# 1 Introduction

This report presents the results of an evaluation of accessibility to jobs by auto throughout the state of Florida. *Accessibility* refers to the ease of reaching valued destinations. It combines the simpler metric of mobility with the understanding that travel is driven by a desire to reach destinations. Accessibility can be measured for various transportation modes, to different types of destinations, and at different times of day. There are a variety of ways to define accessibility, but the number of destinations reachable within a given travel time is highly comprehensible and transparent—as well as the most directly comparable across locations.

This study focuses on access to jobs, the most significant non-home travel destination. Accessibility is calculated at the Census block level by computing the travel time from each block to surrounding blocks, and then adding up the total number of jobs that can be reached within different travel time thresholds. This process is repeated for every block within the state of Florida, and the results are aggregated to provide accessibility summaries for each county, and the jurisdiction of each metropolitan planning organization (MPO), within the state.

Additionally, the impact of traffic congestion on job accessibility is estimated by comparing accessibility during congested periods with accessibility during free-flow periods. This congestion impact metric shows the reduction in job access that travelers experience when congestion reduces road and highway speeds.

[Section 2](#) presents these results, summarized statewide, by MPO, and by county. [Section 3](#) provides an overview of the data sources and methodology used in this study. A separate document, *Access Across America: Auto 2019 Methodology*, describes the methodology and data sources in greater detail.

## 2 Accessibility Evaluation Results

### 2.1 Statewide Accessibility

#### Florida

Job Accessibility Results – Auto, 2019

Total Jobs	<b>8,260,338</b>
Average Job Density (per mi <sup>2</sup> )	<b>154</b>
Total Workers	<b>8,261,223</b>
Average Worker Density (per mi <sup>2</sup> )	<b>154</b>

*Job and worker totals are based on LEHD estimates and may not match other sources.*

#### Average Job Accessibility by Travel Time Threshold (worker-weighted)

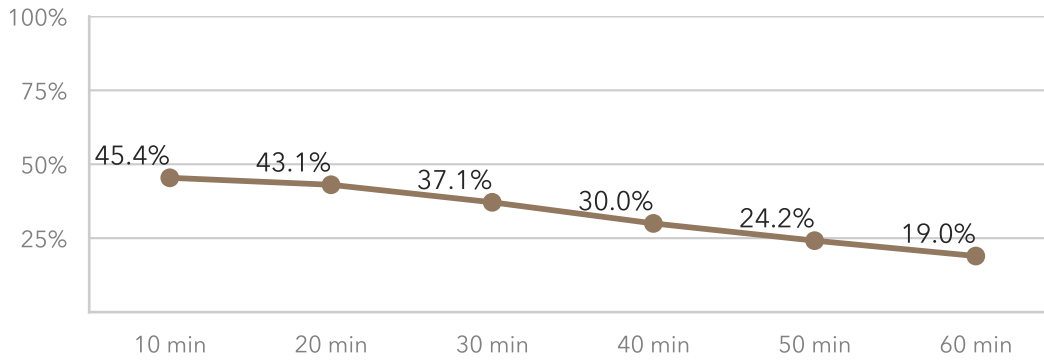

#### 1-Year Change in Average Job Accessibility by Travel Time Threshold (worker-weighted)

### Average Congestion Impact by Travel Time Threshold (worker-weighted)

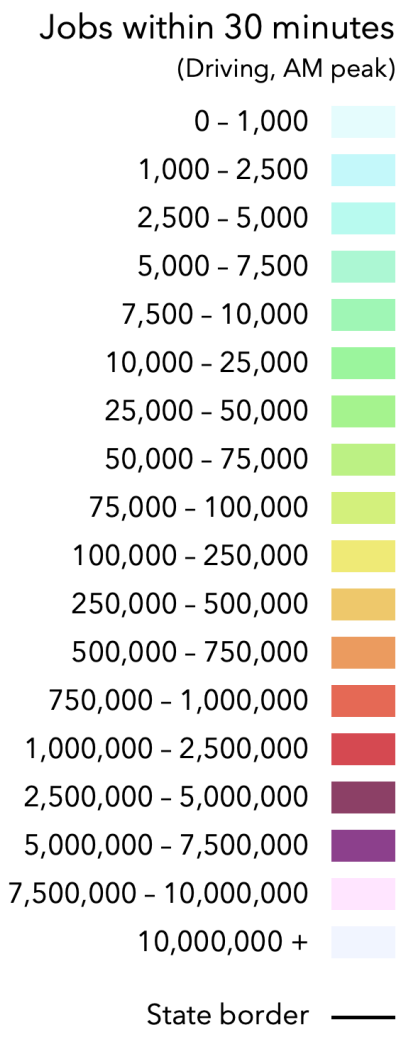

Higher numbers indicate greater job access loss due to congestion

### 1-Year Change in Average Congestion Impact by Travel Time Threshold (worker-weighted)

## **2.2 Accessibility in Metropolitan Areas**

The following sections analyze accessibility in the metropolitan areas (as defined by jurisdictions of metropolitan planning organizations (MPOs)) that lie within or partially within the state of Florida. The following MPO jurisdictions are included:

- Bay County Transportation Planning Organization
- Broward MPO
- Capital Region Transportation Planning Agency
- Charlotte-Punta Gorda MPO
- Collier MPO
- Florida-Alabama Transportation Planning Organization
- Forward Pinellas
- Gainesville MTPO
- Heartland Regional TPO
- Hernando/Citrus MPO
- Hillsborough MPO
- Indian River County MPO
- Lake-Sumter MPO
- Lee County MPO
- METROPLAN Orlando
- Martin MPO
- Miami-Dade TPO
- North Florida Transportation Planning Organization
- Ocala - Marion County Transportation Planning Organization
- Okaloosa-Walton Transportation Planning Organization
- Palm Beach MPO
- Pasco County MPO

- Polk County Transportation Planning Organization
- River to Sea Transportation Planning Organization
- Sarasota-Manatee MPO
- Space Coast Transportation Planning Organization
- St. Lucie Transportation Planning Organization

Table 1 provides the average (worker-weighted) job accessibility by auto during the AM peak period for each MPO, and Table 2 gives the 1-year change in average (worker-weighted) job accessibility by auto. Table 3 indicates the accessibility congestion impact for each MPO, and Table 4 gives the 1-year change in congestion impact. The following pages provide additional details and maps for each MPO.

Table 1: Average Job Accessibility by Travel Time Threshold for Metropolitan Areas (Auto, AM Peak)

<b>MPO</b>	10 min	20 min	30 min	40 min	50 min	60 min
Bay County Transportation Planning Organization	14,303	39,134	60,247	76,648	89,156	110,373

## 2.3 Accessibility by County

Table 5 provides the average (worker-weighted) job accessibility by auto during the AM peak period for each county, and Table 6 gives the 1-year change in average job accessibility by auto. Table 7 indicates the accessibility congestion impact, and Table 8 gives the 1-year change in congestion impact.

Table 5: Average Job Accessibility by Travel Time Threshold for Counties (Driving, AM Peak)

County	10 min	20 min	30 min	40 min	50 min	60 min
Alachua	21,505	76,973	116,841	158,857	228,197	282,925
Baker	3,165	7,800	38,094	215,012	463,501	640,176

## 3 Data Sources and Methodology

The following sections provide a brief overview of the data sources and methodology used to prepare this report. For a detailed description, please consult the Accessibility Observatory's *Access Across America: Auto 2019 Methodology* report.

### 3.1 Travel Times by Auto

Travel times by car were calculated using the June 2019 version of TomTom North America, Inc.'s MultiNet and Speed Profile data products. The road network dataset includes roadways of all functional classifications, including local streets through major highways. Speed data for each roadway segment are based on measurements collected by GPS devices during the June 2016 – June 2019 period. For road segments where speed data are provided separately for different days of the week, data for Wednesday are used.

### 3.2 Geography

Census blocks are the fundamental unit for travel time and accessibility calculation, and block-level accessibility results are aggregated over larger areas for analysis. When calculating accessibility for an individual origin, all potential destinations within 74.6 miles (120 km) are included, even if those destinations are located in a different state. Only locations within the United States are included. The metropolitan planning organization (MPO) jurisdictions used for aggregate analysis are based on data provided in the US Department of Transportation's National Transportation Atlas Database 2016<sup>1</sup>.

### 3.3 Population and Job Distribution

Data describing the distribution of labor and employment in the region are drawn from the U.S. Census Bureau's Longitudinal Employer-Household Dynamics program (LEHD)<sup>2</sup>. The LEHD Origin-Destination Employment Statistics (LODES) dataset, which is updated annually, provides Census block-level estimates of employee home and work locations. This analysis uses LODES data from 2016, the most recent available as of when the calculations were performed.

### 3.4 Accessibility Calculation

The accessibility metrics presented in this analysis are *cumulative opportunity* metrics—they reflect the total amount of opportunities (in this case, jobs) reachable within given travel time thresholds from an origin location. To calculate these metrics, the travel time calculations described above are performed first to identify the travel time from one origin to all surrounding destinations. Next, the number of jobs at each destination is summed for all destinations that can be reached within a given travel time threshold, providing the accessibility value for a single origin at a single departure time.

<sup>2</sup><http://lehd.ces.census.gov/data/>

This process provides accessibility values for individual Census blocks. To summarize this block-level data to larger areas such as MPOs and states, the accessibility values for the relevant blocks are weighted by the number of workers living in each block and then averaged. This person-weighted approach allows the summary metric to reflect the distribution of residents within the area. For example, a person-weighted accessibility value of 134,173 indicates that a typical resident within the area can reach 134,173 jobs. Finally, the person-weighted accessibility is weighted by the travel time threshold so that accessibility at shorter travel times is valued more than accessibility at longer travel times.

Road and highways speeds vary throughout the day. The accessibility data presented in this report assume a departure time of 8 AM in order to represent job accessibility during the AM peak period.

### **3.5 Congestion Impact**

To estimate the impact that congestion has on job accessibility, a series of accessibility calculations are performed on the hour for a 24-hour period. The 24-hour maximum accessibility value is used to capture free-flow traffic conditions at the Census block level for comparison against the 8 AM peak period. The difference between the maximum job accessibility and accessibility at 8 AM is interpreted as the number of additional jobs that a traveler could reach (within a given travel time threshold) in free-flow conditions, but could not reach in congested conditions due to lower speeds. This can be expressed both as an absolute difference in job accessibility, as in the congestion impact maps presented in [Section 2](#), and as a percentage change in accessibility, as shown by the congestion impact plots in [Section 2](#). Expressing this metric as a percentage allows the degree of congestion impact to be compared across regions that have different absolute levels of accessibility. For example, a congestion impact of 9% at the 30 minute travel time threshold indicates that the average worker can reach 9% fewer jobs during congested periods than during free-flow periods.

### **3.6 Comparisons With Previous Years**

This analysis uses the same tools and techniques as *2018 Auto Accessibility Report: Florida*. It also uses the same datasets, updated to more recent versions as detailed in *Access Across America: Auto 2019 Methodology*.

Beginning in data year 2018, federal jobs and federal workers are not included due to changes in underlying datasets from the U.S. Census Bureau. As a result, comparisons between 2018 and 2019 accessibility results are possible, and provide a way to monitor changes in accessibility over time.
