

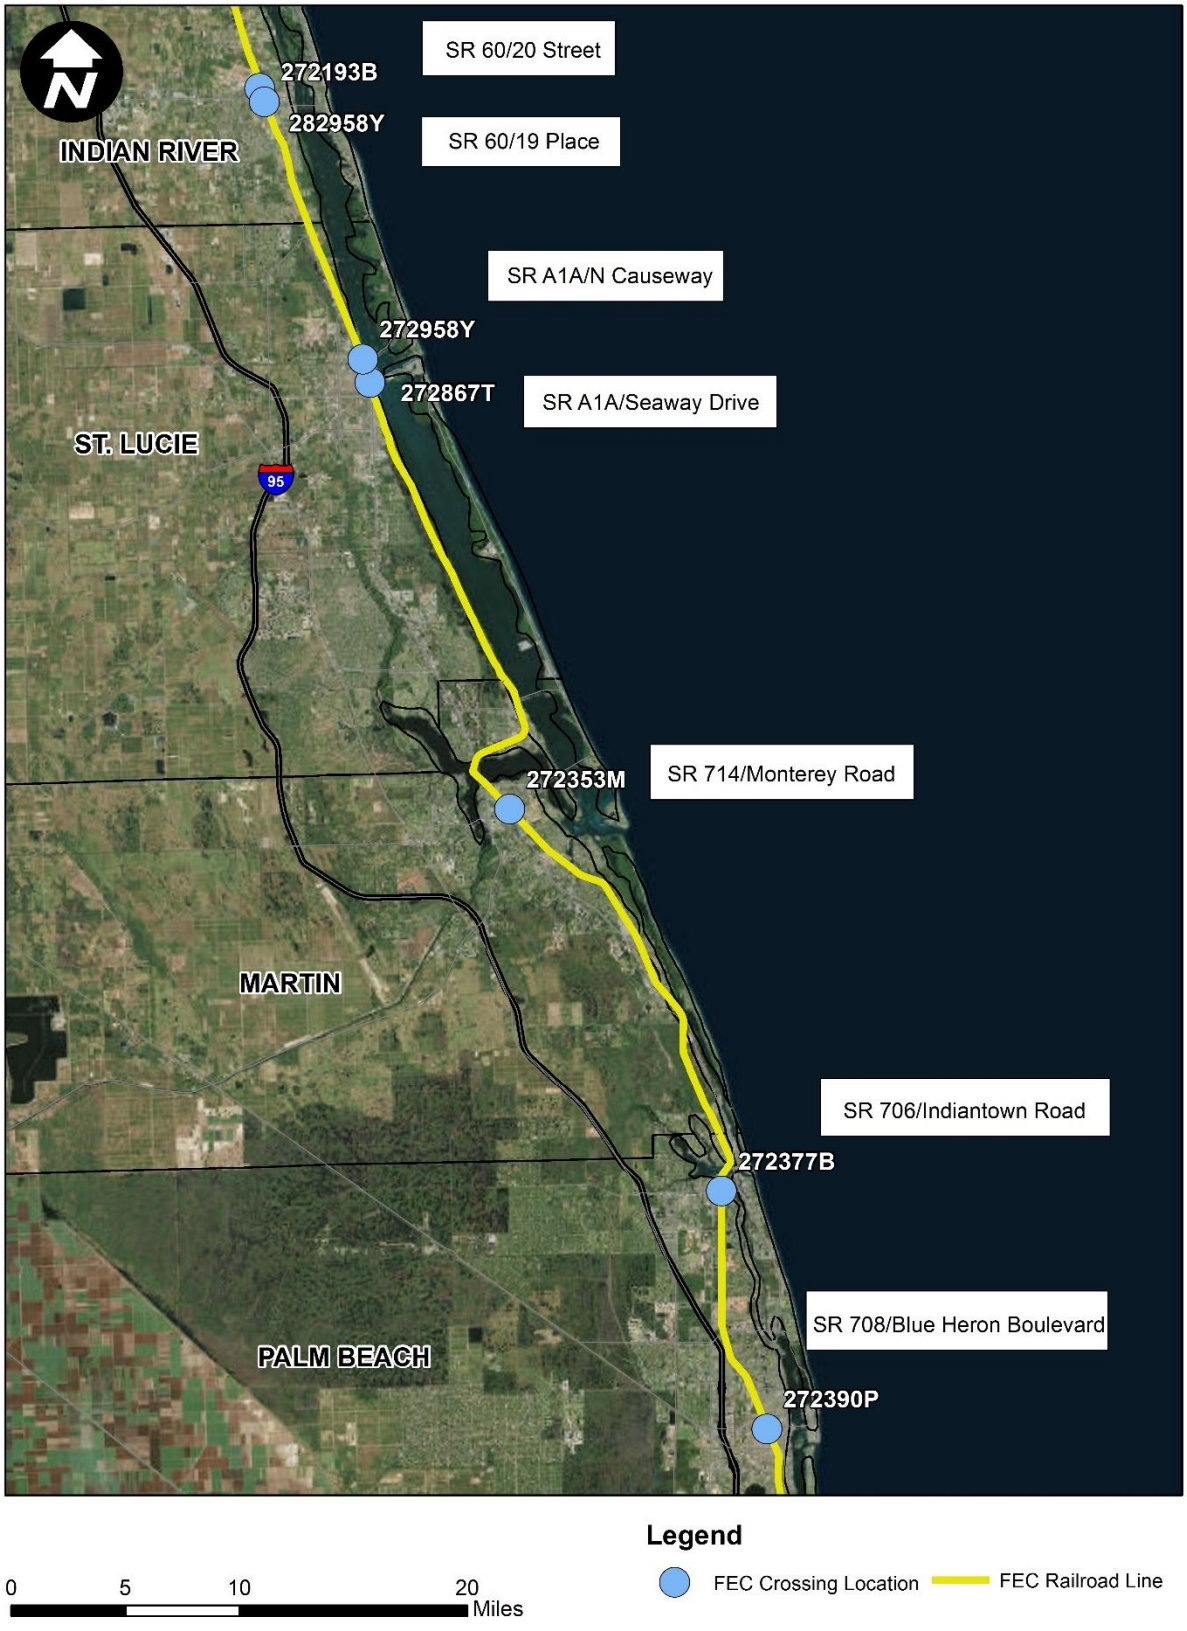

Figure 1: FEC Crossing Study Locations

DATA COLLECTION

Videos of the eastbound and westbound approaches to the crossings were recorded using portable video cameras mounted near the railroad crossing. A video recording of the corridor at each crossing was also taken to supplement the eastbound/westbound approach videos in determining times and duration of the train crossing, as well as to provide detailed information as to the type and direction of the train.

Data were collected for periods of 48 or more continuous hours on four separate occasions.

- Monday, May 23, 2016 – Wednesday, May 25, 2016
- Wednesday, June 22, 2016 – Thursday, June 23, 2016
- Wednesday, July 6, 2016 – Thursday, July 7, 2016
- Tuesday, August 9, 2016 – Thursday, August 11, 2016

Videos were reviewed for clarity and view of the intended approach (east/west/corridor). Only times for which an approach video and the corridor video provided consistent time periods were used for analysis since the railroad crossing gates were often not visible from the approach videos.

DATA ANALYSIS

Average delay per vehicle at each intersection was calculated by recording the delay (in seconds) of the first, median, and last vehicle in the queue. The following equation was used:

$$Delay_{Total} = \frac{\#\ of\ Veh}{2} \times \left[\left(\frac{Delay_1 + Delay_M}{2}\right) + \left(\frac{Delay_M + Delay_L}{2}\right)\right] \times \frac{1\ min}{60\ sec}$$

Where,

$Delay_{Total}$	Total delay due to gate closing event, reported in vehicle-minutes,
$\#\ of\ Veh$	Number of vehicles queued at approach,
$Delay_1$	Delay, in seconds, experienced by the first vehicle in the queue,
$Delay_M$	Delay, in seconds, experienced by the median vehicle in the queue, and
$Delay_L$	Delay, in seconds, experienced by the last vehicle in the queue.

Table 1 summarizes the FEC data analyzed.

RESULTS

The FEC railroad corridor is characterized by trains transporting bulk and intermodal freight. Freight trains typically are longer in length than passenger trains, resulting in longer railroad crossing durations. Another factor that impacts delay is the volume of vehicles on the road at the time of crossing. For this reason, a majority of the activity along the FEC railroad corridors occurs between the hours of 6 P.M. and 8 A.M., when traffic volumes are typically lower. Few trains operate along the FEC during peak traffic hours (7-9 A.M. and 4-6 P.M.) to limit the impacts of railroad crossing on the roadway network.

Table 2 to Table 6 provide a summary of the railroad crossing delay analyses for the selected FEC at-grade crossings. Raw data for each crossing is provided, by approach, in **Appendix A**.

Table 2: Duration of Gate Closing Events (FEC)

Roadway Crossing Location	County	Total Hours Analyzed[1]	Number of Gate Closing Events Analyzed	Minimum Crossing Duration (min:sec)	Median Crossing Duration (min:sec)	Maximum Crossing Duration (min:sec)
SR 708/Blue Heron Boulevard (EB)	Palm Beach	47	50	0:09	2:49	4:38
SR 708/Blue Heron Boulevard (WB)	Palm Beach	48	51	0:09	2:54	4:38
SR 706/Indiantown Road (EB)	Palm Beach	60	37	0:30	3:30	6:45
SR 706/Indiantown Road (WB)	Palm Beach	28.5	18	0:36	2:49	4:34
SR 714/Monterey Road (EB)	Martin	54.5	37	0:38	3:23	12:23
SR 714/Monterey Road (WB)	Martin	77.5	56	0:38	3:32	12:23
SR A1A/Seaway Drive (WB)	St. Lucie	64.5	38	0:30	3:09	7:56
SR A1A/N Causeway (EB)	St. Lucie	27.5	15	1:30	2:50	5:25
SR A1A/N Causeway (WB)	St. Lucie	71.5	45	0:09	2:43	12:54
SR 60/19 Place (EB)	Indian River	72	47	0:21	2:28	4:23
SR 60/20 Street (WB)	Indian River	48	34	0:18	2:26	4:28

Note: [1] Hours analyzed vary by intersection and approach direction based on quality and availability of video data.

Median gate crossing duration was fairly consistent along the FEC corridor ranging from a high of 3 minutes and 32 seconds at SR 714/Monterey Road in Martin County, and a low of 2 minutes 26 seconds at SR 60/20 Street in Indian River County. Wide ranges in minimum and maximum crossing duration were observed and are often due to infrequent events.

Table 3: Queue Length Due to Gate Closing Events (FEC)

Roadway Crossing Location	County	Number of Gate Closing Events Analyzed	Minimum Queue (vehicles)	Median Queue (vehicles)	Maximum Queue[1] (vehicles)
SR 708/Blue Heron Boulevard (EB)	Palm Beach	50	0	12	34
SR 708/Blue Heron Boulevard (WB)	Palm Beach	51	0	20	50
SR 706/Indiantown Road (EB)	Palm Beach	37	0	14	60
SR 706/Indiantown Road (WB)	Palm Beach	18	0	4	36
SR 714/Monterey Road (EB)	Martin	37	0	12	58
SR 714/Monterey Road (WB)	Martin	56	0	8	56
SR A1A/Seaway Drive (WB)	St. Lucie	38	0	6	27
SR A1A/N Causeway (EB)	St. Lucie	15	0	2	9
SR A1A/N Causeway (WB)	St. Lucie	45	0	2	31
SR 60/19 Place (EB)	Indian River	47	0	4	34
SR 60/20 Street (WB)	Indian River	34	0	6	50

Note: [1] Due to visibility limitations, actual queue may exceed maximum queue reported.

As shown in **Table 3**, SR 708/Blue Heron Boulevard in Palm Beach County experiences the longest median queue, with 20 vehicles queued in the westbound direction in the median condition. Maximum queue length was limited to visibility of the video data; therefore, actual maximum queue length may exceed reported maximum queue.

SR A1A/North Causeway in St. Lucie County had the shortest queues, with a median queue length of two (2) vehicles for both eastbound and westbound directions, and a maximum queue length of nine (9) vehicles in the eastbound direction.

Table 4: Vehicle Delay Due to Gate Closing Events (FEC)

Roadway Crossing Location	County	Number of Gate Closing Events Analyzed	Minimum Delay (veh-min)	Median Delay (veh-min)	Maximum Delay (veh-min)	Average Total Delay per 24-hour Period[1] (veh-min)
SR 708/Blue Heron Boulevard (EB)	Palm Beach	50	0.00	15.28	317.10	935.97
SR 708/Blue Heron Boulevard (WB)	Palm Beach	51	0.00	24.58	276.25	1,175.47
SR 706/Indiantown Road (EB)	Palm Beach	37	0.00	14.35	179.80	618.38
SR 706/Indiantown Road (WB)	Palm Beach	18	0.00	9.80	77.70	331.01
SR 714/Monterey Road (EB)	Martin	37	0.00	21.46	174.38	804.27
SR 714/Monterey Road (WB)	Martin	56	0.00	12.46	208.37	592.83
SR A1A/Seaway Drive (WB)	St. Lucie	38	0.00	3.06	113.63	170.51
SR A1A/N Causeway (EB)	St. Lucie	15	0.00	1.70	30.64	74.33
SR A1A/N Causeway (WB)	St. Lucie	45	0.00	1.63	89.64	119.80
SR 60/19 Place (EB)	Indian River	47	0.00	3.94	117.58	247.38
SR 60/20 Street (WB)	Indian River	34	0.00	3.23	69.79	183.74

Note: [1] For each intersection, the sum total delay was divided by the number of hours analyzed, and multiplied by 24 hours per day in order to calculate an average total delay over a 24-hour period.

Video data that were collected for each corridor and approach varied in duration and quality. As a result, all intersections have a different number of events that were analyzed. Total delay for each approach was normalized to provide a daily average total delay, a metric that allows the comparison of all intersections. Table 4 provides a summary of the findings. SR 708/Blue Heron Boulevard in Palm Beach County had the highest average total delay per day with 936 vehicle-minutes of delay for the eastbound approach, and 1,175 vehicle-minutes of delay for the westbound approach. SR A1A/North Causeway in St. Lucie County experienced the lowest average total delay, with 74 and 120 vehicle-minutes of delay for the eastbound and westbound approaches, respectively.

A peak-hour analysis was also conducted for comparative purposes. For each crossing, the hour with the highest total delay was analyzed.

Table 5: Total Peak Hour Vehicle Delay (FEC)

Roadway Crossing Location	County	Peak Hour Period (Time)	Number of Peak Hour Gate Closing Events	Total Duration of Gate Closures (min:sec)	Total Vehicles Stopped (vehicles)	Total Delay in Peak Hour (veh-min)
SR 708/Blue Heron Boulevard (EB)	Palm Beach	7:00 - 8:00	6	23:38	97	406.65
SR 708/Blue Heron Boulevard (WB)	Palm Beach	7:00 - 8:00	6	23:38	166	499.25
SR 706/Indiantown Road (EB)	Palm Beach	7:15 - 8:15	2	04:20	112	217.28
SR 706/Indiantown Road (WB)	Palm Beach	6:15 - 7:15	3	08:35	53	146.46
SR 714/Monterey Road (EB)	Martin	7:00 - 8:00	2	07:57	98	267.19
SR 714/Monterey Road (WB)	Martin	10:45 - 11:45	2	06:36	81	244.89
SR A1A/Seaway Drive (WB)	St. Lucie	7:30 - 8:30	3	14:19	57	151.48
SR A1A/N Causeway (EB)	St. Lucie	7:30 - 8:30	2	08:15	12	35.75
SR A1A/N Causeway (WB)	St. Lucie	7:30 - 8:30	2	08:15	44	107.41
SR 60/19 Place (EB)	Indian River	7:30 - 8:30	1	04:43	34	117.58
SR 60/20 Street (WB)	Indian River	17:00 - 18:00	3	06:42	78	100.67

The peak-hour was determined as the hour with the greatest amount of delay. Typical peak-hour conditions occurred between the hours 7:00 A.M. and 9:00 A.M., coinciding with morning peak traffic periods. Eastbound and westbound approaches often differed significantly in total delay during the peak hour. As expected, SR 708/Blue Heron Boulevard in Palm Beach County experiences the greatest peak-hour delay, twice that experienced by any other intersection.

SR 60 (19 Place and 20 Street) provide an example of how traffic patterns affect delay experienced at the railroad crossing. In the eastbound direction (19 Place), the peak-hour is in the morning, when commuters are headed towards downtown Vero Beach. The reverse is true for 20 Street (westbound approach), where the peak-hour was identified between 5:00 P.M. and 6:00 P.M., reflecting traffic patterns as people leave work downtown to return home.

An analysis was also conducted to evaluate vehicle delay as it relates to type of gate closing event. Corridor videos were used to classify gate closing events into five types: passenger, freight-bulk, freight-intermodal, no train events. Passenger trains currently do not operate within the FEC corridor, and therefore there are no such events were recorded. Events where a maintenance vehicle or maintenance equipment crossed were classified as "maintenance." Events where a locomotive was making a deadhead movement (one or two locomotives with few, empty cars) were classified as "other". Gate closing events where no vehicle was observed along the FEC corridor were classified as "no train" events.

Table 6: Average Vehicle-Delay by Gate Closing Event Type (FEC)

Crossing	Freight-bulk		Freight-intermodal		Maintenance/ Other		No Train		Total	
	Ave. Delay[1] (veh-min)	Count[2]	Ave. Delay[1] (veh-min)	Count[2]	Ave. Delay[1] (veh-min)	Count[2]	Ave. Delay[1] (veh-min)	Count[2]	Ave. Delay[1] (veh-min)	Count[2]
SR 708/Blue Heron Boulevard	40.4	20	46.3	34	24.6	20	48.5	27	41.4	101
SR 706/Indiantown Road	38.5	15	37.4	36	3.7	4			35.3	55
SR 714/Monterey Road	43.2	41	40.2	46	19.5	6			40.2	93
SR A1A/Seaway Drive	10.5	15	13.4	19	11.8	4			12.1	38
SR A1A/N Causeway	5.2	23	9.7	31	6.6	4	0.0	2	7.4	60
SR 60/19 Place	19.1	22	13.2	23	11.5	2			15.9	47
SR 60/20 Street	15.3	14	8.1	16	22.9	1	0.1	1	11.5	32

Note: [1] Average delay is calculated on a per-intersection basis, not by approach.
[2] "Count" represents the sum of all eastbound and westbound events for each crossing.

As shown below in Table 6, the type of train had minimal impact on the delay. Freight-bulk and freight-intermodal trains on average resulted in similar average vehicle delays, varying by seven (7) vehicle-minutes or less. Gate closing events related to maintenance vehicles or other vehicles resulted in significantly less delay than the freight events, likely as a result of shorter gate closing times required by the maintenance vehicle. Overall, the number of vehicles stopped at a gate closing event had a bigger impact on delay than the type and length of the train.

SR 708/Blue Heron Boulevard in Palm Beach County has a high number of "no train" events, the majority of which occurred consecutively as a result of a locomotive shunting along the side track and siding located to the south of the crossing. This activity caused gate activation for extended periods of time, resulting in the high average delay reported. However, this activity was rarely observed at the other crossing locations.

COMPARISON TO PRIOR YEARS

One of the goals for the Railroad Crossing Delay Program is the historic evaluation of median vehicle delay to identify trends for at-grade crossings over time. Three of the FEC railroad crossings were studied in 2006, 2009, 2011, 2012, 2013, and 2014. Four of the crossings (SR 706/Indiantown Road, SR 714/Monterey Road, SR A1A/Seaway Drive, and SR 60/19 Place) are being studied for the first time; therefore, no delay information is available for previous years. The data available for previous years were only collected between 6:00 A.M. and 8:00 P.M. For comparison to prior years only, 2016 gate closing events that occurred within this specified 14-hour period were analyzed to be consistent with prior years. However, it should be noted that the 2016 events included are not from a continuous 14-hour period, and may not be truly representative of the analysis period as data that were collected may be more heavily weighted towards certain periods of the day that have more (or less) delay per gate closing.

Table 7 summarizes the median vehicle delay for each crossing. For crossings where two approaches were studied, the higher median delay (peak direction) is reported.

Table 7: Summary of Median Peak Direction Vehicle Delay Per Gate Closing (FEC)

Roadway Crossing Location	County	Median Vehicle Delay per Gate Crossing (veh-min) *(6:00 A.M. to 8:00 P.M.)*						
		2006	2009	2011	2012	2013	2014	2016[1]
SR 708/Blue Heron Boulevard[2]	Palm Beach	74	61	69	21	84	66	45
SR 706/Indiantown Road[2]	Palm Beach	No Data Collected						81
SR 714/Monterey Road[2]	Martin	No Data Collected						114
SR A1A/Seaway Drive	St. Lucie	No Data Collected						18
SR A1A/N Causeway[2]	St. Lucie	18	20	17	38	12	24	9
SR 60/19 Place	Indian River	No Data Collected						9
SR 60/20 Street	Indian River	26	22	22	67	11	30	19

Note: [1] Only crossings that occurred between the hours of 6:00 A.M. and 8:00 P.M. were used for consistency.
[2] Median Delay is provided for peak direction (approach).

Median vehicle delay seems to have decreased in 2016 compared to historic values. Intersections experienced a reduction in delay ranging from 11 to 21 vehicle-minutes.

It should be noted that the vehicle-delay data were recorded throughout different times of the year, and was not adjusted using a seasonal factor. Therefore, comparison between various years may be affected if data is recorded during a peak or an off-peak time of year.

FEC GATE FREQUENCY OF GATE CLOSURE ANALYSIS

The frequency of trains on the FEC Corridor was analyzed to estimate the change over time in train traffic. The frequency of trains was estimated for prior years by analyzing the number of gate closing events.

The results show that it is likely the number of freight trains on the FEC Corridor has approximately doubled during the five-year period between 2011 and 2016. However, it is difficult to be certain because of differences in data collection methodologies between 2016 and the previous years. The primary difference is the collection of 24-hour data instead of 12- or 14-hour data as in previous years. FEC

freight trains tend to operate more frequently at night, which was not studied until 2016 due to the minimal impact on total vehicle delay.

Therefore, the study team analyzed the average number of 2016 gate closing events between 6:00 AM and 8:00 PM only, which matches the study period from 2012-2014. The analysis shows that there has been an increase from approximately 0.25 gate closing events per hour studied to approximately 0.50 gate closing events per hour studied during this 14-hour period. This would suggest a doubling of freight train traffic during the five-year period. These ratios equate to an increase from one train every four hours to one train every two hours during the five-year study period between 2011 and 2016.

Table 8 presents an estimate of the frequency of freight trains in the FEC Corridor by analyzing the frequency of gate closing events over the past five years of data collection. The analysis shows that there has been a general increase in the frequency of gate closing events per hour analyzed between 2011 and 2016 that ranges from a 50% increase at SR 708/Blue Heron Boulevard to a 100% increase at SR 60/20 Street to a more than 200% increase at SR A1A/N Causeway. It is likely that the higher frequency of gate closure event data at SR 708/Blue Heron Boulevard is impacted by "no train" events due to switching operations near the Port of Palm Beach. Therefore, the data at SR 60/20 Street and SR A1A/N Causeway may be more indicative of typical mainline rail operations, which would indicate at least a doubling of freight train frequency on the FEC Corridor during the period studied.

Table 8: Summary of Frequency of Gate Closure Analysis Over a 5-Year Period

Roadway Crossing Location	County	Gate Closing Events Per Hour Analyzed *(6:00 A.M. to 8:00 P.M.)*						
		2006	2009	2011	2012	2013	2014	2016[1]
SR 708/Blue Heron Boulevard	Palm Beach	N/A	N/A	0.67	1.43	0.64	0.64	1.00
SR 706/Indiantown Road	Palm Beach	No Data Collected						0.67
SR 714/Monterey Road	Martin	No Data Collected						0.85
SR A1A/Seaway Drive	St. Lucie	No Data Collected						0.44
SR A1A/N Causeway	St. Lucie	N/A	N/A	0.17	0.21	0.43	0.43	0.57
SR 60/19 Place	Indian River	No Data Collected						0.50
SR 60/20 Street	Indian River	N/A	N/A	0.25	0.21	0.50	0.50	0.50

Note: [1] For 2016, only gate closing events between 6:00 AM and 8:00 PM were analyzed for this table to be consistent with the data collection periods from prior years.

SUMMARY

A total of seven (7) at-grade crossings were evaluated along the FEC corridor between Palm Beach County and Indian River County. SR 708/Blue Heron Boulevard experienced the highest average vehicle delay per crossing event, averaging 41.4 vehicle-minutes per gate closure. SR 708/Blue Heron Boulevard also had the highest peak-hour vehicle delay, ranging between 407 and 499 vehicle-minutes of delay for the eastbound and westbound approaches, respectively.

When analyzing typical traffic hours (6:00 A.M. to 8:00 P.M.), SR 714/Monterey Road had the highest median duration of gate closing event and SR 708/Blue Heron Boulevard had the highest median delay.

SOUTH FLORIDA RAIL CORRIDOR (SFRC)/CSX

CSX is the only Class I railroad that operates within the state of Florida. The South Florida Rail Corridor (SFRC) is the segment of the CSX railroad that operates within Palm Beach, Broward, and Miami-Dade Counties. The corridor serves primarily passenger rail (Tri-Rail, which serves 18 stations between Mangonia Park in Palm Beach County and the Miami Intermodal Center [MIC] in Miami-Dade County, and Amtrak, which serves a smaller number of the passenger rail stations than Tri-Rail). The corridor connects the region's three international airports: Palm Beach International Airport (PBI), Fort Lauderdale-Hollywood International Airport (FLL), and Miami International Airport (MIA). Tri-Rail operations account for 50 trains per day. The SFRC is owned by FDOT, and is operated by the South Florida Regional Transportation Authority (SFRTA). A few freight trains per day are operated by CSX on the SFRC. The at-grade crossings that were analyzed along the SFRC/CSX corridor include:

1. 628281A – SR 820/Hollywood Boulevard (Broward County)
2. 628280T – Johnson Street (Broward County)
3. 628279Y – Taft Street (Broward County)
4. 937440G – Gulf Stream Way (Broward County)
5. 628272B – SR 818/Griffin Road (Broward County)
6. 628186E – SR 870/Commercial Boulevard (Broward County)
7. 628183J – Cypress Creek Road (Broward County)
8. 621538J – NW 33 Street (Broward County)
9. 628168G – SR 834/Sample Road (Broward County)
10. 628167A – SR 810/Hillsboro Boulevard (Broward County)
11. 628163X – SR 794/Yamato Road (Palm Beach County)
12. 628159H – SW 10 Street (Palm Beach County)
13. 628155F – SR 806/Atlantic Avenue (Palm Beach County)
14. 628146G – 6 Avenue South (Palm Beach County)
15. 628144T – SR 802/Lake Worth Road (Palm Beach County)
16. 628126V – SR 704/Okeechobee Boulevard (Palm Beach County)
17. 628120E – Banyan Boulevard (Palm Beach County)
18. 628102G – Australian Avenue (Palm Beach County)

DATA COLLECTION

Videos of approaches to the railroad crossings were recorded using portable video cameras mounted along the corridor. A video recording of the corridor near each crossing was also taken to supplement the approach videos in determining times and duration of gate closing events, as well as to provide the type and direction of the train. Data were collected for a minimum of 24-hour periods. Data collection occurred on the following days:

- Thursday, May 12, 2016 – Friday, May 13, 2016
- Tuesday, May 24, 2016 – Thursday, May 26, 2016
- Thursday, June 2, 2016
- Tuesday, June 7, 2016 – Wednesday, June 8, 2016
- Thursday, July 14, 2016
- Monday, July 18, 2016 – Tuesday, July 19, 2016

A map of the crossing locations along the SFRC/CSX corridor is provided in Figure 2.

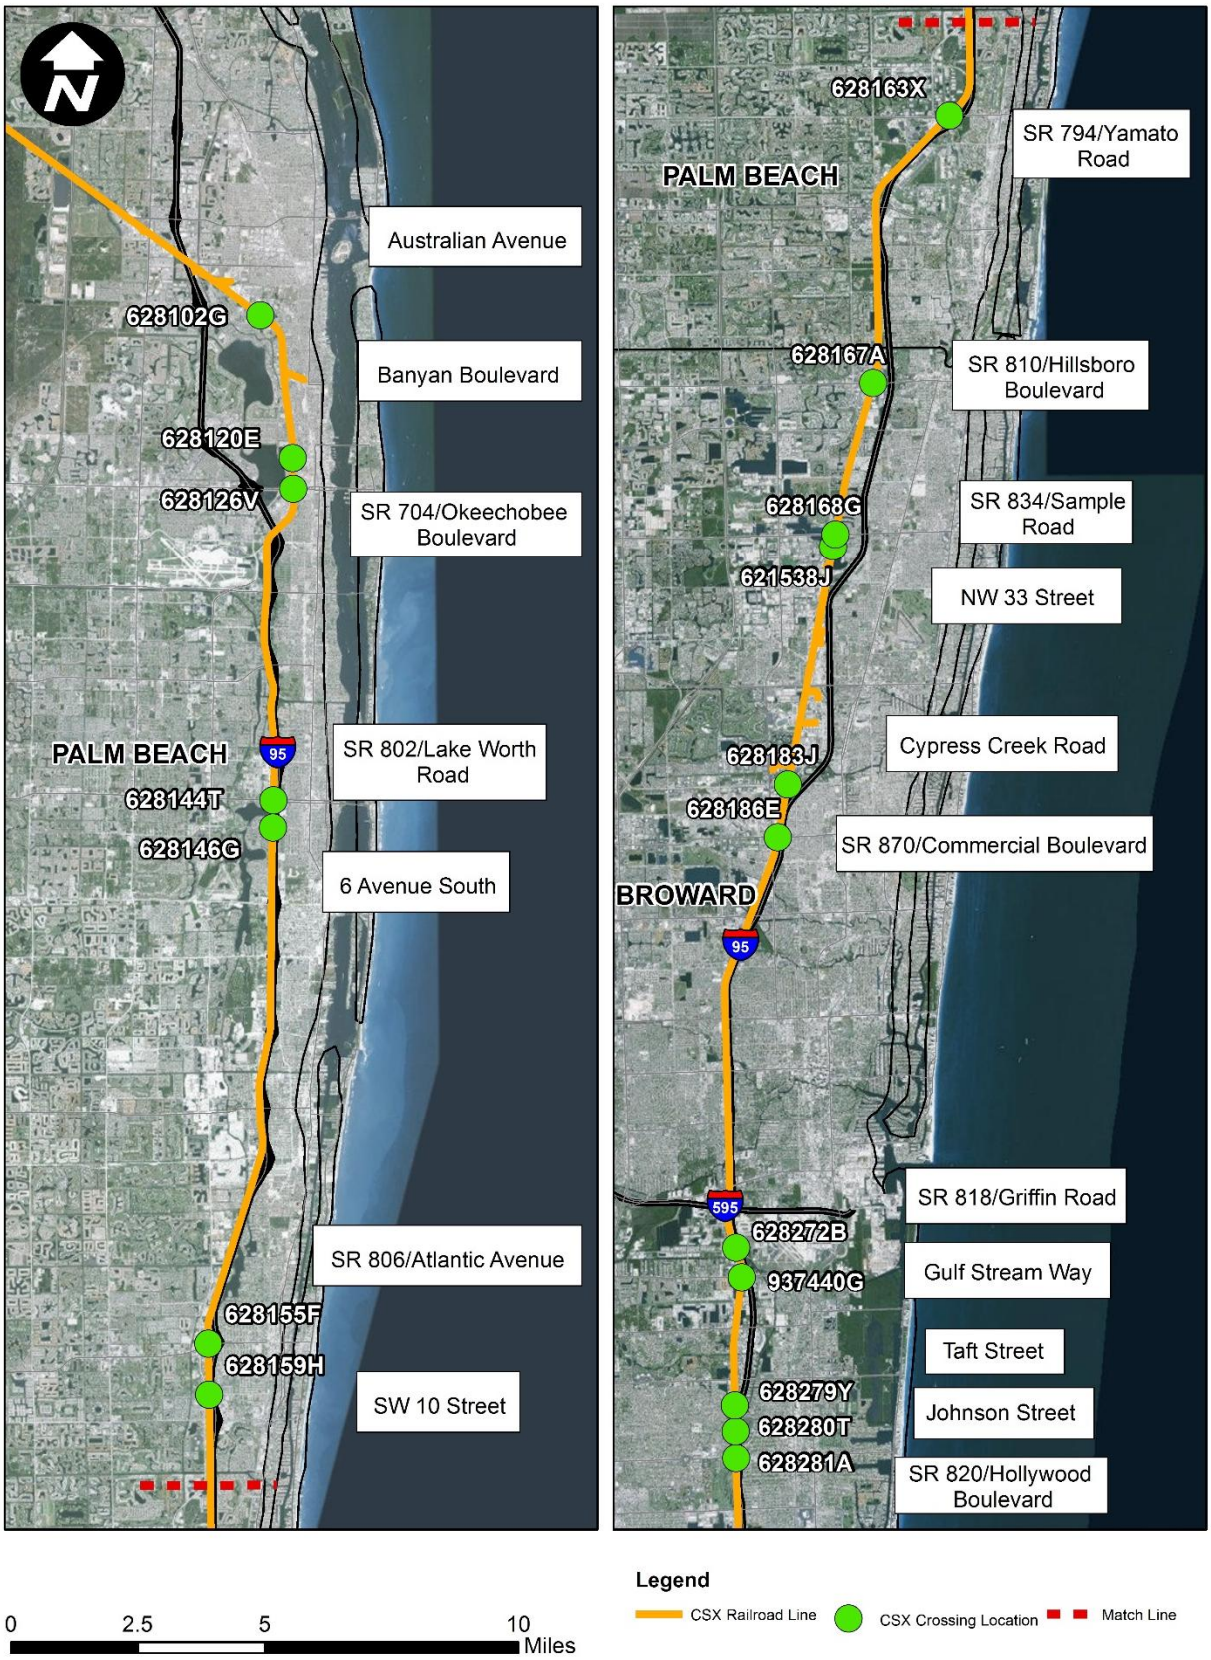

Figure 2: SFRC/CSX Corridor Crossing Study Locations

Videos were reviewed for clarity and view of the intended approach. The following analysis includes times where a sufficient view of the corridor and of the approach were provided. Two crossings, Johnson Street and SR 802/Lake Worth Road, were not analyzed due to poor or incomplete video. The SFRC/CSX corridor crossing at Banyan Boulevard was only analyzed in the westbound direction due to lack of corridor data for the day on which the eastbound approach was recorded. At Northwest 33 Street, only 12 hours of data were available for both the westbound approach and the corridor.

DATA ANALYSIS

Average delay per vehicle at each intersection was calculated by recording the delay (in seconds) of the first, median, and last vehicle in the queue. The following equation was used:

$$Delay_{Total} = \frac{\#\ of\ Veh}{2} \times \left[\left(\frac{Delay_1 + Delay_M}{2}\right) + \left(\frac{Delay_M + Delay_L}{2}\right)\right] \times \frac{1\ min}{60\ sec}$$

Where,

$Delay_{Total}$	Total delay due to gate closing event, reported in vehicle-minutes,
# of Veh	Number of vehicles queued at approach,
$Delay_1$	Delay, in seconds, experienced by the first vehicle in the queue,
$Delay_M$	Delay, in seconds, experienced by the median vehicle in the queue, and
$Delay_L$	Delay, in seconds, experienced by the last vehicle in the queue.

The data that was analyzed is summarized below in Table 9.

Table 9: Data Collected (SFRC/CSX Corridor)

Roadway Crossing Location	County	Total Hours Analyzed	Times Analyzed

Banyan Boulevard (WB)	Palm Beach	24	6/07/2016 00:00 to 6/08/2016 00:00
Australian Avenue (NB)	Palm Beach	24	6/07/2016 00:00 to 6/08/2016 00:00
Australian Avenue (SB)	Palm Beach	24	6/07/2016 00:00 to 6/08/2016 00:00

RESULTS

The SFRC/CSX corridor serves both freight and passenger rail. Typically, freight trains operate overnight to reduce conflict with Tri-Rail service, which operates from approximately 5:00 A.M. to midnight. Passenger trains typically result in shorter gate closures than freight trains. However, the presence of stations in proximity to an at-grade crossing often triggers gate closures even though no train is crossing. Examples of Tri-Rail stations where incoming passenger trains approaching a station trigger a gate closure without actually crossing the road include at SR 820/Hollywood Boulevard (southbound Tri-Rail trains approaching the Hollywood station) and at SR 794/Yamato Road (northbound Tri-Rail trains approaching the Boca Raton station). In both instances, the approaching train triggers a gate closing event before arriving at the passenger station. While the train dwells in the station, the gates go back up to allow motor vehicles to cross the railroad even though no train ever crossed the road. Then when the train is ready to depart the passenger station, another gate closing event is triggered for the train to cross the road.

The following tables summarize the crossing delay analysis for the eighteen (18) selected crossings. Raw data for each crossing is provided, by approach, in **Appendix B.**

The SFRC/CSX corridor experiences a significant number of gate closing events per day, ranging from 50 events along SR 820/Hollywood Boulevard to 103 events at 6 Avenue. However, median gate closing duration remains fairly consistent along the corridor, ranging between 34 seconds at SR 870/Commercial Boulevard and 1 minute and 47 seconds at SR 818/Griffin Road. The number of gate closing events and event duration is summarized in Table 10.

Table 10: Duration of Gate Closing Events (SFRC/CSX corridor)

Roadway Crossing Location	County	Number of Gate Closing Events Analyzed	Minimum Crossing Duration (min:sec)	Median Crossing Duration (min:sec)	Maximum Crossing Duration (min:sec)
SR 820/Hollywood Boulevard	Broward	50	0:14	1:12	4:17
Taft Street	Broward	58	0:38	1:05	1:07
Gulf Stream Way	Broward	63	0:39	1:47	3:22
SR 818/Griffin Road	Broward	63	0:39	1:47	3:22
SR 870/Commercial Boulevard	Broward	66	0:26	0:34	4:42
Cypress Creek Road	Broward	89	0:19	1:09	3:21
NW 33 Street	Broward	81	0:01	1:29	4:36
SR 810/Hillsboro Boulevard	Broward	69	0:22	1:22	3:11
SR 794/Yamato Road	Palm Beach	77	0:33	0:58	2:28
SW 10 Street	Palm Beach	65	0:27	0:43	1:36
SR 806/Atlantic Avenue	Palm Beach	58	0:36	0:53	1:49
6 Avenue South	Palm Beach	103	0:12	1:13	3:39
SR 704/Okeechobee Boulevard	Palm Beach	50	0:41	1:23	3:02
Banyan Boulevard	Palm Beach	75	0:49	1:36	4:20
Australian Avenue	Palm Beach	56	0:39	1:20	9:00

Queue length and delay varied significantly between eastbound and westbound approaches for some intersections as a result of roadway geometry. Railroad crossings located near an intersection often experienced additional significant delay as a result of operations at that intersection. The difference in impact of the railroad gate closing events is most notable at SR 820/Hollywood Boulevard, SR810/Hillsboro Boulevard, and SR 794/Yamato Road. These three intersections are located in close proximity to the interchange with I-95.

Queue information for each of the railroad crossings analyzed is reported below in Table 11.

Table 11: Queue Length Due to Gate Closing Events (SFRC/CSX corridor)

Roadway Crossing Location	County	Approach Reported[1]	Minimum Queue (vehicles)	Median Queue (vehicles)	Maximum Queue Observed[2] (vehicles)
SR 820/Hollywood Boulevard	Broward	Eastbound	3	65	70
Taft Street	Broward	Eastbound	0	9	21
Gulf Stream Way	Broward	Westbound	0	2	12
SR 818/Griffin Road	Broward	Eastbound	0	25	78
SR 870/Commercial Boulevard	Broward	Eastbound	0	16	60
Cypress Creek Road	Broward	Eastbound	0	24	80
NW 33 Street[3]	Broward	Eastbound	0	3	11
SR 810/Hillsboro Boulevard	Broward	Eastbound	2	25	55
SR 794/Yamato Road	Palm Beach	Eastbound	1	18	40
SW 10 Street	Palm Beach	Westbound	0	5	33
SR 806/Atlantic Avenue	Palm Beach	Eastbound	0	6	36
6 Avenue South	Palm Beach	Eastbound	0	25	90
SR 704/Okeechobee Boulevard	Palm Beach	Westbound	0	33	70
Banyan Boulevard[3]	Palm Beach	Westbound	0	5	40
Australian Avenue	Palm Beach	Southbound	0	11	50

Note: [1] Approach with greater median delay reported.
[2] Queue length reported is an estimation of cars in queue based on available video.
[3] Intersection had incomplete (< 24 hours) data for one or more approaches. Approach with more data is reported.

SR 820/Hollywood Boulevard had the highest median queue, with 65 vehicles per gate closing event. As might be expected, Gulf Stream Way and NW 33 Street had the two lowest median queue lengths (two and three vehicles, respectively) as a result of the low traffic volumes they experience relative to some of the other intersections. Furthermore, vehicles at these two intersections rarely experienced additional delay beyond that of the gate closing event, while most other intersections experienced additional delay due to a red signal following the gates reopening.

In addition to queue length, total delay due to the railroad gate closing events was also calculated and is reported in Table 12. The approach with the higher median delay was reported.

Table 12: Vehicle Delay Due to Gate Closing Events (SFRC/CSX corridor)

Roadway Crossing Location[1]	County	Minimum Delay (veh-min)	Median Delay (veh-min)	Maximum Delay (veh-min)	Total Daily Delay (veh-min)
SR 820/Hollywood Boulevard	Broward	2.99	97.48	237.13	4,769.37
Taft Street	Broward	0.00	4.21	32.29	381.00
Gulf Stream Way	Broward	0.00	1.06	15.85	210.03
SR 818/Griffin Road	Broward	0.00	14.67	247.00	1,943.45
SR 870/Commercial Boulevard	Broward	0.00	6.12	224.25	748.92
Cypress Creek Road	Broward	0.00	13.95	130.00	1,715.34
NW 33 Street	Broward	0.00	1.48	17.42	238.93
SR 810/Hillsboro Boulevard	Broward	1.23	19.48	101.06	1,801.55
SR 794/Yamato Road	Palm Beach	0.48	9.17	45.33	806.38
SW 10 Street	Palm Beach	0.00	1.90	22.83	173.94
SR 806/Atlantic Avenue	Palm Beach	0.00	2.02	23.75	265.03
6 Avenue South	Palm Beach	0.00	23.58	162.38	3,270.30
SR 704/Okeechobee Boulevard	Palm Beach	0.00	30.41	272.00	2,212.82
Banyan Boulevard	Palm Beach	0.00	3.06	68.03	610.53
Australian Avenue	Palm Beach	0.00	7.46	180.21	708.92

Note: [1] Approach with greater median delay reported. If intersection had incomplete (< 24 hours) data, approach with more data is reported.

SR 820/Hollywood Boulevard experienced the greatest delay per direction, with a total delay of 4,769.37 vehicle-minutes (approximately 79.5 vehicle-hours). SR 818/Griffin Road, Cypress Creek Road, SR 810/Hillsboro Boulevard, 6 Avenue, and SR 704/Okeechobee Boulevard all experience daily delay greater than 1,700 vehicle-minutes.

It should be noted that several crossings located near a Tri-Rail station experienced significant delay due to 'non-event' gate closings. These 'non-events' were often a result of the passenger train approaching the station, resulting in the gates being lowered at the crossing before the train was ready to cross.

A peak-hour analysis was also conducted. For each crossing, the hour with the highest total delay was analyzed. Table 13 summarizes the peak-hour and delay for the peak approach at each crossing.

Table 13: Total Peak Hour Vehicle Delay (SFRC/CSX corridor)

Roadway Crossing Location	County	Peak Hour Period (Time)	Number of Peak Hour Gate Closing Events	Total Duration of Gate Closures (min:sec)	Total Vehicles Stopped (vehicles)	Total Delay in Peak Hour (veh-min)
SR 820/Hollywood Boulevard (EB)	Broward	8:00 - 9:00	8	11:28	525	876.60
Johnson Street	Broward	*Insufficient data collected, not analyzed*				
Taft Street (WB)	Broward	7:19 - 8:19	6	07:24	93	112.50
Gulf Stream Way (WB)	Broward	17:10 - 18:10	5	09:09	34	46.37
SR 818/Griffin Road (EB)	Broward	14:15 - 15:15	3	05:33	91	361.90
SR 870/Commercial Boulevard (EB)	Broward	11:30 - 12:30	3	05:47	87	232.20
Cypress Creek Road (EB)	Broward	16:30 - 17:30	7	08:29	363	249.71
NW 33 Street[1] (WB)	Broward	16:59 - 17:59	7	14:15	57	74.11
SR 834/Sample Road	Broward	*Insufficient data collected, not analyzed*				
SR 810/Hillsboro Boulevard (EB)	Broward	17:12 - 18:12	5	11:09	207	294.13
SR 794/Yamato Road (EB)	Palm Beach	17:15 - 18:15	9	08:54	242	137.60
SW 10 Street (WB)	Palm Beach	15:54 - 16:54	8	06:00	107	56.80
SR 806/Atlantic Avenue (EB)	Palm Beach	17:45 - 18:45	6	06:08	90	47.91
6 Avenue South (EB)	Palm Beach	7:00 - 8:00	8	10:15	406	510.66
SR 704/Okeechobee Boulevard (WB)	Palm Beach	7:24 - 8:24	6	09:52	260	673.81
Banyan Boulevard (WB)	Palm Beach	7:29 - 8:29	6	11:33	41	118.21
Australian Avenue (NB)	Palm Beach	19:30 - 20:30	6	16:46	110	285.95
Australian Avenue[2] (NB)	Palm Beach	6:40 – 7:40	5	07:09	102	134.22

Note: [1] Less than 24 hours were analyzed for NW 33 Street westbound approach, peak provided is highest for either direction.
[2] Australian Avenue has one gate closing event that lasted 9 minutes, resulting in 243.54 vehicle-minutes of delay. A second peak-hour analysis was conducted to account for this outlier.

SR 820/Hollywood Boulevard experiences the greatest peak-hour delay, with 876.6 vehicle-minutes of delay. NW 33 Street was the railroad crossing that experienced the lowest delay, despite having one of the longest total gate closure times (14 minutes 15 seconds) during the peak hour.

The SFRC/CSX corridor almost exclusively serves as a passenger rail corridor between Broward and Palm Beach counties. As a result, delay by type of closing event was not analyzed.

COMPARISON TO PRIOR YEARS

One of the goals for the Railroad Crossing Delay Program is the historic evaluation of median vehicle delay to identify trends for at-grade crossings over time. Three of the railroad crossings were studied in 2006, 2009, 2011, 2012, 2013, and 2014. The remaining crossings are being studied for the first time, and therefore no delay information is available for previous years. The data available for previous years was only collected between 6:00 A.M. and 8:00 P.M. For comparative purposes, only gate closing events that occurred within this specified 14-hour period were analyzed.

Table 14: Summary of Median Peak Direction Delay Per Gate Closing (SFRC/CSX corridor)

Roadway Crossing Location	County	Median Vehicle Delay per Gate Crossing (veh-min) *(6:00 A.M. to 8:00 P.M.)*						
		2006	2009	2011	2012	2013	2014	2016[2]
SR 820/Hollywood Boulevard[1]	Broward	123	78	44	63	37	246	104
Taft Street	Broward	No Data Collected						4
Gulf Stream Way	Broward	No Data Collected						2
SR 818/Griffin Road	Broward	No Data Collected						15
SR 870/Commercial Boulevard	Broward	17	40	9	9	8	12	7
Cypress Creek Road	Broward	No Data Collected						18
NW 33 Street[1]	Broward	No Data Collected						2
SR 810/Hillsboro Boulevard	Broward	No Data Collected						21
SR 794/Yamato Road	Palm Beach	No Data Collected						10
SW 10 Street	Palm Beach	No Data Collected						3
SR 806/Atlantic Avenue	Palm Beach	10	15	7	10	5	12	4
6 Avenue South	Palm Beach	No Data Collected						40
SR 704/Okeechobee Boulevard	Palm Beach	No Data Collected						35
Banyan Boulevard	Palm Beach	No Data Collected						5
Australian Avenue	Palm Beach	No Data Collected						9

Note: [1] Events analyzed for Hollywood Boulevard are not from a continuous 14-hour period, and may not be truly representative of the analysis period as data that was collected may be more heavily weighted toward morning times.
[2] Median vehicle delay per gate crossing is reported for peak direction, and is rounded to the nearest whole vehicle-minute.

Median delay decreased for the three intersections analyzed in previous years. SR 820/Hollywood Boulevard saw a decrease of over 50%. SR870/Commercial Boulevard also saw a decrease in median delay from 12 to 7 vehicle-minutes, the lowest recorded yet. The same is true for SR 806/Atlantic Avenue, which experienced a median vehicle delay of 4 vehicle-minutes during the analysis period, the lowest recorded since the program was initiated in 2006.

It should be noted that the vehicle-delay data were recorded throughout different times of the year, and were not adjusted using a seasonal factor. Therefore, comparison between various years may be affected if data are recorded during a peak or an off-peak time of year.

SUMMARY

A total of 18 at-grade crossings were valuated along the SFRC/CSX corridor in Broward and Palm Beach counties. SR 708/Blue Heron Boulevard experienced the highest median vehicle delay per crossing event, with 97.5 vehicle-minutes per gate closure. SR 708/Blue Heron Boulevard also had the highest total 24-hour and peak-hour vehicle delays, 4,769.37 vehicle-minutes, and 876.6 vehicle-minutes, respectively.

COMPARATIVE ANALYSIS

The SFRC/CSX corridor and the FEC corridors both serve urban, developed areas of the Southeast Florida Region. The two corridors differ significantly in terms of type of operations and impact on the roadway network.

The FEC primarily serves as a freight corridor, and often operates through or near downtown core areas to provide connectivity to shipping and intermodal facilities. Trains operating on the FEC tend to be significantly longer in length than those operating along the SFRC/CSX corridor, and therefore result in longer gate closing events (with median gate closing time ranging between 2.5 and 3.5 minutes). Median delay along the FEC corridor ranges from 1.7 vehicle-minutes (SR A1A/N Causeway) to 24.6 vehicle-minutes (SR 708/Blue Heron Boulevard). Palm Beach County experiences greater delay than Martin, St. Lucie, and Indian River counties. This is likely due to the fact that Palm Beach County is more populated, resulting in more vehicles on the road. Additionally, Palm Beach county had an average of 6 gate closing events during peak-hours, while the Treasure Coast area experienced an average of 2 gate closing events per peak hour.

The SFRC/CSX corridor primarily serves as a passenger corridor, and operates along SR 9/I-95. Due to the nature of passenger rail, the highest concentration of gate closing events happens during morning and evening peak periods, when people are commuting to and from work. At those same times, SR 9/I-95 experiences its highest traffic volumes, resulting in significant delays at crossings located near on/off ramps. The median gate closing duration for the SFRC/CSX corridor is significantly lower than that of the FEC, ranging between 0.5 and 1.8 minutes. However, due to the proximity to upstream/downstream signals and to SR 9/I-95, median delay at the SFRC/CSX corridor at-grade crossings is higher at intersections affected by additional signal delay associated with the railroad crossing. Median delay along the SFRC/CSX corridor ranged from 1.1 vehicle-minutes (Gulf Stream Way) to 97.5 vehicle minutes (SR 820/Hollywood Boulevard).

The relationship between duration of gate closing events and the associated vehicle delay is depicted in Figure 3 and Figure 4.

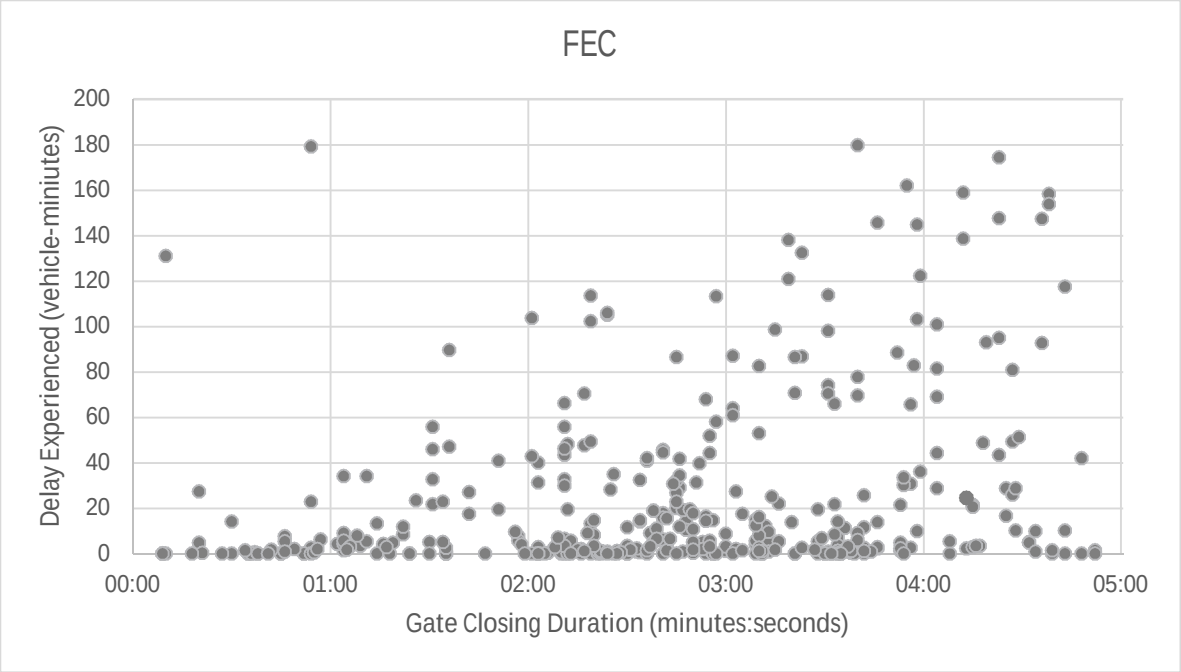

Figure 3: Gate Closing Duration versus Delay (FEC)

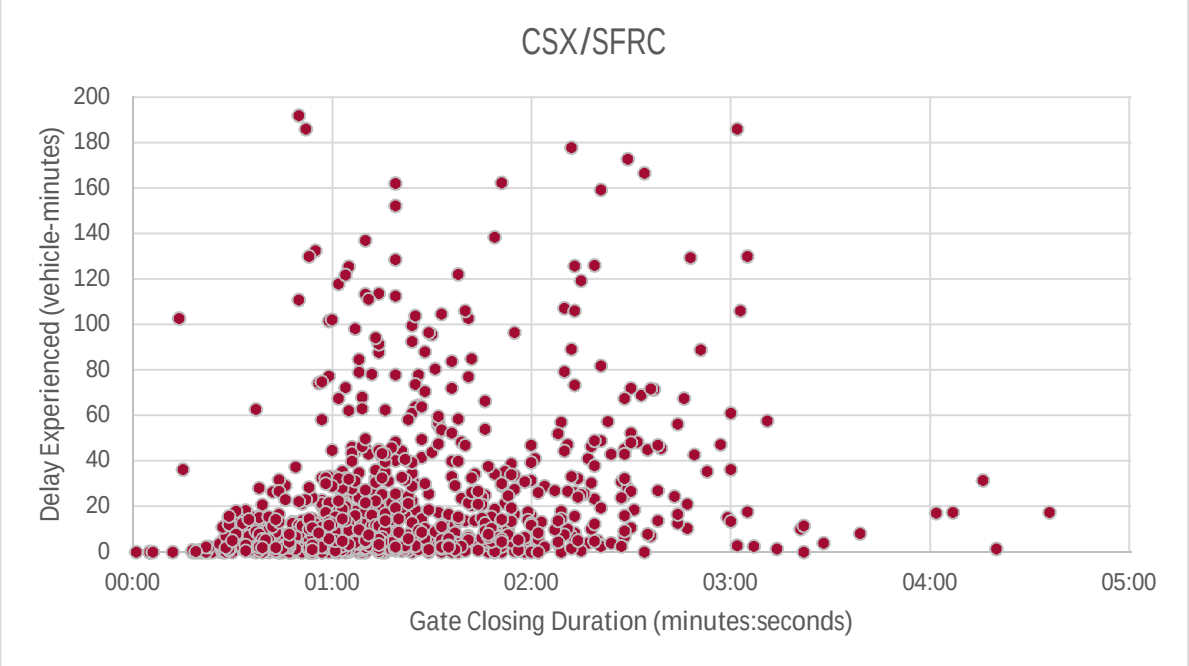

Figure 4: Gate Closing Duration versus Delay (SFRC/CSX corridor)

As seen in Figure 3, crossings vary significantly in duration along the FEC. However, vehicle delay tends to be 10 vehicle-minutes or less.

Conversely, the SFRC/CSX corridor tends to have average crossing duration below 2 minutes, yet vehicle delay is noticeably higher even for shorter gate closing durations.

LESSONS LEARNED/RECOMMENDED IMPROVEMENTS

The collection of complete data is crucial to the success of the Railroad Crossing Program. Several issues were identified that should be considered moving forward:

Quantity of Data Collection:

For almost all railroad crossings, three sets of video data were collected: one for each roadway approach, and one of the railroad corridor. However, it is recommended that for future studies, only the peak direction of delay be recorded. The peak direction should be determined based on historical data, traffic patterns, and most importantly, surrounding roadway geometry. By filming queues for only one direction, it may suffice to use only one video camera that shows both the crossing and the approach. To help count the number of vehicles in the queue, an additional camera can be used to record vehicles as they cross the railroad tracks.

For the railroad crossings analyzed in 2016, it is recommended that future studies analyze only the peak approach identified in this report.

Collecting data for the peak direction only would be more cost efficient, allowing for more crossings to be analyzed each year. Costs associated with data analysis can also be reduced by coordinating with local traffic control centers to obtain the time of each gate closing events at crossings adjacent to a signalized intersection. This would allow for more efficient analysis of the data, particularly for the FEC corridor.

Visibility:

Several issues were identified with regard to visibility including camera angle, lighting, distance, and quality of video.

Video Quality – the data were collected using a mix of HD and SD cameras. Higher resolution allows for more consistent and reliable data analysis. It is recommended that future data collection use a minimum of 720p.

Camera Angle – the camera should be placed in such a way that the first vehicle in the queue can be seen. Additionally, the camera should be placed in a location where no objects obstruct the view of the camera. If placed on the side of the approach road, the camera should be high enough to provide a view of all lanes even when a vehicle is in the adjacent lane.

If data are collected for only the peak approach, it is critical that the camera facing the railroad corridor has a view of the crossing gates. This allows viewers to distinguish between vehicles stopped due to gate closings, and vehicles stopping due to signals and traffic congestion.

Lighting – lighting was an issue during the night-time, as the glare from headlights limits the ability to see vehicles queueing and sometimes made it difficult to distinguish the number of vehicles in the queue. Collecting data during summer months would allow for the most hours of daylight. Alternatively, some filter could be applied to reduce glare at night.

Distance – another challenge associated with video data is the length of the queues that is visible. While it may not be feasible to ensure that all vehicles in the queue are visible, it may be beneficial to set minimum standards for ‘visible distance’ from crossing.

Time of year:

The Southeast Florida region experiences significant fluctuations in traffic patterns due to seasonal residents and tourism. The fluctuations in traffic volumes at different times of the year have a significant impact on the total delay experienced. Therefore, it is recommended that videos always be recorded during the same time of the year. Alternatively, the appropriate seasonal correction factor or peak season correction factor could be applied to the queue lengths to account for variability.

1. INTRODUCTION

Florida Department of Transportation (FDOT) is programmed to conduct a PD&E study for I-95 from Miami-Dade/Broward County Line to north of Griffin Road, including interchange improvements at Sheridan Street, Stirling Road, and Griffin Road (FM 439170-1-22-01). The PD&E study will evaluate the recommendations proposed by the Broward County I-95 Interchange Master Plan (IMP) and subsequent recommendations by the I-95 Corridor Planning Study for these limits. Within the study limits, FDOT District 4 is completing a PD&E study from SR-858/Hallandale Beach Boulevard to SR-820/Hollywood Boulevard (FM 436903-1-22-02) with the focus to improve interchange and ramp terminals intersection capacity at Hallandale Beach Boulevard, Pembroke Road, and Hollywood Boulevard. South of this PD&E study limits, FDOT District 6 is conducting a PD&E study along I-95 from SR-860/Miami Garden Drive to Miami/Broward County Line (FM 414964-1-22-01). The District 4 Planning and Environmental Management Office (PLEMO) has retained CTS Engineering, Inc. to perform traffic data collection and traffic forecasting and projection (no-build condition) for the PD&E study. This report describes the methodology and presents the results of the data collection and traffic projection efforts. The following tasks have been performed under this study:

Task 1. Traffic Data Collection Methodology

This task is to collect traffic data within the study limits of the PD&E and summarize traffic data under the existing transportation conditions. The major subtasks include the following:

- **Perform full intersection counts:** Three-day full intersection data collection was conducted for the intersections along three study corridors: Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor.
- **Conduct interchange 72-hour classification counts:** Three-day vehicle classification counts were collected at the ramps of the interchanges for I-95 at Ives Dairy (5 ramp locations), Hallandale Beach Boulevard (4 ramp locations), Pembroke Road (4 ramp locations), Hollywood Boulevard (4 ramp locations), and I-595 (8 ramp locations).
- **Collect I-95 Express Lanes traffic data using video cameras:** Three-day traffic and class counts were collected for express lanes within the study limits from north of Ives Dairy Road to south of I-595 through image processing.

- **Collect and summarize vehicular Origin-Destination (OD) Data:** StreetLight[1] data was obtained to prepare the OD matrix between selected locations from south of Ives Dairy Road to north of I-595 along I-95**.**
- **Perform arterial 72-hour counts:** Three-day vehicle classification counts were collected at four locations: Sheridan Street east of N 29th Avenue, Stirling Road west of Compass Road, Griffin Road east of I-95 NB ramp, and Griffin Road west of I-95 SB ramp.

Task 2 – Traffic Projections Methodology

As part of this study, traffic projections were prepared for future year (2045) under the No-Build conditions. Based on the coordination with the Department, the No Build conditions are defined as transportation network with the inclusion of Cost Feasible Plan improvements in the adopted MPO 2045 Long Range Transportation Plan (LRTP). In addition, preferred alternative from the I-95 PD&E study from Hallandale Beach Boulevard to Hollywood Boulevard are included as part of the No-Build conditions. Subtasks under this task include the following:

- **Data Gathering for Project Traffic from Past Studies:** The traffic projections and forecasts were collected for the I-95 PD&E Study from Hallandale Beach Boulevard to Hollywood Boulevard PD&E, the I-95 Corridor Planning Study led by FDOT District 6, and the I-95 PD&E study from Miami Garden Drive to Miami/Broward County Line led by District 6, in proximity to the study limits. Coordination has been carried out with the I-95 Express Team, I-95 PD&E Team from Hallandale Beach Boulevard to Hollywood Boulevard, and District 6's I-95 PD&E Team south of the county line to ensure traffic projections and improvements from various sources are considered.
- **Subarea Model Forecast for No-Build Conditions:** The socioeconomic data, network coding, and other model settings were reviewed to make sure they are consistent with the base year (2021) conditions. A future year (2045) no-build network in Southeast Florida Regional Planning Model (SERPM) was developed based on the 2045 Cost Feasible Plans adopted by the three MPOs in the region. The no-build network also includes the proposed improvements from the aforementioned projects in coordination with the Department.
- **Future Traffic Projections:** Trends analysis was conducted using the historical traffic counts. The growth factors were calculated using the population and employment data obtained from the SERPM model. A set of recommended growth rates were proposed based on the trends analysis, socioeconomic data, and model volumes for all approaches at the study intersections. The growth rates were applied to current AADT volumes to obtain projections for the open year (2021), interim year (2030), design year (2045) and 2050. Coordination was carried out to ensure the AADT projections at the county line along I-95 are consistent with the AADT forecasted by the I-95 PD&E Team south of the county line.

Figure 1 presents the study corridors, ramps, and intersections of this study. The rest of this report documents the methods and results of abovementioned tasks.

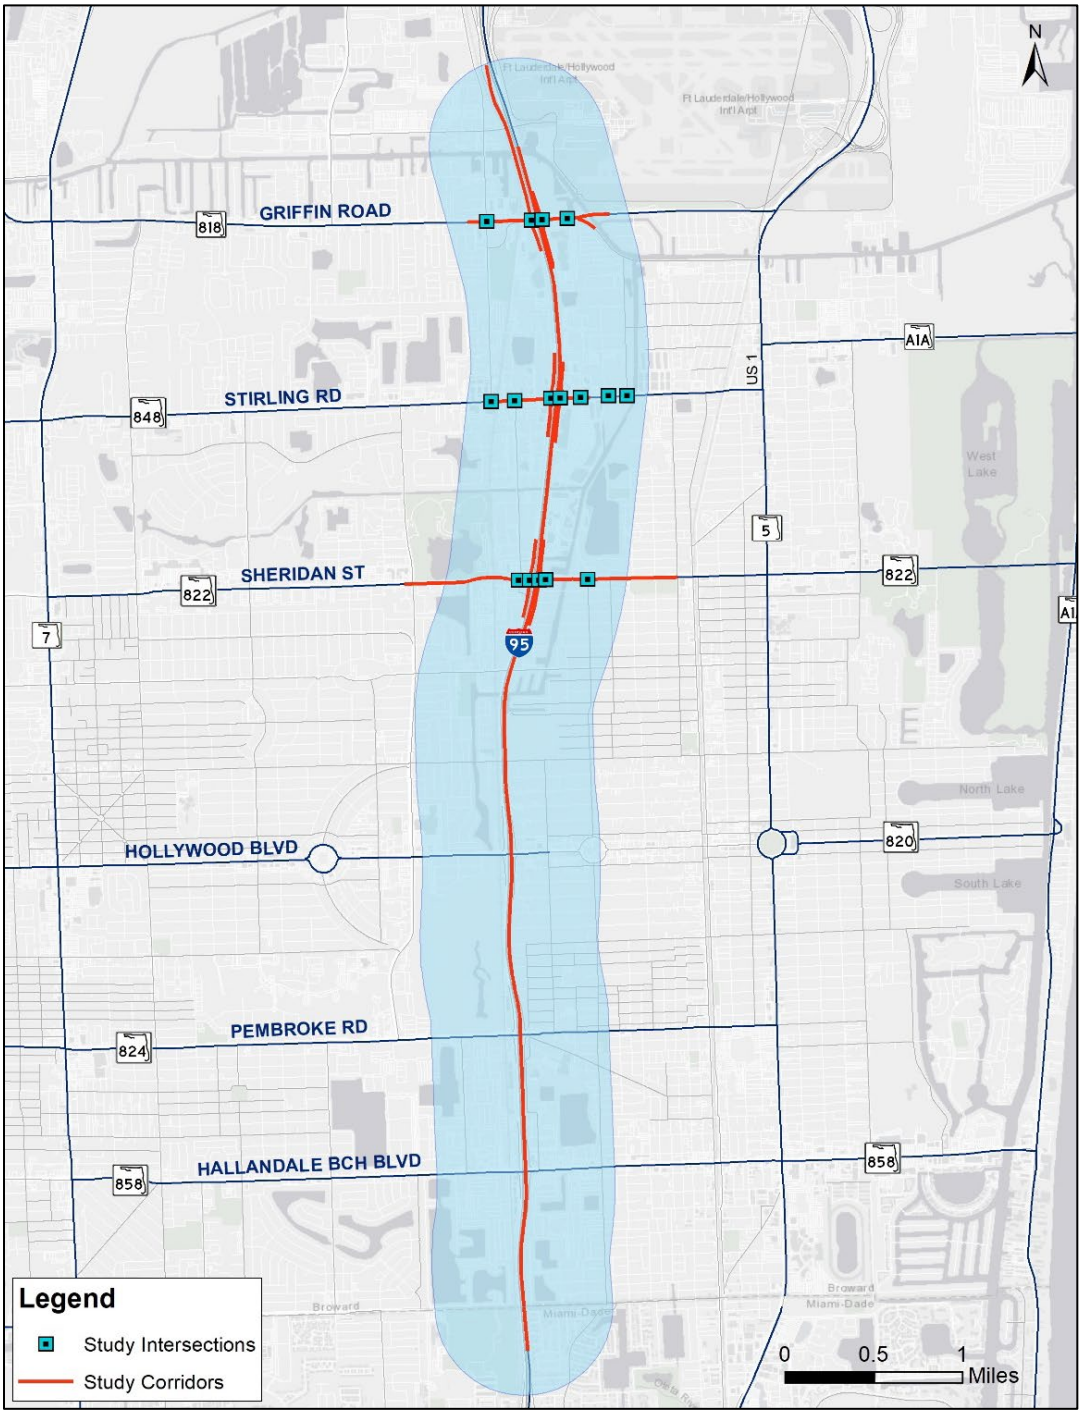

Figure 1. Study Corridor and Study Intersections

2. TRAFFIC DATA COLLECTION

This section documents the traffic data collection efforts conducted as part of this TWO. Figure 2 presents the locations for turning movement counts and ramp classification counts. Appendix A presents all traffic data collected in this study.

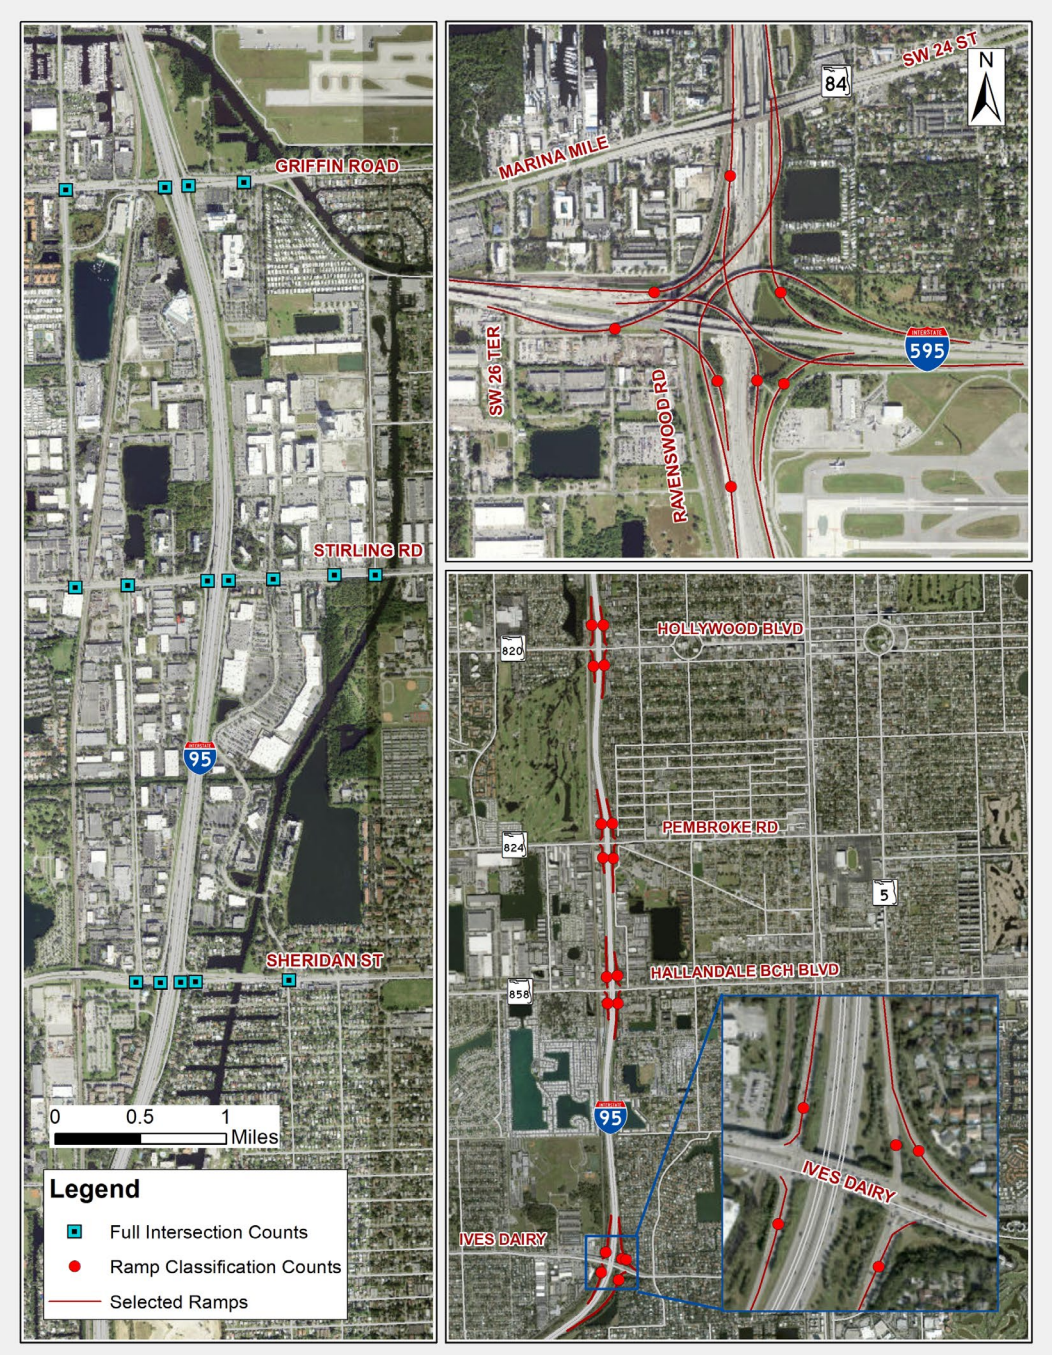

Figure 2. Intersection Counts and Ramp Class Counts Locations

2.1 Full Intersection Counts

Three-day full intersection data collection was conducted for 16 intersections along three corridors where interchange improvements were proposed: Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor. Full intersection data collection includes 6-hour peak period turning movement counts (6:00 AM to 9:00 AM, 4:00 PM to 7:00 PM), and 72-hour link counts for three consecutive weekdays (Tuesday to Thursday). Seventy-two-hour vehicle classification counts were conducted on I-95 ramps. Additional classification counts were also collected along the following arterial roads:

- Sheridan Street east of N 29th Avenue
- Stirling Road west of Compass Road
- Griffin Road east of I-95 NB ramp
- Griffin Road west of I-95 SB ramp

The dates and locations for full intersection counts for Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor are presented in Table 1 to Table 3, respectively.

Table 1. Full Intersection Counts along Sheridan Street Corridor

Data Collection Dates	Turning Movement Counts	72-Hour Counts	
	Count Location	Count Type	Count Location
11/9/2021-11/11/2021	I-95 NB Off Ramp Terminal at Sheridan Street	Classification	I-95 NB On Ramp N of Sheridan Street
		Classification	Sheridan Street E of I-95 NB Ramps
		Classification	I-95 NB Off Ramp S of Sheridan Street

2.3 Express Lane Data Collection

Video cameras were used to monitor express lanes traffic within the study limits from south of I-595 to north of Ives Dairy Road. Images were taken at the two ingress and two egress points of the express lanes for three consecutive weekdays (Tuesday to Friday). Then, images were processed to determine the number and class of vehicles in and out of the express lanes. Seventy-two-hour counts were reported in the same manner as the turning movement counts in 15-minute interval. The dates and locations of express lane camera data collection are summarized in **Table 5**.

Table 5. Express Lane Camera Data Collection

Data Collection Dates	Ingress/Egress Point	Count Location
11/9/2021-11/11/2021	Ingress	I-95 Express Lanes N of Ives Dairy Road, NB
11/9/2021-11/11/2021	Egress	I-95 Express Lanes N of Ives Dairy Road, SB
11/16/2021-11/18/2021	Ingress	I-95 Express Lanes S of I-595, SB
11/9/2021-11/11/2021	Egress	I-95 Express Lanes S of I-595, NB

3. TRAFFIC DATA SUMMARY

This section documents the methodology used to develop base year (2021) traffic volumes, including the annual average daily traffic (AADT) volumes, peak hour approach volumes, and peak hour turning movement counts.

For this study, the three-day average traffic volumes were used, together with the applicable axle correction factors and seasonal factors (**Appendix A-5** and **Appendix A-6**) that are published on FDOT Florida Traffic Online (2019), to calculate the 2021 AADTs for each approach of the study intersections. For classification counts, since the number of vehicles were collected instead of axles, axle correction factors were not applied. The 2021 AADT at I-95 south of Hallandale Beach Boulevard was calculated based on counts at two FDOT sites (#862487 and #861487). Other I-95 mainline 2021 AADTs were calculated based on ramp volumes and the 2021 AADT at I-95 south of Hallandale Beach Boulevard. The observed daily traffic counts, average daily counts, and calculated 2021 AADTs are presented in **Table 6** and **Appendix A-7**. Then, the calculated AADTs were balanced in coordination with the Project Team from FDOT District 6 that is conducting the I-95 PD&E Study from north of Golden Glades Interchange (GGI) to south of Hallandale Beach Boulevard. Balanced 2021 AADTs are presented in **Table 6** and illustrated in **Figure 3**.

The peak hours for the study corridor were determined based on the observed turning movement counts collected along Sheridan Street Corridor, Stirling Road Corridor, and Griffin Road Corridor. The observed AM peak hour is 7:30 AM to 8:30 AM, and the observed corridor's PM peak hour is 5:00 PM to 6:00 PM. To estimate base year (2021) peak hour volumes, the average values of 3 days observed counts during corridor peak hours were calculated. Then, the average peak hour counts were rounded up to the nearest 5. The rounded peak hour volumes are showed in **Appendix A-8**. Finally, the rounded peak hour turning movement counts were balanced in coordination with the Project Team from FDOT District 6 that is conducting the I-95 PD&E Study from north of Golden Glades Interchange (GGI) to south of Hallandale Beach Boulevard. The base year (2021) balanced peak hour turning movement volumes and approach volumes are presented in **Figure 4**.

4. ORIGIN-DESTINATION ANALYSIS

To provide an understanding of the travel pattern along the corridor and provide information for PD&E study stage, StreetLight data was downloaded for 80 zones along I-95 from south of Ives Dairy Road in Miami-Dade County to north of Davie Boulevard in Broward County. The origin-destination (OD) locations are showed in **Figure 5** and summarized in **Table 7**.

All Streetlight Data was obtained for one month (September 2021). Only weekday daily data was selected for developing the traffic patterns along the study corridor. The origin-destination matrix for eighty StreetLight zones can be found in **Appendix D**. Eighteen StreetLight zones were selected to show the major flows from each crossing corridors as well as I-95. **Table 8** summarizes the origin-destination matrix for the selected zones.

The through traffic between I-95 south of Ives Dairy Road and I-95 north of Davie Road is about 26,000 for both directions.

For traffic started from I-95 south of Ives Dairy Road, the major destinations are Ives Diary Road east of I-95 (11,600), Hallandale Beach Boulevard Off Ramps (11,500), Pembroke Road Off Ramps (7,400), Hollywood Boulevard Off Ramps (6,800), and I-595 east (4,200) and west (5,700) of I-95.

For traffic started from Ives Dairy Road, about 10,500 vehicles stayed on Ives Dairy Road travelling to the east and west. Among the traffic started from Ives Dairy Road east of I-95, about 9,800 vehicles travelled to Miami along I-95, about 4,600 vehicles went to I-595 west of I-95, and about 4,600 vehicles travelled to I-95 North of Davie Road. Among the traffic started from Ives Dairy Road west of I-95, about 6,200 vehicles travelled to Miami along I-95.

For traffic getting on I-95 from Hallandale Beach Boulevard, about 13,000 vehicles travelled to Miami along I-95, about 4,000 vehicles went to I-595 west of I-95, and about 4,300 vehicles travelled to I-95 north of Davie Road.

For traffic getting on I-95 from Pembroke Road, there are about 7,400 vehicles travelling to Miami along I-95, about 7,000 vehicles getting off I-95 from Hallandale Beach Boulevard, and about 4,800 vehicles travelling to I-95 north of Davie Road.

For traffic getting on I-95 from Hollywood Boulevard, there are about 7,300 vehicles travelling to Miami along I-95, about 4,100 vehicles getting off I-95 from Hallandale Beach Boulevard, about 4,500 vehicles getting off I-95 from Pembroke Road, about 4,200 vehicles going to I-595 west of I-95, and about 5,200 vehicles travelling to I-95 north of Davie Road.

For traffic started from Griffin Road, the majority of traffic (6,200 – 6,600) stayed on Griffin Road travelling to the east and west, and about 2,300 – 2,400 vehicles travelled to Miami along I-95. About 1,900 vehicles from Griffin Road east of I-95 and about 3,400 vehicles from Griffin Road west of I-95 travelled to I-95 north of Davie Road.

For traffic started from Stirling Road, the majority of traffic (8,700 – 8,800) stayed on Stirling Road travelling to the east and west, and about 2,000 vehicles travelled to Miami along I-95 from both directions. Among the traffic started from Stirling Road east of I-95, about 2,700 vehicles went to I-595 west of I-95, and about 2,500 vehicles travelled to I-95 North of Davie Road. Among

the traffic started from Stirling Road west of I-95, about 1,600 vehicles got off I-95 from Hallandale Beach Boulevard, about 1,500 vehicles went to I-595 west of I-95, and about 2,800 vehicles travelled to I-95 north of Davie Road.

For traffic started from Sheridan Street, the majority of traffic (9,000 – 9,200) stayed on Sheridan Street travelling to the east and west. Among the traffic started from Sheridan Street east of I-95, about 3,300 vehicles went to I-95 South of Ives Diary Road, about 3,800 vehicles went to I-595 west of I-95, and about 3,900 vehicles travelled to I-95 north of Davie Road. Among the traffic started from Sheridan Street west of I-95, about 2,300 vehicles went to I-95 south of Ives Diary Road, about 2,000 vehicles got off I-95 from Hallandale Beach Boulevard, about 1,500 vehicles went to I-595 west of I-95, and about 3,900 vehicles travelled to I-95 north of Davie Road.

For traffic started from I-595 east of I-95, 26,400 vehicles travelled to I-595 west of I-95, 4,900 vehicles travelled to I-95 south of Ives Diary Road, and about 9,000 vehicles travelled to I-95 north of Davie Road.

For traffic started from I-595 west of I-95, 25,000 vehicles travelled to I-595 east of I-95, 5,200 vehicles travelled to I-95 south of Ives Diary Road, and about 28,600 vehicles travelled to I-95 north of Davie Road.

For traffic started from I-95 north of Davie Road, the major destinations are I-595 east (10,000) and west (26,000) of I-95, Hollywood Boulevard Off Ramps (5,600), Pembroke Road Off Ramps (5,400), and Hallandale Beach Boulevard Off Ramps (5,300).

5. TRAFFIC FORECAST

Various traffic forecast methods were evaluated in this study to identify the most reasonable growth rates along the study corridor. Table 9 summarizes three methods to estimate traffic growth rates that were explored in this study.

Table 9. Growth Rate Estimation Methods

Method	Description
Historical Trend	Growth rates are developed based on regression analyses of at least five years of most recent historical AADTs using FDOT Trend Analysis Spreadsheet. The count stations include: • 860027: SR 818 /Griffin Road - E of I-95 W of Old Griffin Road • 860032: SR 848 /Stirling Road - 700' E of SR 9/I-95 • 860034: SR 822 /Sheridan Street - E of SR 9/I-95 • 860076: SR 818 /Griffin Road - W of SR 9/I-95 • 860092: SR 848 /Stirling Road - W of SR 9/I-95 • 860133: SR 848 /Stirling Road - W of Ravenswood Road • 860331: SR 9/I-95, 0.1 Mile N of SR-858/Hallandale Beach Boulevard, Broward • 860631: Old Griffin Road - East of SR-818/Griffin Road (Dummy Site From EB 867319) • 861487: SR 9/I-95 - S of SR 858/Hallandale Beach Boulevard (Express Lanes) • 862454: SR 9/I-95 - S of SR 822/Sheridan Street • 862455: SR 9 / I-95 - S of SR 848/Stirling Road • 862456: SR 9 / I-95 - S of SR 818/Griffin Road • 862458: SR 9 / I-95 - S of SR 862/I-595 • 862487: SR 9/I-95 - S of SR 858/Hallandale Beach Boulevard • 865173: SR 822 / Sheridan Street - W of I-95 500' W of CSX R/R • 865299: SR 818 / Griffin Road - W of US 1 • 868124: Ravenswood Road, S of Griffin Road • 869349: N 29 Avenue, S of Stirling Road
Model Volume Growth	Growth rates are the annual compound growth rates in model AADTs from model base year (2015) to model forecast year (2045).
Socioeconomic Growth	Growth rates are the annual population/employment compound growth rates within the 2-mile buffer around study interchange from model base year (2015) to model forecast year (2045).

Three types of historical trend analyses were conducted: straight line growth, exponential growth and decaying exponential growth. For each location with historical counts, the type of trend analysis with the highest R-squared was selected to produce the final historical growth rate. Historical trend analysis results are presented in **Appendix C**. The historical AADT volumes for all the FDOT count stations are presented in **Appendix A-4**.

Model volume growth rates were calculated using the model AADTs on corresponding model links based on the outputs of the latest regional travel demand model – SERPM 8.513. The model base year is the model validation year 2015 with 2015 socioeconomic data and 2015 transportation network. The model future year is the regional LRTP horizon year of 2045. The 2045 No-Build network was developed in close coordination with FDOT District 4 and District 6 Project Managers and District 6 I-95 PD&E Project Team with support from District 4's I-95 PD&E from Hallandale Boulevard to Hollywood Boulevard Team. The 2045 No-Build network was built by incorporating the Locally Preferred Alternative (LPA) from the I-95 Corridor Planning Study and Golden Glade Interchange (GGI) Ultimate Design as provided by FDOT. The base year 2015 and future year 2045 model volumes along study corridor are presented in **Appendix B-1** and **Appendix B-2**, respectively.

The socioeconomic growth rates were calculated based on SERPM 8.513's population and employment data. For this study, it was noted that the growth patterns might be different between areas east and west of I-95. Therefore, growth rates for the 2-mile buffers east and west of I-95 were developed separately. For each interchange, population and employment growth rates from model base year (2015) to model forecast year (2045) were calculated for three types of buffer areas: micro analysis zones (MAZs) located within 2-mile from the road intersecting I-95, MAZs located no more than 2-mile west of I-95, and MAZs located no more than 2-mile east of I-95. The population and employment data used to calculate the socioeconomic growth rates are presented in **Appendix B-3**.

After reviewing the growth rates calculated using three different forecast methods and adjacent land uses along the corridor, the most reasonable growth rates were recommended. The highest estimated growth rate was usually recommended to develop traffic projections, with two exceptions: (1) If all estimated growth rates were smaller than 0.5%, then a minimal growth rate of 0.5% was applied; (2) If the highest growth rate is not supported by adjacent land use development projection (e.g., existing development is closed to capacity), then a lower growth rate that is more consistent with estimated socioeconomic growth rates was recommended. All calculated and recommended growth rates are summarized in **Table 10**. The recommended growth rates were used to estimate future AADTs for interim year (2030), design year (2045) and 2050 (**Table 11**). Future volumes on C/D ramps from Hallandale Beach Boulevard to N of Hollywood Boulevard were estimated based on the On/Off ramp volumes and future lane geometry. For ramps with express lanes, each forecasted ramp AADT from I-95/I-595 to I-595/I-95 was split into two volumes: the AADT of the ramp from I-95/I-595 general purpose lane to I-95/I-595 general

purpose lane and the AADT from I-95/I-595 express lane to I-95/I-595 express lane. The split percentages were calculated using the 2045 model volumes from SERPM 8.513. **Figure 6**, **Figure 7** and **Figure 8** illustrate 2030 AADTs, 2045 AADTs and 2050 AADTs, respectively.
