PROJECT LOCATION MAP

FLEXIBLE PAVEMENT DESIGN PACKAGE

Project: Pine Ridge Road (County Road 896) at I-75 (SR 93)
Limits: From 1400 ft. west of I-75 to 1230 ft. east of I-75
County: Collier (03175)
FPID: 445296-1-22-01

Intent and Nature of Project:

The purpose of the project is to provide operational improvements to the I-75/Pine Ridge Road interchange. The intent of the Pine Ridge Road interchange project is to rehabilitate the surface road function as a diverging diamond interchange (DDI), which will significantly reduce delay on Pine Ridge Road, increase the storage capacity of the NB and SB off ramps, and reduce the number of conflict points to improve overall safety.

Project Description

The project improvements for the interchange of I-75 (SR 93) and Pine Ridge Road, (CR 896) is located in Sections 7, 8, 17, 18, T-49-S, R-26-E in western Collier County. Elevations referenced in this report are based on North American Vertical Datum of 1988 (NAVD-1988). Conversion of NGVD-1929 elevations use the equation; NGVD – 1.30 FT = NAVD.

I-75 overpasses Pine Ridge Road as a 6-lane urban principal arterial interstate with an Access Classification of 1. There are no changes proposed to the I-75 typical section width. Pine Ridge Road is a 6-lane urban minor arterial. The Pine Ridge Road existing typical section consists of 12-foot through and center left turn lanes, curb and gutter outside shoulders, and curb and gutter inside shoulders.

AADT and T% (24 Hour) Traffic Data were taken from the Volume Development for the Project Traffic Analysis Report (PTAR) Draft (see appendices), provided by FDOT District One Traffic Operations for the following sites within the project limits:

- Pine Ridge Road, West of I-75: 2019 AADT: 47,500, 2045 AADT: 66,800, T_{24}=6.1%
- Pine Ridge Road, DDI Core: 2019 AADT: 41,600, 2045 AADT: 61,800, T_{24}=6.1%
- Pine Ridge Road, East of I-75: 2019 AADT: 37,000, 2045 AADT: 54,500, T_{24}=6.1%
- I-75 SB on-Ramp A: 2019 AADT: 6,600, 2045 AADT: 7,300, T_{24}= 7.5%
- I-75 NB off-Ramp B: 2019 AADT: 5,600, 2045 AADT: 7,200, T_{24}= 7.5%
- I-75 NB on-Ramp C: 2019 AADT: 10,500, 2045 AADT: 14,400, T_{24}= 7.5%
- I-75 SB off-Ramp D: 2019 AADT: 11,000, 2045 AADT: 14,600, T_{24}= 7.5%

Pavement Survey and Evaluation Report provided by the FDOT (see appendices) is used in this report to assess existing pavement structural Numbers (S_N) and feasible milling and resurfacing schemes for Pine Ridge Road and interchange ramps, based on 2020 FDOT Flexible Pavement Design Manual (FPDM) procedures.

The Resilient Modulus Value of 8,100 psi (LBR 22.83) used in the pavement designs is based on the Embankment Resilient Modulus Pavement Design Report dated May 6, 2020 by the FDOT State Geotechnical Materials Engineer.

The project is within the urban area buffer. No additional projects have been identified within the vicinity of this project.

Proposed DDI Improvements:

The project limits include the SB I-75 on-ramp (Ramp A), the NB I-75 off-ramp (Ramp B), the NB I-75 on- ramp (Ramp C), the SB I-75 off-ramp (Ramp D), and Pine Ridge Road (CR 896) underpass (DDI Core).

Milling and resurfacing with strip widening of Pine Ridge Road, and new construction of the I-75 ramp connections to the DDI crossovers are required to construct a diverging diamond interchange (DDI). Prepare six pavement designs; one for the new ramp construction, one for the ramp shoulders, one for the ramp milling and resurfacing, one for the Pine Ridge Road new roadway construction, one for the paved shoulder on Pine Ridge Road, and one for the milling and

FLEXIBLE PAVEMENT DESIGN PACKAGE

Project: Pine Ridge Road (County Road 896) at I-75 (SR 93)
Limits: From 1400 ft. west of I-75 to 1230 ft. east of I-75
County: Collier (03175)
FPID: 445296-1-22-01

resurfacing of Pine Ridge Road.

SR 93 (I-75) SB on ramp (Ramp A):

- Remove a portion of the existing receiving lane from Pine Ridge Road. Construct one receiving lane from EB Pine Ridge Road (Ramp A1) and one receiving lane from WB Pine Ridge Road (Ramp A2). Mill and resurface the ramp beyond the merge of Ramp A1 and Ramp A2.
- Remove a portion of the existing 1-lane ramp from Pine Ridge Road to the point at which Ramp A1 and Ramp A2 merge.
- Construct a receiving lane from EB Pine Ridge Road (Ramp A1) with a return radius and taper to existing single lane SB entrance Ramp A.
- Construct a wide receiving lane from WB Pine Ridge Road (Ramp A2) with a return radius and transition taper.
- Mill and resurface the 1-lane ramp beyond the point at which Ramp A1 and Ramp A2 merge.

SR 93 (I-75) NB off ramp (Ramp B):

- Remove a portion of the existing departing lane to Pine Ridge Road. Construct two departing lanes to WB Pine Ridge Road (Ramp B1) and one departing lane to EB Pine Ridge Road (Ramp B2). Mill and resurface the ramp prior to the fork of Ramp B1 and Ramp B2.
- Remove a portion of the existing 3-lane ramp from the point at which Ramp B1 and Ramp B2 fork to Pine Ridge Road.
- Construct two departing lanes to WB Pine Ridge Road (Ramp B1) with a return radius and transition taper.
- Construct a departing lane to EB Pine Ridge Road (Ramp B2) with a return radius and transition taper.
- Mill and resurface the 3-lane ramp prior to the point at which Ramp B1 and Ramp B2 fork.

SR 93 (I-75) NB on ramp (Ramp C):

- Remove a portion of the existing receiving lane from Pine Ridge Road. Construct two receiving lanes from EB Pine Ridge Road (Ramp C1) and one receiving lane from WB Pine Ridge Road (Ramp C2). Mill and resurface the ramp beyond the merge of Ramp C1 and Ramp C2.
- Remove a portion of the existing 2-lane ramp from Pine Ridge Road to the point at which Ramp C1 and Ramp C2 merge.
- Construct two receiving lanes from EB Pine Ridge Road (Ramp C1) with a return radius and lane transition taper.
- Construct a receiving lane from WB Pine Ridge Road (Ramp C2) with a return radius and a length of tangent run out lane, plus an initial lane taper with a conjoined terminal taper.
- Mill and resurface the 2-lane ramp beyond the point at which Ramp C1 and Ramp C2 merge.

SR 93 (I-75) SB off ramp (Ramp D):

- Remove a portion of the existing departing lane to Pine Ridge Road. Construct two departing lanes to EB Pine Ridge Road (Ramp D1) and three departing lanes to WB Pine Ridge Road (Ramp D2). Widen, mill and resurface the ramp prior to the fork of Ramp D1 and Ramp D2.
- Remove a portion of the existing 4-lane ramp from the point at which Ramp D1 and Ramp D2 fork to Pine Ridge Road.

FLEXIBLE PAVEMENT DESIGN PACKAGE

Project: Pine Ridge Road (County Road 896) at I-75 (SR 93)
Limits: From 1400 ft. west of I-75 to 1230 ft. east of I-75
County: Collier (03175)
FPID: 445296-1-22-01

- Construct two departing lanes to EB Pine Ridge Road (Ramp D1) with a return radius and tangent run out lanes.
- Construct three departing lanes to WB Pine Ridge Road (Ramp D2) with a return radius and approaching lanes.

- Widen the ramp prior to the point at which Ramp D1 and Ramp D2 fork to provide for five receiving lanes.
- Mill and resurface the taper and single lane ramp prior to the point at which the 5-lane widening of the ramp begins.

Pine Ridge Road:

- Construct diverging diamond interchange (DDI) on Pine Ridge Road from west of the I-75 SB Ramps to east of the I-75 NB ramps.
- Mill and resurface with strip widening, approximately 2,630 feet of Pine Ridge Road for 6-lane diverging diamond interchange (DDI).
- Pine Ridge Road eastbound and westbound profile grades will be developed though the ramp crossovers and DDI core to meet longitudinal grade requirements of the FDOT Design Manual and Drainage Manual. The profile grading will endeavor to maximize the use existing curb lines, maintain 16.0-FT vertical clearance of the I-75 overpass and minimize the requirement of overbuild pavement.
- Eastbound Pine Ridge Road from the I-75 SB on-ramp (Ramp A1) to the I-75 SB off-ramp (Ramp D1) will be rehabilitated as a 4-lane roadway. The eastbound (reversed) outside fourth lane thorough the DDI core will form an entrance lane to the NB entrance Ramp C. Other segments of the Pine Ridge Road DDI are 3-lanes per direction.
- Pine Ridge Road will have a 16.67 FT. +/- median width from inside edge of pavement to inside edge of pavement.
- The existing horizontal clearance between the bridge piers under the existing I-75 bridges of 103 feet must be maintained with the proposed DDI intersection rehabilitation. This limited horizontal clearance precludes adequate width for the seven lane DDI core to provide 7-FT wide bike lanes per the FDOT Design Manual.
- The existing sidewalk along the north side of Pine Ridge Road will be reconstructed within 16.67-FT+/- wide center median of the DDI core with curb barrier walls. The median sidewalk will cross to the outside at the signal control DDI crossover points, and connect to the existing sidewalks at the begin and end of project limits.
- The Pine Ridge DDI core lanes (I-75 underpass) will be reconfigured to 11-FT lanes widths to accommodate the widened median for the barrier protected center sidewalk.

The Pavement Design for this project is based upon an anticipated opening year of 2025 and a 2045 design year. This Pavement Design is evaluated to not require a reduction of the resilient modulus design for the pavement widening design section, since the Pine Ridge Road interchange DDI core and ramps have excess of three feet roadway base clearance above the Base Clearance Water Elevation (BCWE); (2020 Flexible Pavement Design Manual, Section 5.2.2). The estimated BCWE in excess of 3.0-ft. is based on Basin 3 roadside linear pond Control EL. 8.0 (NAVD) from as-built plans for Pine Ridge Road (County Project 60111).

DESIGN NOTES:

1. The Design Speed is 35 MPH for the Pine Ridge DDI, and design speed for all ramps is 55 MPH (25-45 MPH at ramp terminals per Typical Section Package). Based on the Pavement Survey and Evaluation Report provided by the FDOT, the existing flexible pavement has been categorized as being in "Fair Condition" for Pine Ridge Road and all ramps within the interchange.

2. The existing pavement is flexible; therefore, flexible pavement is recommended for all locations within the project limits. The flexible pavement design is based on the FDOT Flexible Pavement Design Manual, (January 2020).

3. The Pavement Survey and Evaluation Report provided by the FDOT, identified some longitudinal cracking and slippage in the SB exit ramp outside right turn lane to Pine Ridge Road. Therefore, this report recommends extending the Pine Ridge Road mainline pavement (with dense graded friction course) into the ramp returns in all four quadrants of the DDI. This recommendation is based on FPDM Section 4.2 Friction Course option to use dense graded friction course on ramps with heavy volume truck traffic and / or turning and stopping movements.

4. All proposed travel lane and shoulder widening and reconstruction will include Type B Stabilization (LBR 40) (12").

5. AADT volumes for the FDOT's ESAL Analysis for Pine Ridge Road and the interchange ramps are provided from the Volume Development for the Project Traffic Analysis Report "Draft" and Forecast 2045 traffic Volumes provided by FDOT District One Traffic Operations. AADT for the existing year 2019 and projection for the 2025 opening year and 2045 20-year design. From this information and the FDOT Flexible Pavement Design Manual, the projected mainline opening year to design year ESAL accumulated and required Structural Number SN_R are as follows:

FLEXIBLE PAVEMENT DESIGN PACKAGE

Project: Pine Ridge Road (County Road 896) DDI at I-75
Limits: Pine Ridge Road at SR 93 (I-75) Interchange
County: Collier (03175)
FPID: 445296-1-22-01

PINE RIDGE ROAD DDI AADT / SNr SUMMARY							
Facility	2019 Existing AADT	2025 Opening AADT	2045 Design AADT	ESALd	Traffic Level	T-24%	SNr
Pine Ridge Rd. (*)	47,500	53,800	66,800	8,824,978	C	6.1	4.78
Ramp A	6,600	6,900	7,300	3,503,453	C	7.5	4.36
Ramp B	5,600	6,500	7,200	3,383961	C	7.5	4.32
Ramp C	10,500	12,100	14,400	7,103,096	C	7.5	4.80
Ramp D	11,000	12,600	14,600	6,726,038	C	7.5	4.82

(*) The AADT for Pine Ridge Road (West of I-75) results in the greatest ESAL counts and is used in the flexible pavement designs for milling and resurfacing, widening and reconstruction, unless otherwise noted for location specific analysis for areas of existing add-on widening.

6. The Pine Ridge Road widening pavement design is based on matching the pavement and base types and thicknesses of the adjoining existing pavement (FPDM Chapter 6), in conjunction with meeting the SNr derived from the ESALd. For design consistency and pavement structure uniformity, pavement reconstruction within the DDI crossovers are intended to utilize the widening pavement design.

7. The Pine Ridge Road milling and resurface analysis provides location specific evaluations for the existing EB and SB outside lane taper to Ramp A and the existing WB to NB outside lane taper for Ramp C. These lanes were add-on widening pavement from the County Project I60111 (See Appendix F). There was no pavement core data performed for these locations; therefore, the analysis assumes this project's AADT / ESAL counts applied to the as-built plans widening pavement details from County Project 60111, and assuming the 0.25 reduced SN from the Core Report. Based on the above design assumptions, the analysis recommends both of these existing outside left turn lane tapers be reconstructed to meet the required Structural SN.

8. The Pine Ridge Road milling and resurface analysis also provides location specific evaluations for the existing Pine Ridge Road WB to SB median left turn lane to Ramp A and the EB to NB median left turn lane to Ramp C, both at the overpass using pavement cores 26 and 40, respectively. The analysis estimates the existing WB to SB left turn lane and the existing EB to NB left turn lane can be integrated into the DDI crossover using the proposed milling and resurfacing design.

9. This report investigates the increased milling depth and resurfacing required to meet the 16.0' vertical clearance at the proposed median (reversed WB) lane at DDI Core Sta. 135+25, LT. The required pavement structural number (Sn) can be achieved with $ESAL_D$ derived from the updated 2045 AADT 61,800, with a 90% Reliability (Urban Arterial Rehabilitation). Meeting the 16.0' vertical clearance at the high inside edge of proposed inside lane widening (Sta. 135+25, LT) requires milling the outside lane cross slope to 0.025 and the middle and inside 11' lanes at 0.015. The proposed inside lane widening would be placed with a 0.01 cross slope to the outside (see sketch on Page 14). The maximum milling depth at the existing inside lane requires 2.33" milling for the bridge clearance, plus 4.5" milling for the required resurfacing, which requires variable milling from 4.5" at the outside edge to 6.83" maximum depth at the inside existing lane. The variable depth milling should be able to transition to uniform milling within 150', or the east edge of the NB I-75 Bridge meeting vertical clearance. Positive longitudinal grade is maintained by the variable depth milling "control point" matching the outside existing rigid curb and gutter barrier wall.

10. The Pine Ridge Road interchange ramps shoulder milling and resurfacing, and new construction required Structural Number for the flexible pavement was evaluated using 3% of rounded design for each respective

ramp. All of the interchange ramps have ESALDd less than 10 million. As such, FPDM Chapter 8.1 allows paved shoulder milled and resurfaced pavement types and thicknesses to use minimum SNR values in Table 5.5 (1.5" structural and OBG-1 = 1.52) in lieu of pavement design based on 3% of ESALd. The milled and resurfaced shoulders use a structural course type and thickness that matches the top lift of the contiguous travel lane for constructability. As such the milled and resurface shoulders exceed minimum SNR requirements and approximate 3% of ESALd. From this information and the FDOT Flexible Pavement Design Manual, the projected mainline opening year to design year ESAL accumulated and required Structural Number SN_R for the ramp shoulders are as follows:

PINE RIDGE ROAD RAMP SHOULDER SNr SUMMARY				
Facility	Ramp Shoulder SNr		Milling and Resurfacing	New Const.
	SNr (Minimum Required)	SNr 3% ESALd	SNr Provided	SNr Provided
Ramp A	1.52	2.46	2.36	2.70
Ramp B	1.52	2.46	2.39	2.70
Ramp C	1.52	2.74	2.66	2.92
Ramp D	1.52	2.74	5.71	2.92

11. The Resilient Modulus of 8,100 psi was provided in the Embankment Resilient Modulus Pavement Design Report dated May 6, 2020 by the FDOT State Geotechnical Materials Engineer. The required Structural Number for Pine Ridge Road were obtained from Table A.6A, and the structural numbers for the ramps were obtained from Table A.7A of the FDOT Flexible Pavement Design Manual.

12. An evaluation of the required reduction in resilient modulus is provided on each pavement design ESAL Determination sheet, based on estimation of the design base highwater clearance elevation (BCWE). The BCWE for the interchange is based on the permitted control elevation 8.0 NAVD for Basin 3 linear ponds adjacent to Pine Ridge Road, as derived form as-built plans for Pine Ridge Road (County Project 60111). Based on review of projected low edges of pavement and depth of the existing pavement systems, the BCWE clearance exceeds 3-FT throughout the interchange. Therefore, no reduction in the resilient modulus is anticipated for the pavement designs.

13. The minimum recommended 1-1/2 inches of milling depth and 1-1/2 inches of Friction Course Type FC-12.5 (PG 76-22) were obtained from the FDOT Pavement Survey and Evaluation Report of SR 93 (I-75), Collier County (03175) prepared on 3/23/2020. An average core method was used to represent the existing SN. Only cores with mile post designations within the milling and resurfacing pavement sections were used to represent the existing SN.

14. Asphalt layers are shown in per inch thickness in the plans. Superpave tonnage is based on 110 LBS / SY per one inch thickness.

15. A reliability factor of 94% is used for the Pine Ridge Road rehabilitation for DDI operation improvements, with the exception of the use of a 90% reliability factor where variable depth milling is required to meet 16.0-ft. bridge vertical clearance for the north side DDI core lane. A reliability factor of 95% is used for the Pine Ridge Road interchange ramps.

16. A design life of 20 years (2025 Opening Year, 2045 Design Year) has been selected for the flexible pavement design per the Flexible Pavement Design Manual, Table 3.1.

17. The functional classification of the SR 93 (I-75) is an Urban Principal Arterial Interstate. The functional classification of Pine Ridge Road is a Minor Arterial.

FLEXIBLE PAVEMENT DESIGN PACKAGE

Project: Pine Ridge Road (County Road 896) DDI at I-75
Limits: Pine Ridge Road at SR 93 (I-75) Interchange
County: Collier (03175)
FPID: 445296-1-22-01

18. FC-5 (PG 76-22) has been selected for use on the SR 93 (I-75) entrance and exit ramps of the project based on a multilane facility with a 55 mph design speed (25-45 MPH at ramp terminals per Typical Section Package). FC-12.5 (PG 76-22) has been selected for use on Pine Ridge Road based on a multilane DDI facility with a 35 mph design speed. The Pine Ridge Road DDI 35 MPH design speed is at the Flexible Pavement Design Manual (FPDM) Table 4-1 minimum threshold for the use of a friction course. The RFP scope recommends the use of a dense graded friction course to augment the DDI curvature friction factors and turning maneuvers.

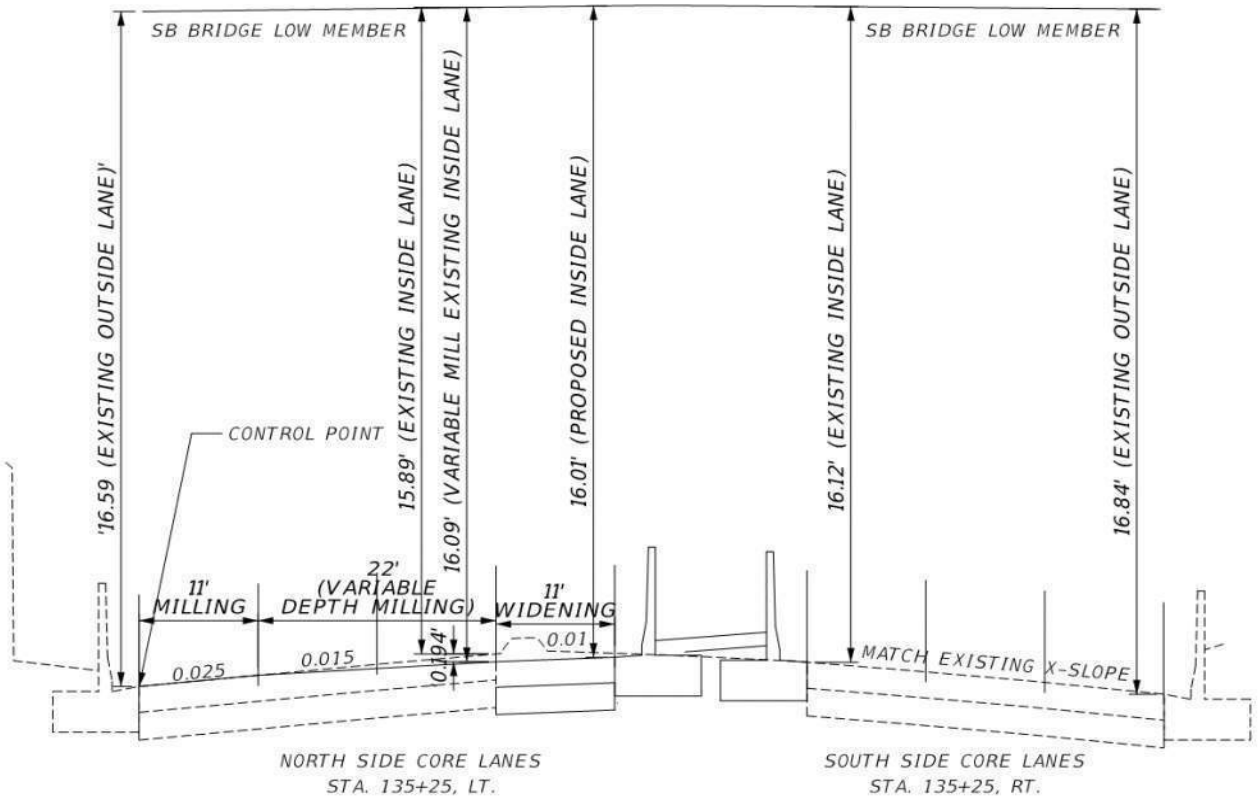
DESIGN SKETCH (Pine Ridge Road) WB DDI

Deep Milling and Resurfacing for meeting 16.0-ft Bridge Vertical Clearance

FPID: 445296-1-22-01 **DATE: 8/19/2020**

SNR Required:	**4.533**	
SNR Provided:	**4.622**	



This report investigates the increased milling depth and resurfacing required to meet the 16.0' vertical clearance at the proposed median (reversed WB) lane at DDI Core Sta. 135+25, LT. The required pavement structural number (Sn) can be achieved with $ESAL_D$ derived from the updated 2045 AADT 61,800, with a 90% Reliability (Urban Arterial Rehabilitation). Meeting the 16.0' vertical clearance at the high inside edge of proposed inside lane widening (Sta. 135+25, LT) requires milling the outside lane cross slope to 0.025 and the middle and inside 11' lanes at 0.015. The proposed inside lane widening would be placed with a 0.01 cross slope to the outside (see above sketch). The maximum milling depth at the existing inside lane requires 2.33" milling for the bridge clearance, plus 4.5" milling for the required resurfacing, which requires variable milling from 4.5" at the outside edge to 6.83" maximum depth at the inside existing lane. The variable depth milling should be able to transition to uniform milling within 150', or the east edge of the NB I-75 Bridge meeting vertical clearance. Positive longitudinal grade is maintained by the variable depth milling "control point" matching the outside existing rigid curb and gutter barrier wall.

DESIGN SKETCH 3A1 (Ramp A Milling and Resurfacing)

PAVEMENT SURVEY AND EVALUATION REPORT
SR 93 (I-75) AT PINE RIDGE ROAD (OFF SYSTEM ROAD)

INTRODUCTION

In response to your request, the District Materials Office conducted a pavement survey and evaluation of Pine Ridge Road in Collier County for the subject project. We understand this project involves the design of a diverging diamond interchange and milling and resurfacing at SR 93 and Pine Ridge Road (Off System Road).

The objective of this work was to identify the existing pavement composition and to assess the pavement conditions, based on which to make recommendations for milling depth and resurfacing plan. This work involves a field review, pavement coring, data analysis, and reporting.

FIELD REVIEW

The objective of the field review is to gain a good understanding of the overall pavement condition, and to help determine the layout of the core locations. This review was performed on February 26, 2020 by our asphalt field specialist, Brent Grubbs, and the results of this review are included in Appendix 1.

Typical Section

There are three main typical sections within the project limits. Pine Ridge Road and Livingston Road consist of a six-lane divided asphalt pavement structure with curb and gutter and turn lanes. The SR 93 On and Off ramps consists of one lane with turn lanes and paved shoulders.

Pavement Condition

The pavement has a dense-graded friction course with the exception of the ramps where an open-graded friction course was found. The overall condition of these sections is fair with minimal cracking. The exception is Napa Blvd. which is in fair condition with moderate to severe cracking throughout.

CORING INFORMATION

The pavement coring was performed on February 26 and 27, 2020 according to Section 3.2 of the Materials Manual- *Flexible Pavement Coring and Evaluation*.

A total of fifty-five (55) cores were extracted, twenty-five (25) cores from Pine Ridge, nine (9) cores from Livingston, three (3) from Napa Blvd., four 4) from Whippoorwill Lane and fourteen (14) from the ramps. Pictures of core samples and locations are illustrated in Appendix 2. The coring data, including cross slope and the type of base materials, are presented in Appendix 3.

REHABILITATION RECOMMENDATION

Considering the existing pavement conditions, we render the following recommendation for milling and resurfacing.

MAINLINE, TURN LANES AND SHOULDERS (EXCEPTION BELOW)

- Mill 1.5 inches
- Resurface with 1.5 inches of FC 12.5.

EXCEPTION
NAPA LANE

- Mill 2.0 inches
- Resurface with 2.0 inches of FC 12.5.

Appendix 4 provides an illustration of the milling and resurfacing recommendations.

COMMENTS AND GENERAL NOTES

In addition to the recommendations made within this report, the following items should be considered when preparing the contract documents for the subject project:

Notes to the Designer

1. Due to the variable asphalt pavement thickness, and the frequency in which the preliminary pavement cores were taken, isolated areas of the base may be exposed.

2. Milling may need to be adjusted at the beginning and end of the project, side streets, bridge deck, approach slabs or areas in which constraints dictate. Appropriate plan details need to be illustrated in the plans in accordance with the FDOT Flexible Pavement Design Manual (FPDM).

The identification of the different pavement layers is based on visual classification as well as familiarity with the site. The actual classification may be different due to variability in asphalt mixes and roadway construction. The information in this report is based on the conditions found at the time of our investigation. The engineer shall notify us if the type of work proposed for the project changes and/or existing conditions change prior to the letting of the project. This report is based on the fact the project will be designed and constructed in accordance with the Standard Specifications, Standard Plans, Flexible Pavement Design Manual and other available information unless stated otherwise within this report.

Please contact this office if additional service is required or if there are any questions regarding this report at D1-D7Pavement@dot.state.fl.us

APPENDIX 1

Field Review Findings

445296-1

Naples, Collier County

I-75 @ Pine Ridge – Only Ramps, Pine Ridge Rd, Livingston Rd, Whippoorwill Ln and Napa Blvd

Inspected By : Brent Grubbs 2/26/2020

Pine Ridge/ CR 869 – Off System Roadway

From W of Livingston Rd to Napa Blvd, MP 0.000 – 1.360

6 – Lanes C & G, C & G median, Center TLS, TLS and Side Streets.

MPH – 45

Right Roadway

R-1 and R-2

MP 0.000 – 1.360 has lite longitudinal cracking, worming throughout and .2 - .5 rutting.

R-3

MP 0.000 – 1.010 has lite longitudinal cracking, worming throughout and .2 - .5 rutting.

Patch MP 1.010 – 1.050 - is in good condition with .2 rutting.

MP 1.050 – 1.360 has lite longitudinal cracking, worming throughout and .2 - .5 rutting.

Left Roadway

L-1, 2 and 3

MP 1.360 – 1.076 has lite longitudinal cracking, worming throughout and .2 - .5 rutting.

Patch MP 1.076 – 1.000 - is in good condition with .2 rutting.

MP 1.000 – 0.000 has lite longitudinal cracking, worming throughout and .2 - .5 rutting.

Center Turn Lanes – have some lite longitudinal cracking.

Turn Lanes - have some lite longitudinal cracking. Also, slippage in the right turn lane to Whippoorwill Lane, **Pic 1.**

Side Streets – have lite longitudinal cracking.

Livingston Rd – Off System Rdwy

From Phoenix Associates Entrance to Urgent Care Building – MP 0.000 – 0.230.

6 – Lanes with C & G, TLS, C & G Median.

MPH – 45

Right Roadway

R-1, 2 and 3
MP 0.000 – 0.230 has lite longitudinal cracking throughout with .3 - .4 rutting and some worming.

Left Roadway

L-1, 2 and 3
MP 0.230 – 0.000 has lite longitudinal cracking throughout with .3 - .4 rutting and some worming.

Turn Lanes – have lite longitudinal cracking.

Whippoorwill Lane – Side Street

Has lite to severe cracking throughout.

Napa Blvd - Side Street

Has severe cracking throughout.

Ramps at I-75 and Pineridge Road

North Bound on Ramp – has lite longitudinal cracking.
South Bound off Ramp – has some lite longitudinal cracking. Also, slippage in outside right turn lane to Pine Ridge Rd.
South Bound on Ramp – is in fair condition.
North Bound off Ramp – is in fair condition.

Note:

- **Structural requirements were not calculated in this design.**
- **In the event that the depicted pavement design will not be adequate based on structural calculations, overbuild thickness should be adjusted to meet the required structural number and/or other constructability purposes. If modification to the milling depth will be necessary to meet the required structural number contact this office for a revised recommendation.**

APPENDIX 5

Pavement Survey Request

Asphalt Survey Request

ID	125
Request Viewed	☐
Project Status	Phase I
Project Manager:	Nicole Harris
District	1
FM No:	445296-1
Project Type:	Preliminary
County:	Collier
Roadway ID:	
SR:	93
US:	
Project Description:	The project involves the design of DDI at the interchange of I-75 and Pine Ridge Road at MP 56.145, in Collier County. Additional improvements at Livingston Road, Whippoorwill Lane, and Napa Boulevard are also included in the full scope of work.
Begin MP:	56.145
End MP:	56.145
Survey Request Date	2/4/2020
Survey Report Due Date	5/30/2020
Supplementary Data:	Location Map
Please specify if the project has any realignment involved and/or locations of widening/reconstruction)	The project has the potential for realignment of ramps and widening at the intersections.
Typical Section:	Urban
Spec Year:	
Friction Course Type:	
Traffic Level:	
Pavement Condition:	
Cracking:	
Structures:	
Areas of Concern:	
Is this a "Goes With" project?	Yes
If yes, Lead Project Number:	442519-2
Charge to Financial Project ID:	445296-1
Email Address	nicole.harris@dot.state.fl.us

(**) Note: Ramp has $ESAL_D$ less than 10 million, therefore FPDM Chapter 8.1 allows paved shoulder milled and resurfaced pavement types and thicknesses to use minimum SN_R values in Table 5.5 in lieu of pavement design based on 3% of $ESAL_D$. Milled and resurfaced shoulder matches structural structural pavement type, thickness and traffic level of adjoining travel lane pavement, and meets minimum SN_R requirements.

MEMORANDUM

DATE: May 6, 2020

TO: Teresa Puckett, District Geotechnical Materials Engineer

FROM: David Horhota, State Geotechnical Materials Engineer

SUBJECT: Embankment Resilient Modulus Pavement Design
District 1, Collier County
FPN 445296-1: I-75 at Pine Ridge Road

Six (6), 2-bag samples were received by the State Materials Office (SMO) for determination of an embankment (roadbed) resilient modulus for pavement design. After visual observation of the six samples, it was determined that the material from each 2-bag sample looked visually similar and the material from each of the bags were combined to form one sample from each location. After combining materials from the bags, samples from each location were obtained for classification tests (Atterberg limits, particle size analysis, and organic content), Proctor density, and resilient modulus. The classification test results are reported in Tables 1 and 2. Information provided for this project by Tierra, Inc. indicated all samples were collected from between 0.0 and 2.0 feet in depth.

Table 1. Summary of Initial Soil Gradation Results

MR-5	100.0	100.0	100.0	100.0	100.0	95.9	74.3	24.4	1.6
MR-6	100.0	100.0	100.0	100.0	99.9	96.3	75.6	22.8	1.5

Table 2. Summary of Soil Classification and Organic Content Results

Sample ID	Location	Soil Class.	Organic Content (%)	LL/PI
MR-1	414211, 683368	A-3	1.0	N.P.
MR-2	414543, 683358	A-3	1.3	N.P.
MR-3	414418, 682997	A-3	0.3	N.P.
MR-4	415055, 683214	A-3	0.2	N.P.
MR-5	415216, 683559	A-3	0.1	N.P.
MR-6	415452, 683208	A-3	0.2	N.P.

In addition to the classification testing, the following test program was conducted:

(1) Standard Proctor, AASHTO T 99
(2) Resilient Modulus (M_R), AASHTO T 307.

A summary of laboratory test results is included in Table 3. The resilient modulus values listed in this table were obtained using the relationship developed from each individual test (resilient modulus versus bulk stress - with bulk stress, **Θ,** defined as $\Theta = \sigma_1 + \sigma_2 + \sigma_3$), and using a bulk stress of 11 psi, which is the recommendation from Dr. Ping's research work in modeling the embankment in-situ stresses for Florida pavement conditions. Two results are listed for each location because two samples were prepared for each location and they represent the individual test result from each sample tested. The resilient modulus samples were compacted to within 1 pound per cubic foot (pcf) of the maximum density and 0.5 percent of the optimum moisture content as determined by AASHTO T99.

Table 3. Summary of T-99 and M_R Test Results

Sample ID	Passing No. 200, %	Standard Proctor Density, pcf	Optimum Moisture Content, %	Resilient Modulus @ Θ=11psi (psi)
MR-1	3	101.2	14.6	8,640
				8,867
MR-2	2	108.8	12.5	11,829
				12,080
MR-3	1	103.3	14.2	9,879
				10,352
MR-4	2	101.4	13.6	10,027
				9,616
MR-5	2	104.7	12.4	10,465
				11,036
MR-6	2	99.0	14.9	7,528
				7,966

To obtain a design embankment resilient modulus, a 90 percent method was used as outlined in both the Flexible Pavement Design Manual and Soils and Foundations Handbook. The resilient modulus values were ranked in ascending order and the percentage of values which were greater than or equal to the individual value were determined. The results of this analysis are recorded in Table 4 and the corresponding graph of these results is included as Figure 1.

Table 4. Ranked M_R Test Results for 90 Percent Method

Rank	Sample ID	% ≥	M_R (psi)
1	MR-6 (2)	100	7,528
2	MR-6 (1)	92	7,966
3	MR-1 (1)	83	8,640
4	MR-1 (2)	75	8,867
5	MR-4 (2)	67	9,616
6	MR-3 (1)	58	9,879
7	MR-4 (1)	50	10,027
8	MR-3 (2)	42	10,352
9	MR-5 (1)	33	10,465
10	MR-5 (2)	25	11,036
11	MR-2 (1)	17	11,829
12	MR-2 (2)	8	12,080

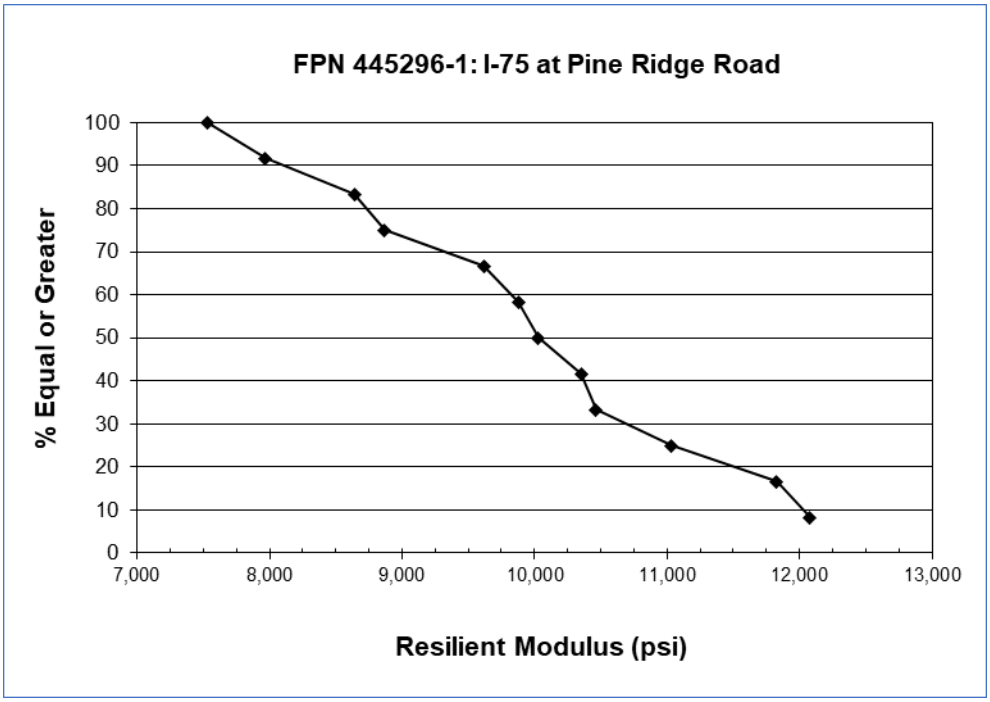

Figure 1. Ranked M_R Test Results for 90% Method

Based on the results shown in Table 4 and Figure 1, the resilient modulus corresponding to a 90th percentile is **8,100 psi**, which would represent the design embankment M_R value.

1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. between Tuesday, February 19, 2019 and Thursday, February 21, 2019. On Wednesday, February 20, 2019, turning movement counts were collected at all study intersections. There was one 72-hour bi-directional classification count, fourteen 72-hour bi-directional volume counts, and thirteen turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts, which can be found in **Appendix A**. An analysis of these counts indicates the AM peak hour occurred between 7:45 AM and 8:45 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the existing year (2019) design traffic volumes for the I-75 and Pine Ridge Road interchange. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

2.1 Field Collected AADT

Existing year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. The exception to this was on the I-75 mainline where counts were not collected as part of this study effort and AADTs from Florida Traffic Online were used directly (COSITE 030191 north of Pine Ridge Road and COSITE 032003 south of Pine Ridge Road). Seasonal and axle correction factors for February 2019 were downloaded from Florida Traffic Online for 2018, prior to the release of the 2019 data. The seasonal factor for Collier County for the week of February 18, 2018 is 0.86, compared to a seasonal factor for Collier County for the week of February 17, 2019 of 0.88. There was not an axle correction factor available for Pine Ridge Road from Florida Traffic Online and so axle correction factors from SR-84 west of US-41 (just to the south of the study area with similar land uses) was used as a surrogate. The axle correction factor for that location for February 18, 2018 was 0.98, compared to 0.99 in the 2019 data. This comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected existing year (2019) AADT volumes.

Table 2.1: Field Collected Existing Year (2019) AADT

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
I-75 Mainline					
North of Pine Ridge Road	N/A	N/A	N/A	89,215	89,000
South of Pine Ridge Road	N/A	N/A	N/A	79,000	79,000

Whippoorwill Lane, south of Pine Ridge Road	14,992	0.86	0.98	12,635	12,500
Logan Boulevard, north of Pine Ridge Road	13,742	0.86	0.98	11,852	11,500
Logan Boulevard, south of Pine Ridge Road	30,195	0.86	0.98	25,448	25,500

*This count was a vehicle classification count.
**AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the existing year (2019), opening year (2025), and design year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the existing year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 14 intersections in the study area. During the AM peak hour, the PHF ranges from 0.89 to 0.96 with a weighted average of 0.93. During the PM peak hour, the PHF ranges from 0.91 to 0.98 with a weighted average of 0.95.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Pine Ridge Road and Livingston Road	0.94	0.97
Livingston Road and Uniforms Unlimited	0.92	0.95
Pine Ridge Road and Starbucks	0.92	0.93
Pine Ridge Road and Meridian Plaza	0.94	0.94
Pine Ridge Road and Kraft Road	0.95	0.92
Pine Ridge Road and Whippoorwill Road	0.96	0.93
Whippoorwill Road and Dudley Drive	0.93	0.91
Pine Ridge Road and Larson Way	0.95	0.94
Pine Ridge Road and I-75 Southbound Ramp Terminal	0.92	0.97
Pine Ridge Road and I-75 Northbound Ramp Terminal	0.92	0.96
Pine Ridge Road and Napa Boulevard	0.93	0.97
Pine Ridge Road and Vineyards Boulevard	0.91	0.98
Pine Ridge Road and Logan Boulevard	0.89	0.98
Average	**0.93**	**0.95**

However, a PHF of 0.95 is recommended for opening year (2025) and design year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.3 percent. The weighted average of the PM PTD is 8.8 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. However, the standard PTD of 9.0 percent was used in the development of traffic volumes for the Pine Ridge Road Interchange Study.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
I-75 Mainline					
North of Pine Ridge Road	89,215	8,029	9.0%	8,006	9.0%
South of Pine Ridge Road	79,000	7,427	9.4%	7,481	9.5%
I-75 Ramps to/from Pine Ridge Road					
Southbound On-Ramp	6,648	518	7.8%	488	7.3%
Southbound Off-Ramp	11,001	764	6.9%	784	7.1%
Northbound On-Ramp	10,270	685	6.7%	774	7.5%
Northbound Off-Ramp	5,619	425	7.6%	490	8.7%
Along Pine Ridge Road					
West of Livingston Road	45,959	2,877	6.3%	3,508	7.6%
West of I-75 Southbound Ramps	47,528	3,393	7.1%	3,792	8.0%
East of I-75 Northbound Ramps	37,077	2,832	7.6%	3,085	8.3%
West of Logan Boulevard	34,591	2,741	7.9%	2,936	8.5%
East of Logan Boulevard	20,360	1,711	8.4%	1,712	8.4%
Along Side Streets					
Meridian Plaza, east of Livingston Road	1,311	184	14.0%	119	9.1%
Livingston Road, north of Pine Ridge Road	26,217	2,338	8.9%	2,203	8.4%
Livingston Road, south of Pine Ridge Road	26,256	2,173	8.3%	2,260	8.6%
Whippoorwill Lane, south of Pine Ridge Road	12,635	965	7.6%	993	7.9%
Logan Boulevard, north of Pine Ridge Road	11,582	943	8.1%	1,095	9.5%
Logan Boulevard, south of Pine Ridge Road	25,448	1,955	7.7%	2,307	9.1%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was determined from FDOT Florida Traffic Online (2018) for the I-75 mainline and calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for the I-75 and Pine Ridge Road interchange. The D factor ranged from 67.3 percent to 76.6 percent during the AM peak hour along Pine Ridge Road, with a peak direction of west throughout. During the PM peak hour the D factors are not quite as extreme on Pine Ridge Road, but still high with an east peak direction. This indicates that Pine Ridge Road is used as a commuting facility towards Naples and the beaches in the morning and away from Naples and the beaches in the afternoon.

The directional distribution on I-75 compares well to the D factors found on Florida Traffic Online. I-75 to the north of Pine Ridge Road has a D factor of 56.5 percent during the AM peak hour and 57.0 percent during the PM peak hour, compared to a D factor of 56.4 percent on Florida Traffic Online. This particular count from Florida Traffic Online is a telemetered count and therefore there is confidence in the D factor value. I-75 to the south of Pine Ridge Road has a D factor of 57.5 percent during the AM peak hour and 57.3 percent during the PM peak hour, compared to a D factor of 55 percent on Florida Traffic Online. The D factors on I-75 south of Pine Ridge Road compare favorably to the Florida Traffic Online value. This count on Florida Traffic Online is a portable traffic monitoring site and a brief review of the associated synopsis report indicates that the D factor may be higher than 55.0 percent.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor**	Peak Direction
I-75 Mainline					
North of Pine Ridge Road	N/A*	N/A*	56.4%	56.5%	South
South of Pine Ridge Road	N/A*	N/A*	55.0%	57.5%	South
Along Pine Ridge Road					
West of Livingston Road	915	1,962	68.2%	67.5%	West
West of I-75 Southbound Ramps	1,127	2,266	66.8%	67.3%	West
East of I-75 Northbound Ramps	845	1,987	70.2%	71.4%	West
West of Logan Boulevard	662	2,079	75.8%	76.6%	West

Livingston Road, south of Pine Ridge Road	1,318	942	58.3%	57.8%	North
Whippoorwill Lane, south of Pine Ridge Road	486	507	51.1%	51.9%	South
Logan Boulevard, north of Pine Ridge Road	565	530	51.6%	51.8%	North
Logan Boulevard, south of Pine Ridge Road	1,061	1,246	54.0%	53.6%	South

*D Factor taken from Florida Traffic Online.
**Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used for the surface streets and 61.2 percent was used for the I-75 mainline.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T_{24}) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the only classification count collected as a part of this study effort on Pine Ridge Road, west of Logan Boulevard. This count was collected from February 19, 2019 to February 21, 2019. This table indicates that the T_{24} factor for Pine Ridge Road, west of Logan Boulevard is 6.1 percent. While Pine Ridge Road is not a major freight corridor, there are several commercial uses which would facilitate some truck traffic for deliveries. This is supported by the high proportion of trucks being classified as medium trucks.

Table 2.6: Field Measured Daily Vehicle Composition

Direction	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T_{24})		Buses	
		Count	%	Count	%	Count	%	Count	%
February 19, 2019									
Eastbound	16,802	1,025	6.1%	77	0.5%	1,102	6.6%	78	0.5%
Westbound	17,350	982	5.7%	28	0.2%	1,010	5.8%	24	0.1%
Two-Way	34,152	2,007	5.9%	105	0.3%	2,112	6.2%	102	0.3%

Two-Way	34,591	2,013	5.8%	99	0.3%	2,111	6.1%	97	0.3%

Table 2.7 summarizes the historical AADT and T_{24} factors for I-75, south of Pine Ridge Road and Pine Ridge Road, west of I-75. These are the two counts found on Florida Traffic Online which have classification counts within the study area. Daily truck percentages have been relatively stable during the past five years. Because AADT has increased overall during the past five years on I-75, the daily truck volume has also increased from 6,200 in 2014 to 7,800 in 2018. AADT on Pine Ridge Road has remained relatively flat despite a small spike in 2015 and 2016. The classification count collected on Pine Ridge Road, west of Logan Boulevard is slightly higher than the classification count obtained from Florida Traffic Online on Pine Ridge Road, west of I-75, although this difference is only about one percent.

Table 2.7: Historical AADT and T_{24} Factors

Year	I-75, South of Pine Ridge Road (COSITE = 032003)		Pine Ridge Road, West of I-75 (COSITE = 034628)		Livingston Road, North of Pine Ridge Road (COSITE = 034575)		Logan Boulevard, South of Pine Ridge Road (COSITE = 034155)	
	AADT	Daily Trucks (T_{24})	AADT	Daily Trucks (T_{24})	AADT	Daily Trucks (T_{24})	AADT	Daily Trucks (T_{24})
2018	76,500	9.5%	51,000	4.9%	26,000	4.7%	31,000	4.1%
2017	79,000	9.1%	51,500	4.3%	26,500	4.4%	28,500	4.8%
2016	72,500	9.3%	57,000	4.3%	25,500	3.8%	27,500	4.0%
2015	70,000	9.7%	56,000	4.6%	24,500	4.2%	28,500	4.0%
2014	64,000	9.3%	52,500	4.5%	23,500	4.2%	27,500	3.7%

The design hour truck (DHT) factor is the percentage of medium and heavy truck traffic during the peak hour. **Table 2.8** summarizes the 2019 AM peak hour volumes and truck volumes that were collected at the classification count on Pine Ridge Road, west of Logan Boulevard. According to the FDOT's *Project Traffic Forecasting Handbook (2019)*, DHT factor is estimated to be one half of the daily truck percentage. However, this table indicates that the vehicle composition during the AM peak hour is like the daily vehicle composition. Medium trucks make up around 6.1 percent of vehicles during the AM peak hour, compared to 5.8 percent of daily vehicles. Heavy trucks make up 0.3 percent of vehicles in both the AM peak hour and daily, and buses make up 0.2 percent of vehicles in the AM peak hour and 0.3 percent daily.

Table 2.8: Field Measured Peak Hour Vehicle Composition – AM Peak Hour

Direction	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (DHT)		Buses	
		Count	%	Count	%	Count	%	Count	%
February 19, 2019

Table 2.9 summarizes the same vehicle composition information, for the PM peak hour instead of the AM peak hour. The PM peak hour vehicle composition is again very similar to the daily vehicle composition and the AM peak hour composition. This, along with the higher composition of medium trucks compared to heavy trucks, indicates that much of the freight activity is related to service and delivery vehicles. Based on the observed daily, AM peak hour, and PM peak hour truck percentages, the truck percentages have remained relatively stable and the AM and PM peak hours do not differ significantly from each other or from the daily truck percentage.

Table 2.9: Field Measured Peak Hour Vehicle Composition – PM Peak Hour

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. **Table 2.10** provides the T_{24} and design hourly truck factor (DHT) for each of these locations.

Table 2.10: Design Truck Factors

Location	Count Site	T_{24}	DHT
I-75 mainline	032003	9.5%	5.0%
I-75 southbound off ramp	037024	7.5%	4.0%
I-75 southbound on ramp	037022	7.5%	4.0%
I-75 northbound off ramp	037021	7.5%	4.0%
I-75 northbound on ramp	037023	7.5%	4.0%
Pine Ridge Road	72-hour classification count	6.1%	4.0%
Cross Streets*	034575	4.7%	3.0%

*Design truck factor for cross streets is the maximum observed cross street truck factor from Florida Traffic Online

2.3 Existing Year (2019) Turning Movement Volumes

A review of the peak hour turning movement count data obtained at all study intersections and minor cross streets was reviewed within the area of influence for the previously defined AM and PM peak hours. Volumes were tied to origin-destination (OD) level trip patterns and balanced statistically utilizing data smoothing principles supported by the FDOT's *Project Traffic Forecasting Handbook (2019)* and the Transportation Research Board's *National Cooperative Highway Research Program Report 765: Analytical Travel Forecasting Approaches for Project-Level Planning and Design*. A detailed accounting of the statistical accuracy between the field collected turning movement volumes and the normalized existing conditions can be found in the *Existing Conditions Assignment Calibration Memorandum* in **Appendix C**. The adjusted existing year (2019) AM and PM peak hour volumes for the signalized intersections within the area of influence are graphically illustrated in **Figure 2.1**.

2.4 Existing Year (2019) AADT

Existing year (2019) AADT is calculated through the application of seasonal and axle correction factors applied to counted daily traffic as provided in **Figure 2.1** above. For any location where a count was not collected, AADT was derived from the application of the standard PTD (9.0 percent) to the maximum of the AM or PM bi-directional peak hour balanced volumes and then rounded. **Figure 2.2** shows the existing year (2019) AADT volumes for the I-75 and Pine Ridge Road study area.

Figure 2.1: Existing Year (2019) Turning Movement Volumes

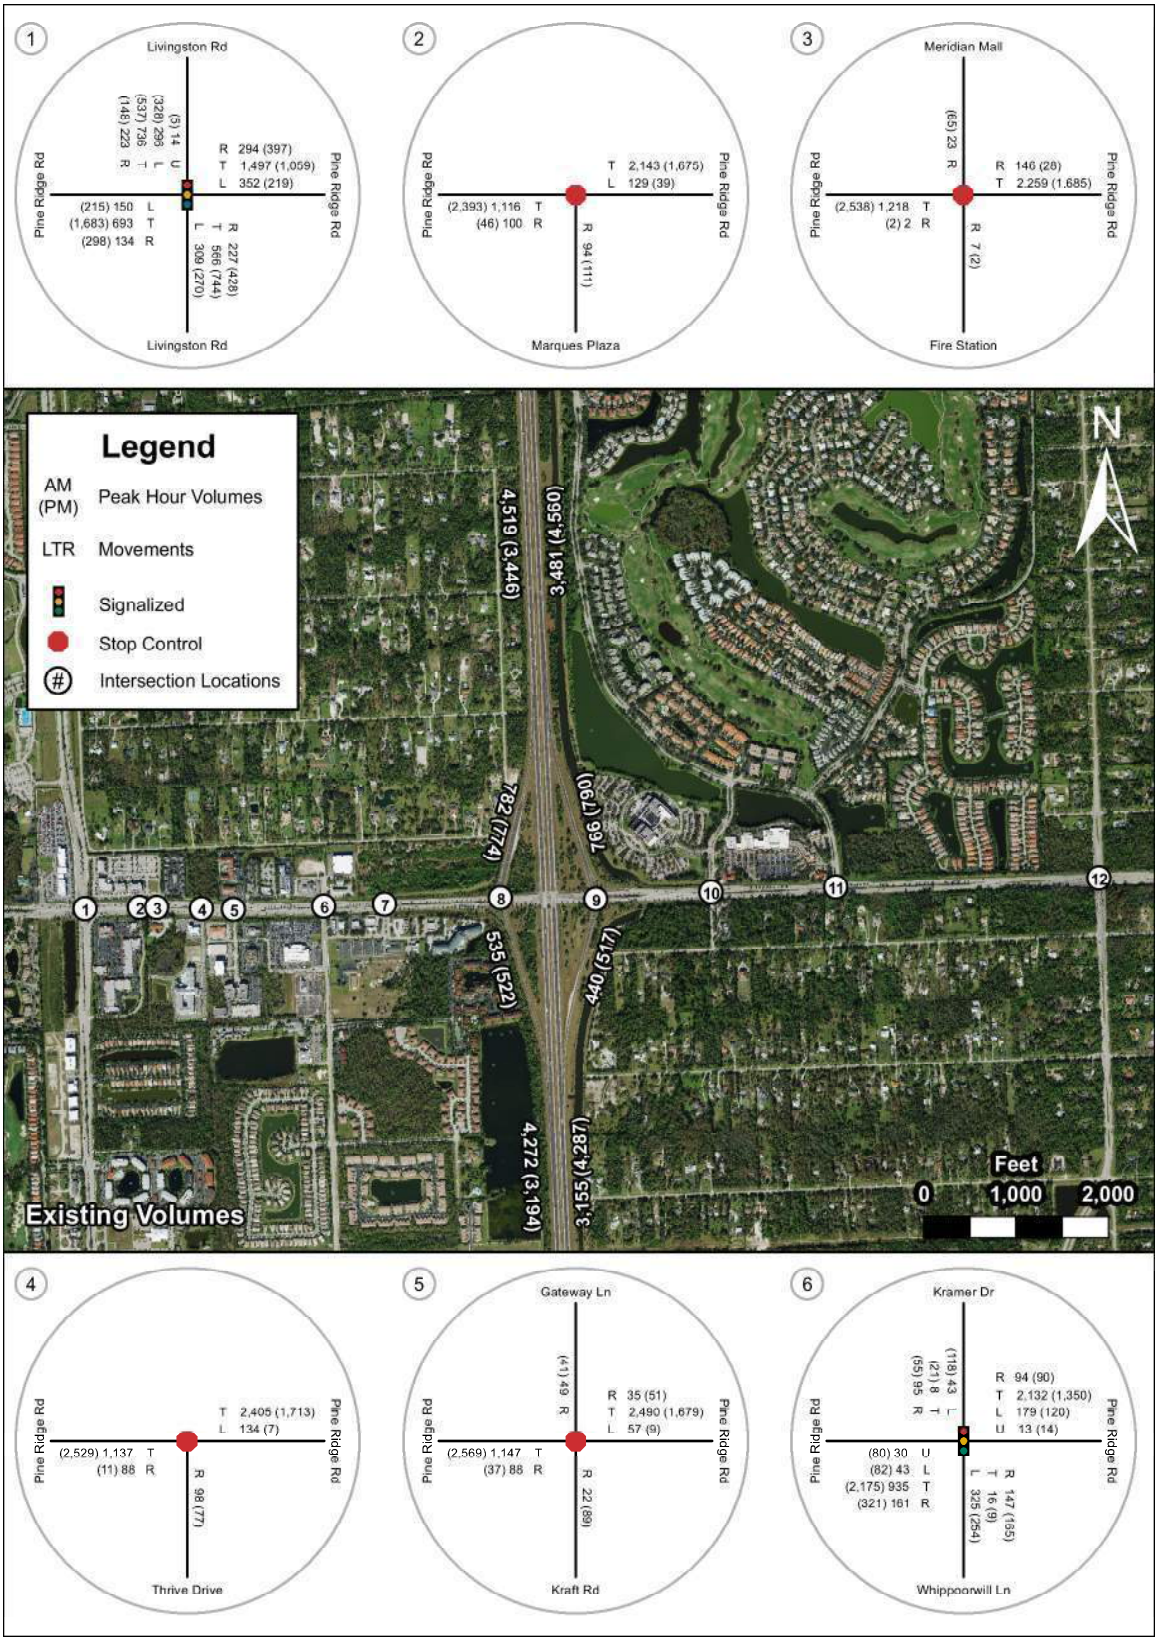

Figure 2.1 (continued): Existing Year (2019) Turning Movement Volumes

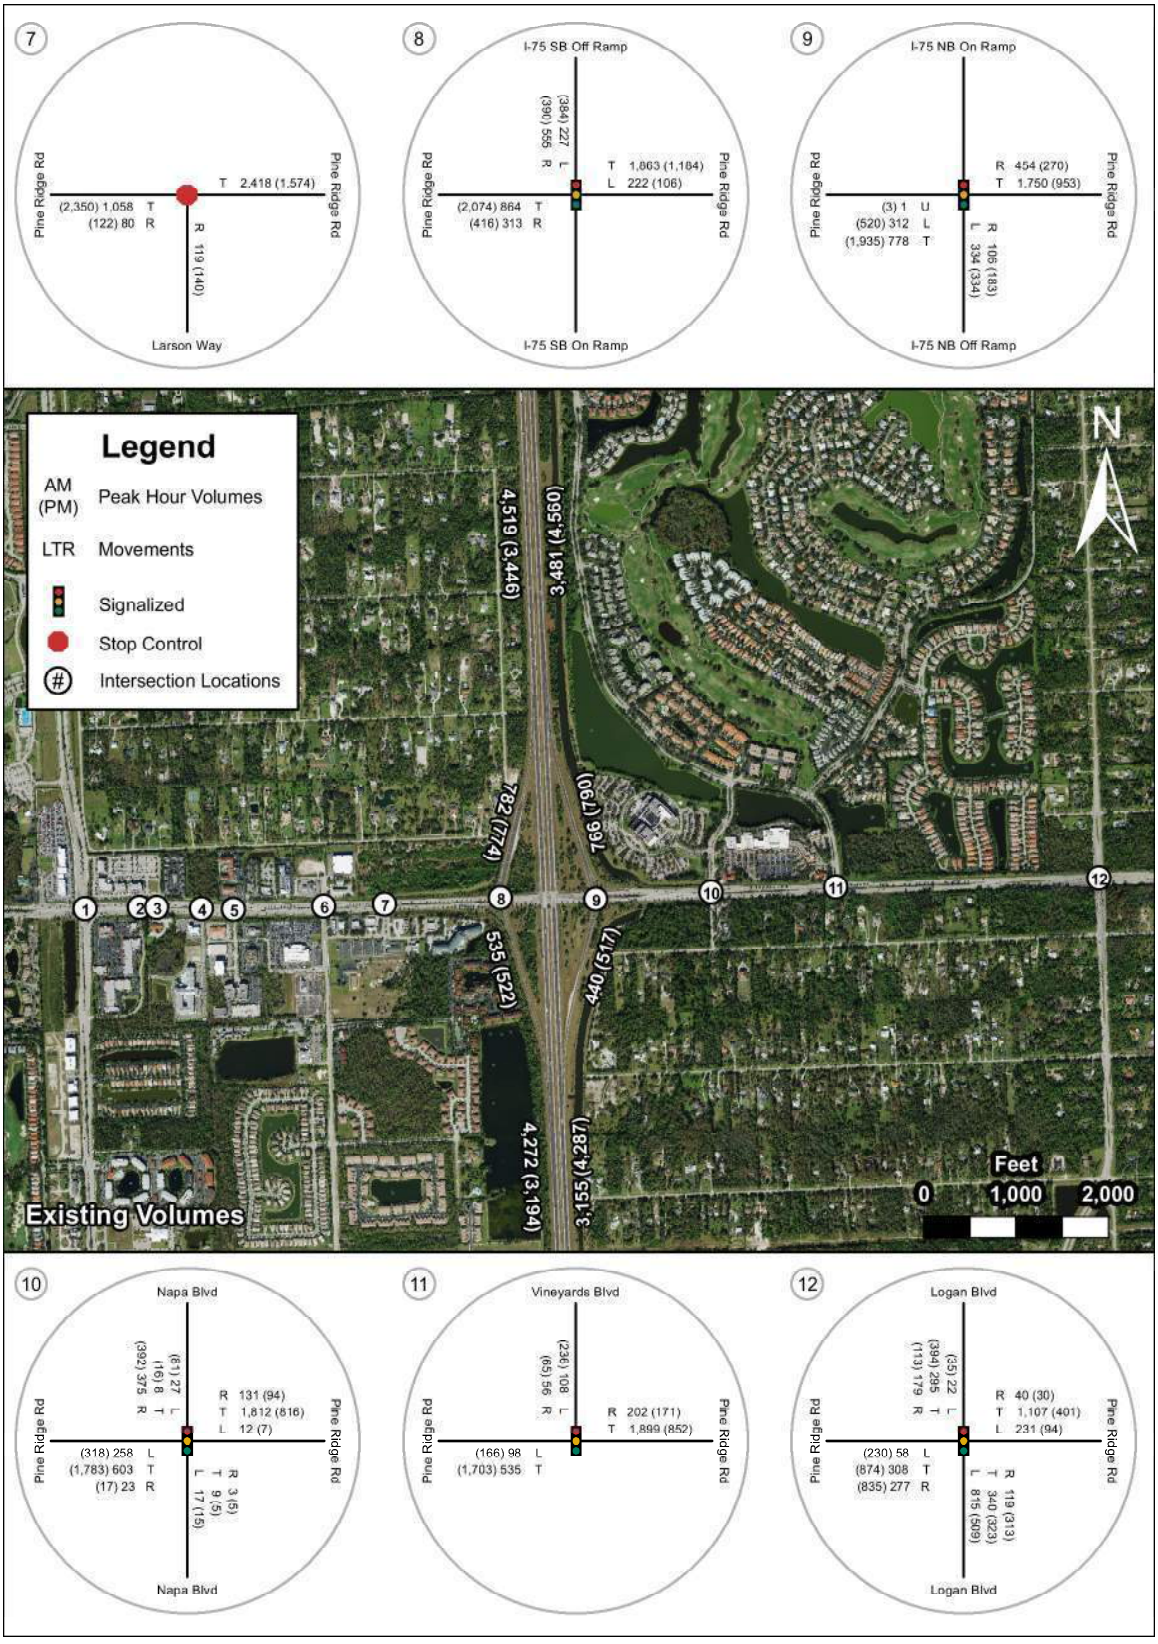

Figure 2.2: Existing Year (2019) AADT

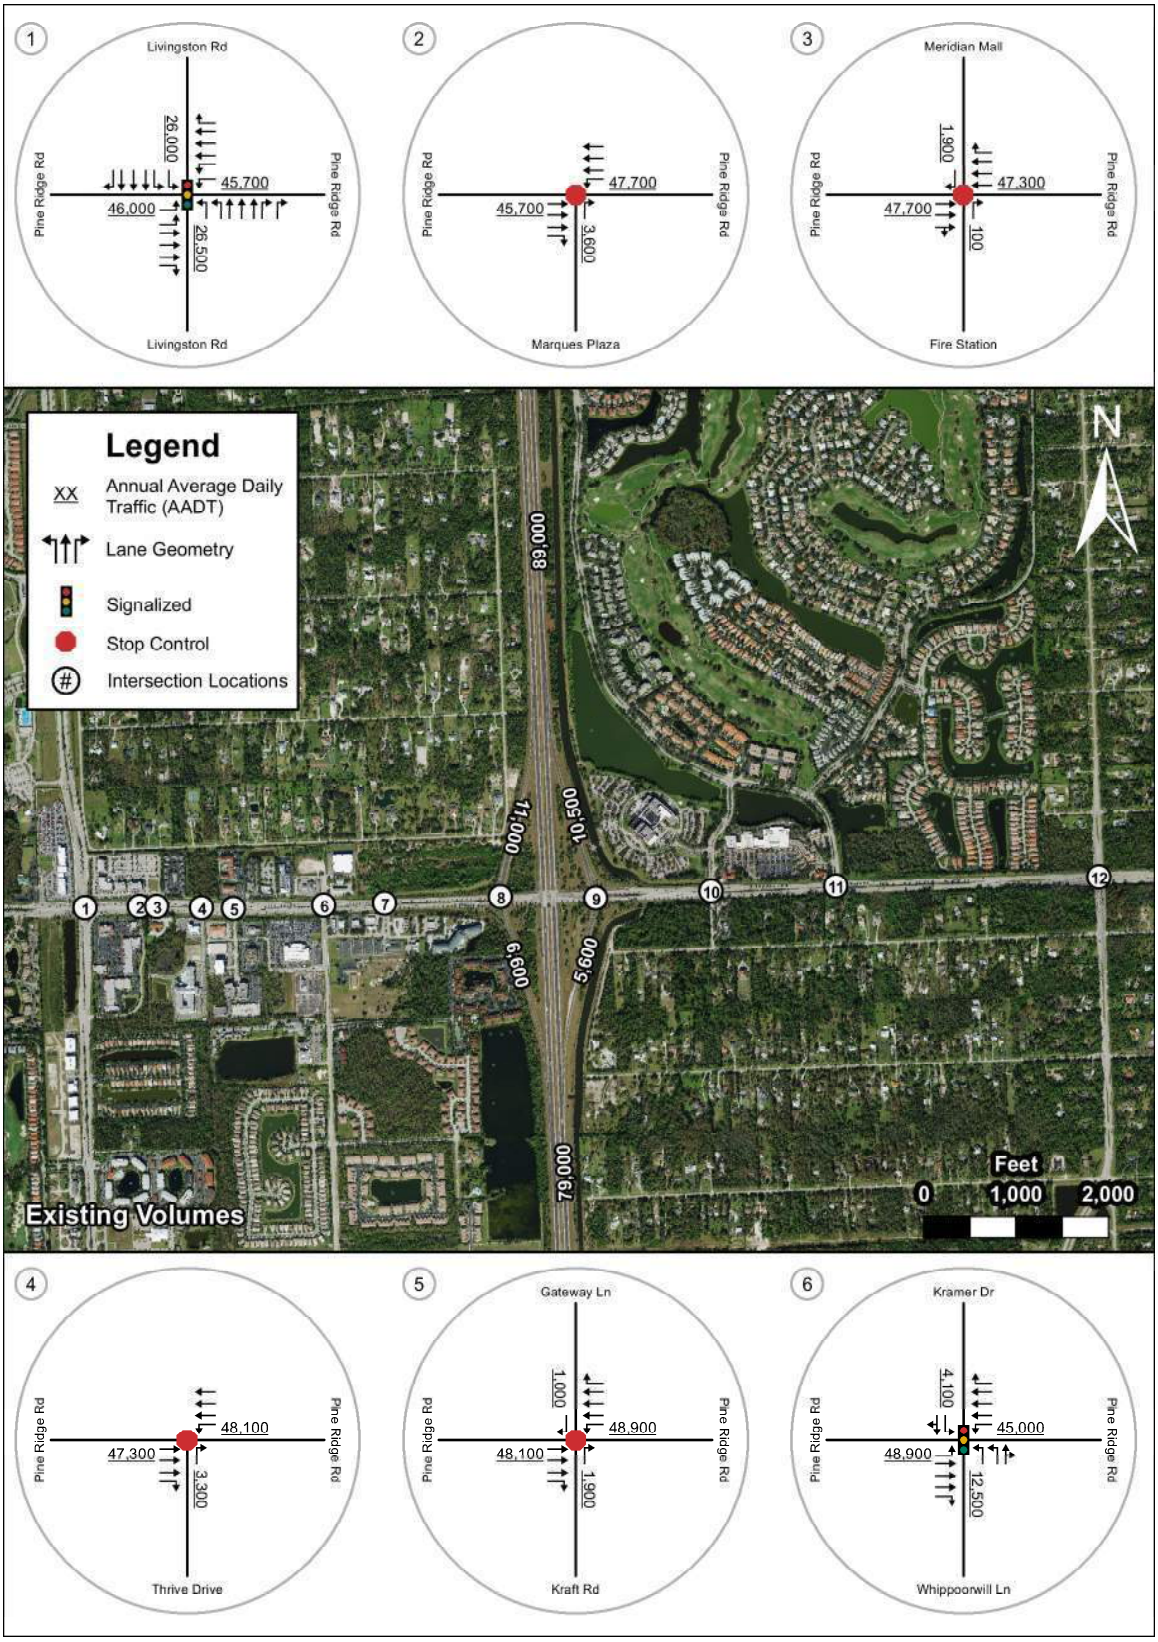

Figure 2.2 (continued): Existing Year (2019) AADT

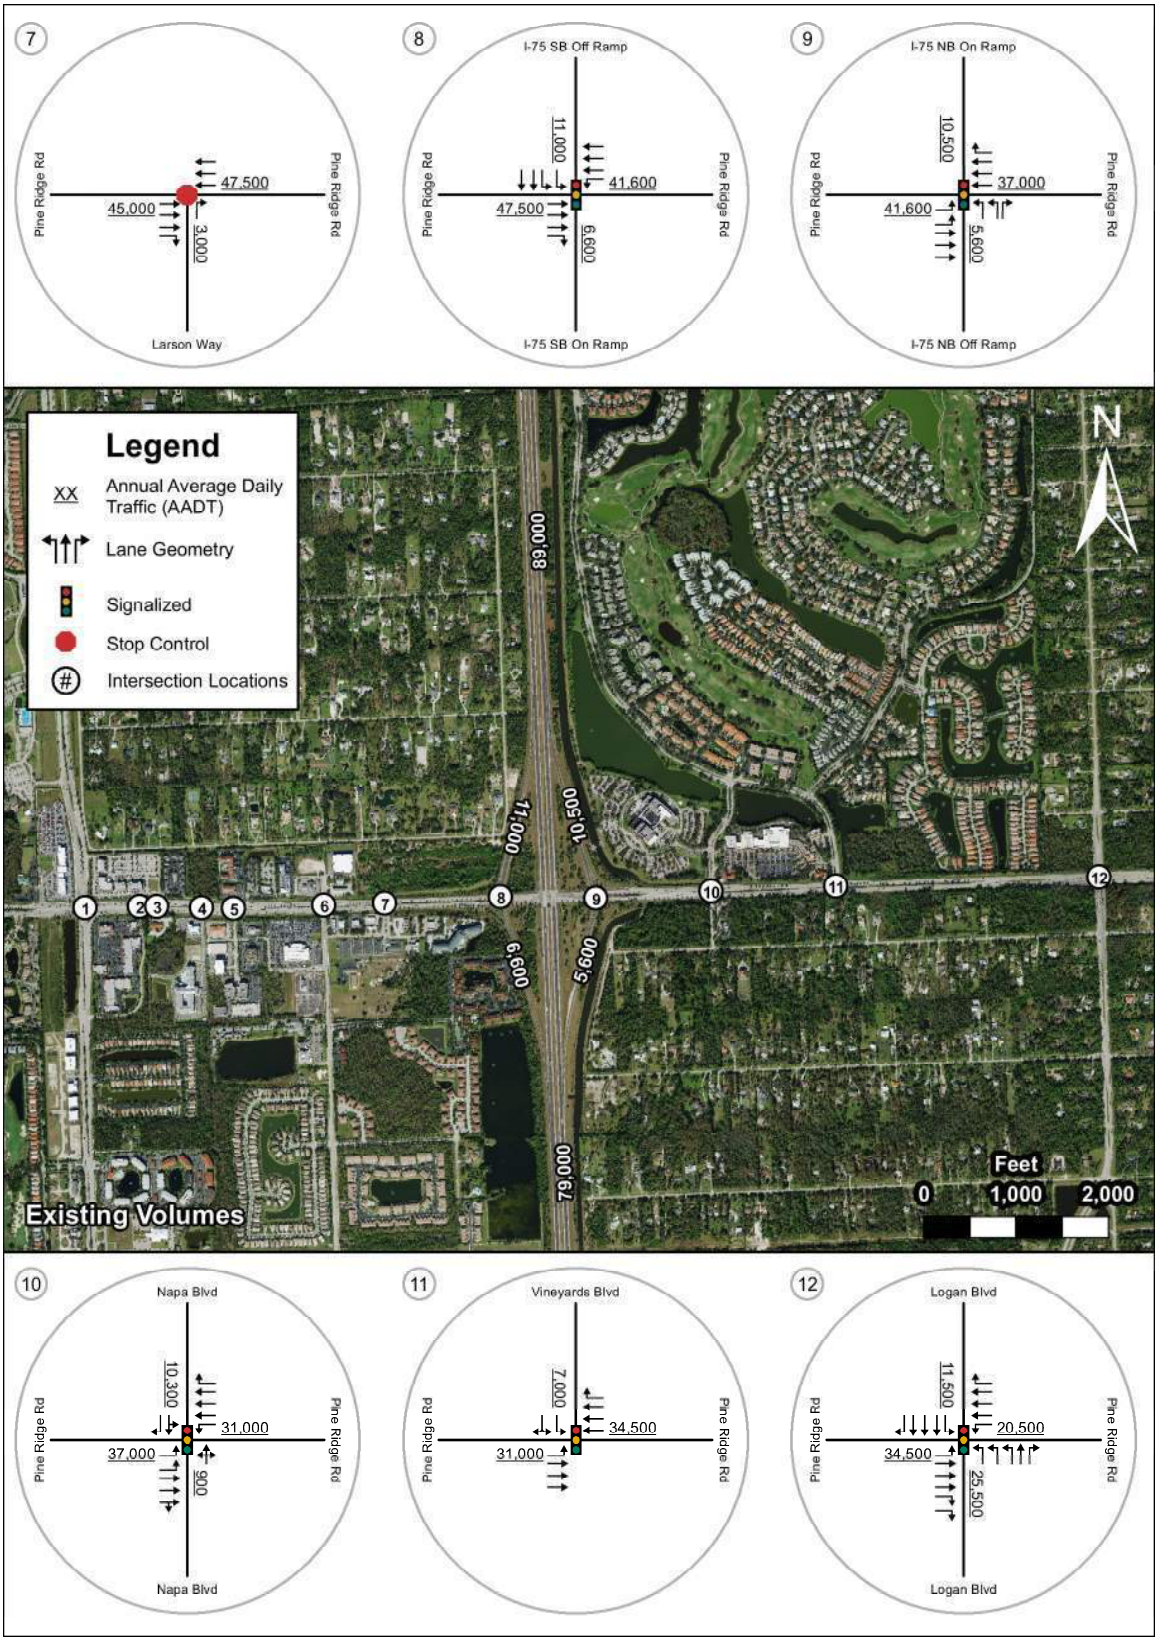

3.0 Development of Future Traffic

3.1 Design Year (2040) Growth Rate Development

Model outputs from the District 1 Regional Planning Model v 1.0.3 (D1RPM), which was provided by the Department and validated for the I-75 and Pine Ridge Road Interchange Study in May of 2018, were used to forecast volumes for the study area. The *Traffic Forecast Modeling Technical Memorandum* created for this validation can be found in **Appendix D**. The study area network was extracted from the model and network resolution was increased for forecasting and is illustrated in **Figure 3.1**.

For all corridor connections which correspond directly with a link in the D1RPM, the 2010 to 2040 growth rate was reviewed for reasonableness and used directly where possible to grow the existing year (2019) AADT.

For corridor connections that were identified as residential or business access driveways, the growth rate was limited to 0.5 percent which corresponds to the University of Florida's Bureau of Economic and Business Research (BEBR) "low growth" in population for Collier County through 2045. This was used to avoid very high growth rates in relatively low volume locations where significant growth is not expected.

For corridor connections that do not correspond directly to a model link but represent local roads not accounted for in the D1RPM network, a weighted average interchange area annual growth rate of 1.7 percent was applied. This weighted average interchange area annual growth rate was derived from growth rates extracted from surface streets within the D1RPM Pine Ridge Road subarea.

As a final check for excessively high model growth, particularly on low volume links, the link growth rates were compared to BEBR high forecast for population growth in Collier County through 2045 of 2.5 percent annual growth. In the event of significant model growth, further examination of model volumes was conducted to ensure that these high growth rates were rational.

After all the AADTs at external links to the study corridor were forecasted, the number of trips entering and exiting this closed system were balanced to ensure no loss of trips. As a conservative approach, trips were always balanced upwards. **Table 3.1** summarizes the forecasts at the peripheral links along the corridor. While the ramps to and from I-75 are not external to the study area network and are therefore not used directly in the forecasting procedure, they are provided in **Table 3.1** for informational purposes only to show how the ramps will grow.

Figure 3.1: VISUM Model Network

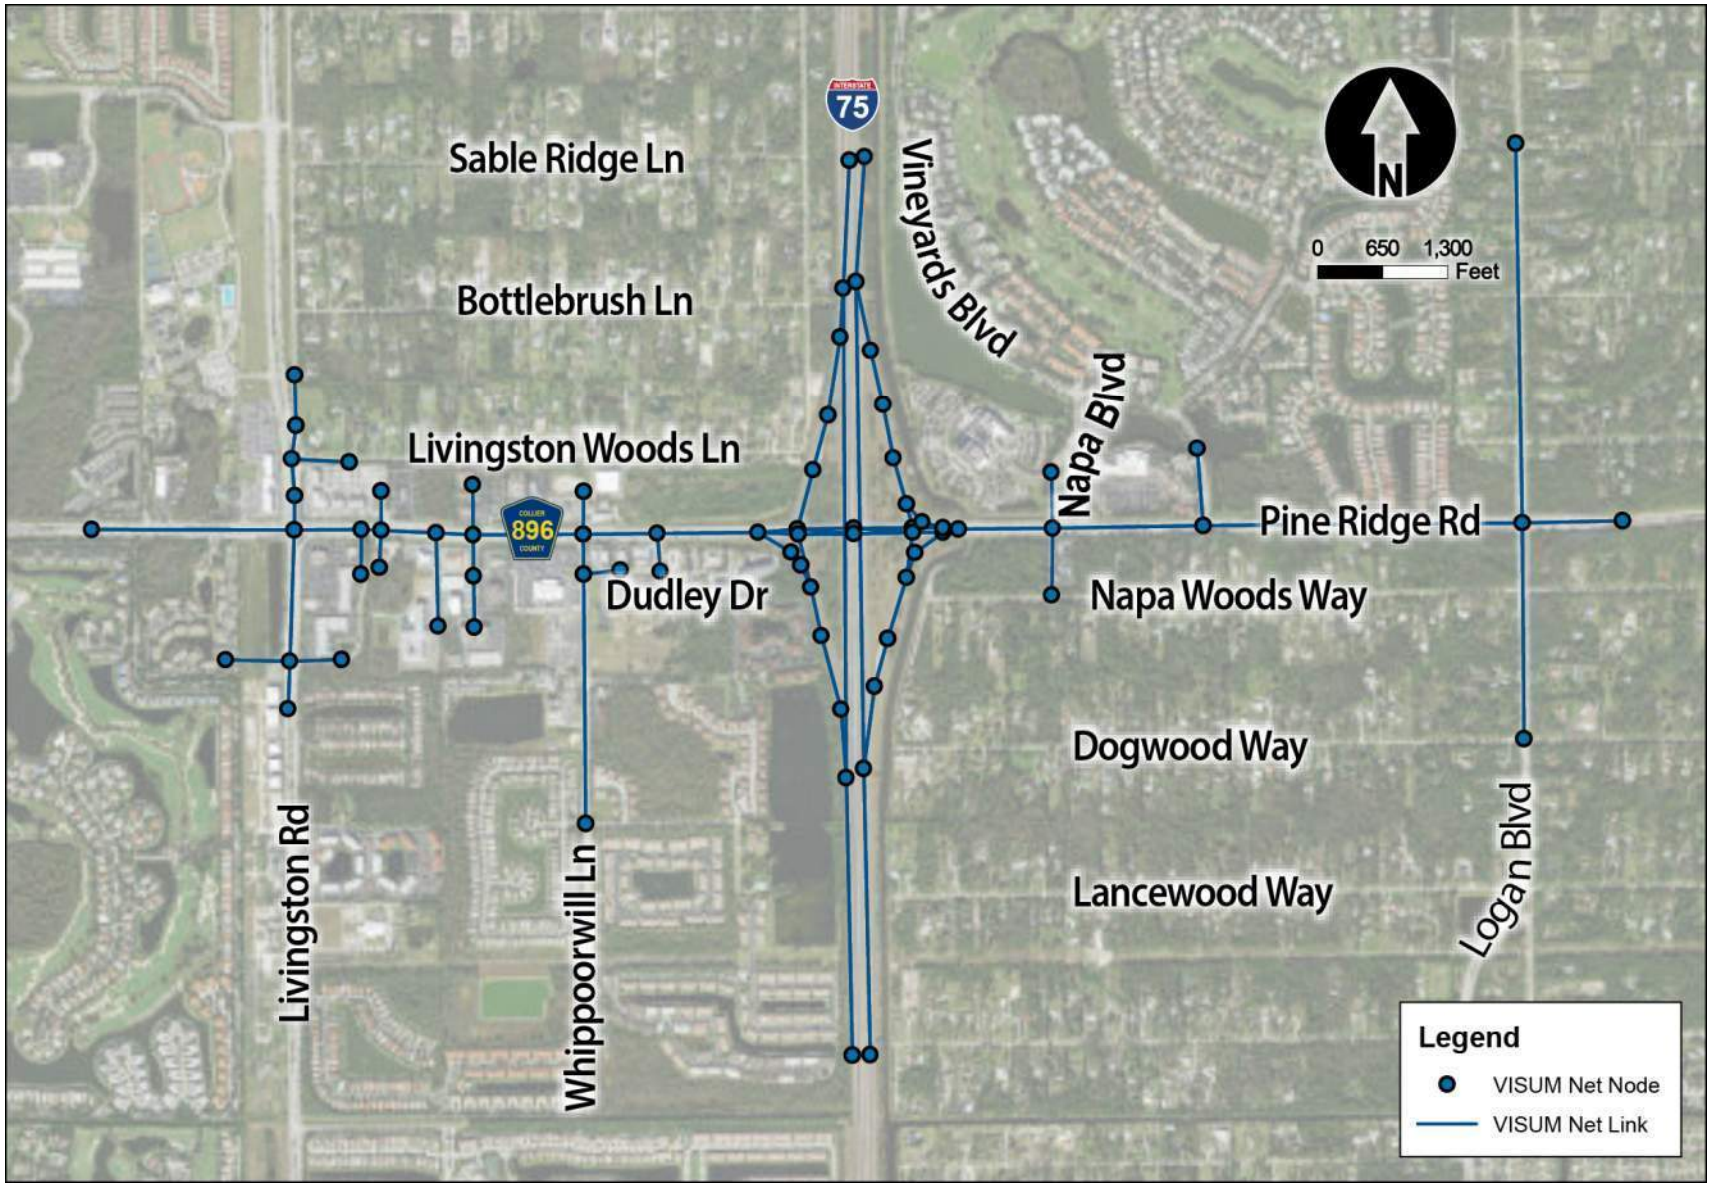

Table 3.1: Forecasts of External Network Links

Location	Model Outputs			Existing 2019 AADT	2040 AADT
	2010 AADT	2040 AADT	Annual Growth		
I-75 Mainline

*Business/Residential Access or Negative Model Growth- BEBR 'Low' growth rate of 0.5% used.
**Local Road non-driveway - D1RPM interchange area surface street weighted average growth rate of 1.7% used.
***I-75 Ramps to/from Pine Ridge Road are included as informational items only. These are not external links to the network and are not used as direct inputs to the forecasting procedure.

3.2 Design Year (2040) Peak Hour Volumes

The design year (2040) AM and PM peak hour volumes were developed utilizing the calibrated existing VISUM network for the study area as documented in the *Traffic Methodology Statement* included in **Appendix B** of this report. Initial AADTs developed through the forecasting process, outlined previously, were used in conjunction with the standard K factors, D-factors, and truck percentages discussed in **Section 2.0**, to assign demand to the network. The resultant network input peak hour volumes can be found in **Table 3.2**.

These input peak hour volumes were assigned to the network using a user-equilibrium assignment procedure. The resulting assignment was checked for the reasonableness between the existing year (2019) and design year (2040) by ensuring both the OD relationship and intersection level turning movements either remained the same or increased over time. Any resulting growth at either the OD or movement level was compared against the interchange level growth for reasonableness. Turning movement volumes were extracted from this assignment at each of the study intersections. Design year (2040) AADT and AM and PM peak hours turning movement volumes are shown in **Figure 3.2** and **Figure 3.3**.

Figure 3.2: Design Year (2040) AADT

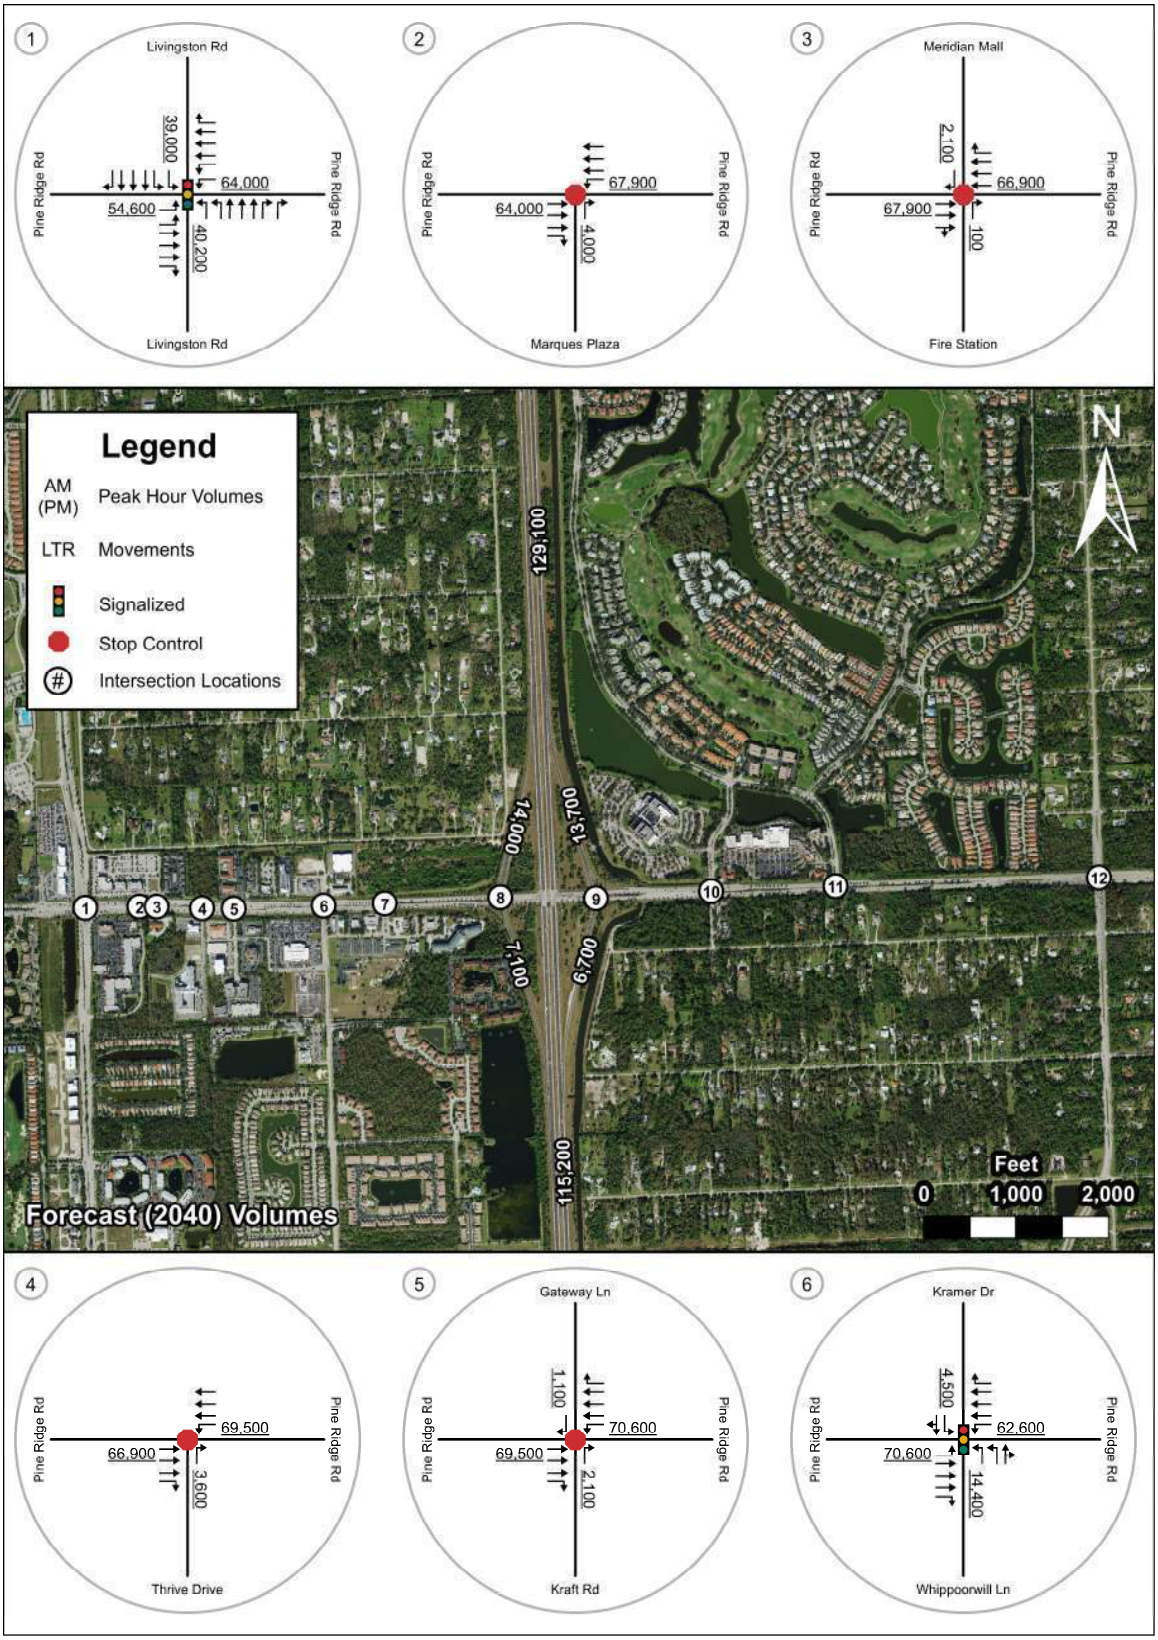

Figure 3.2 (continued): Design Year (2040) AADT

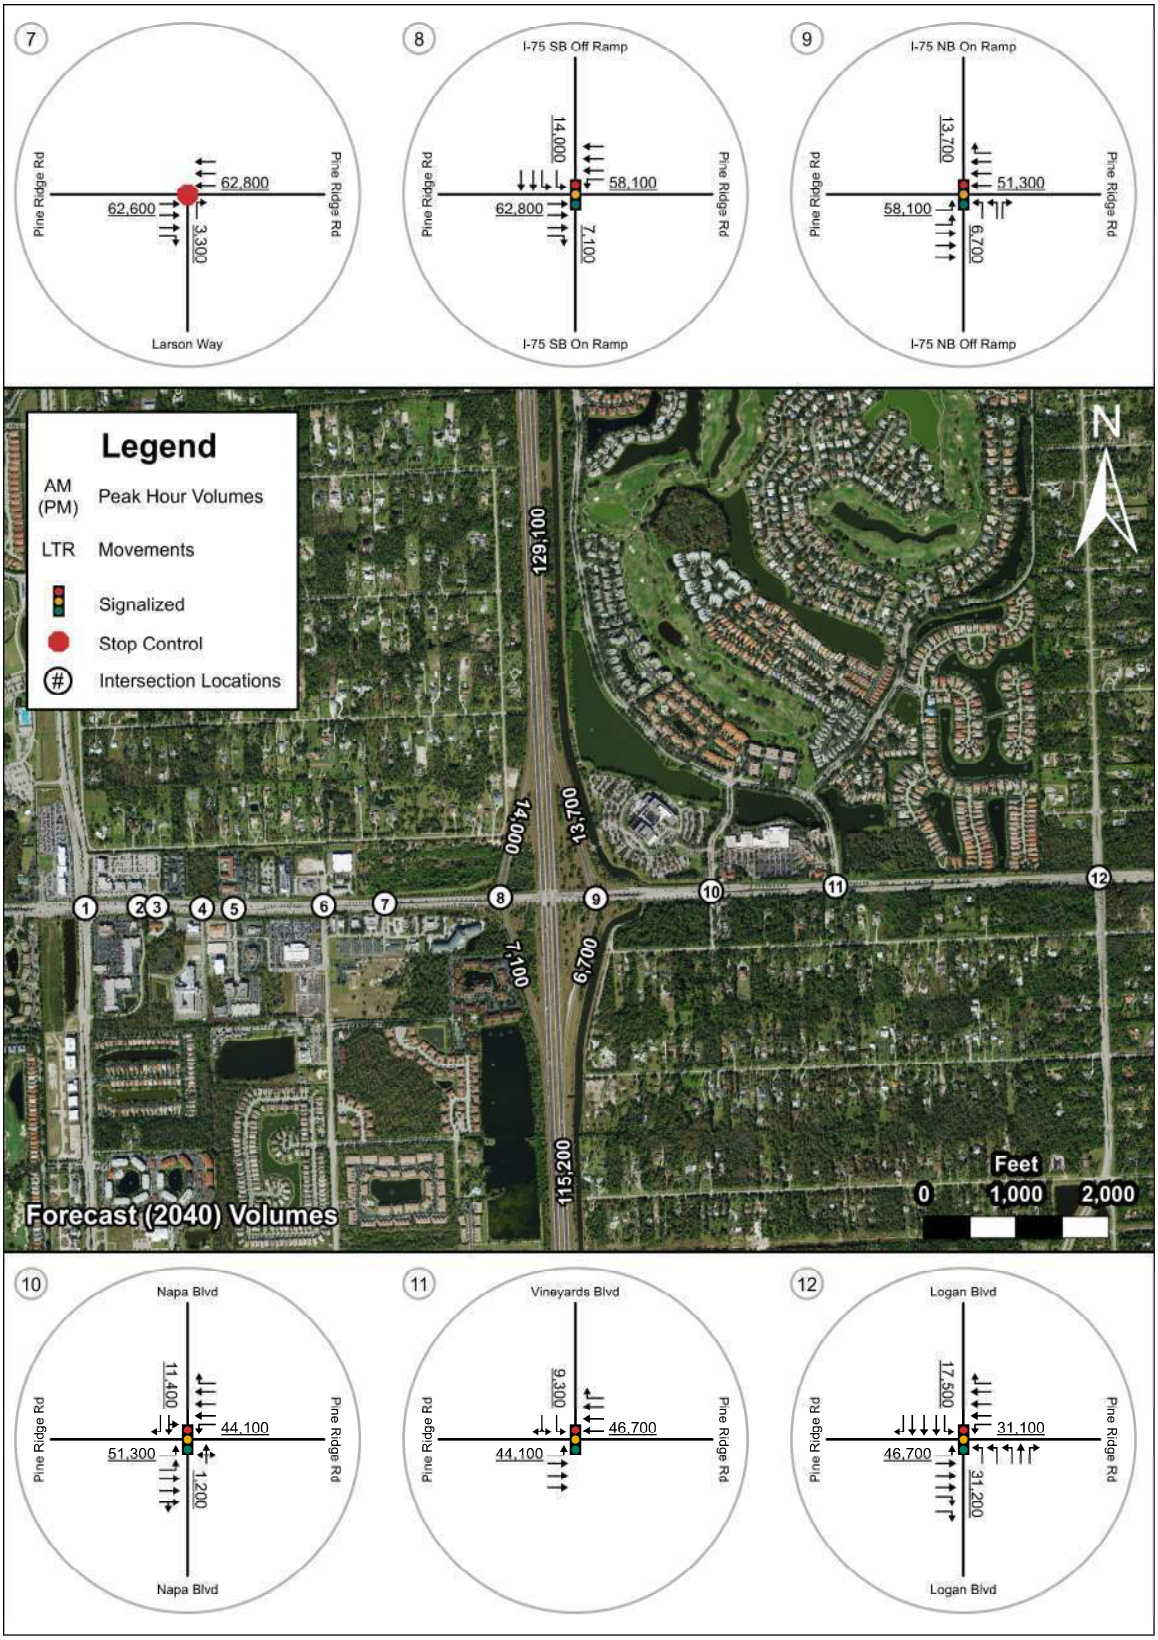

Figure 3.3: Design Year (2040) Turning Movement Volumes

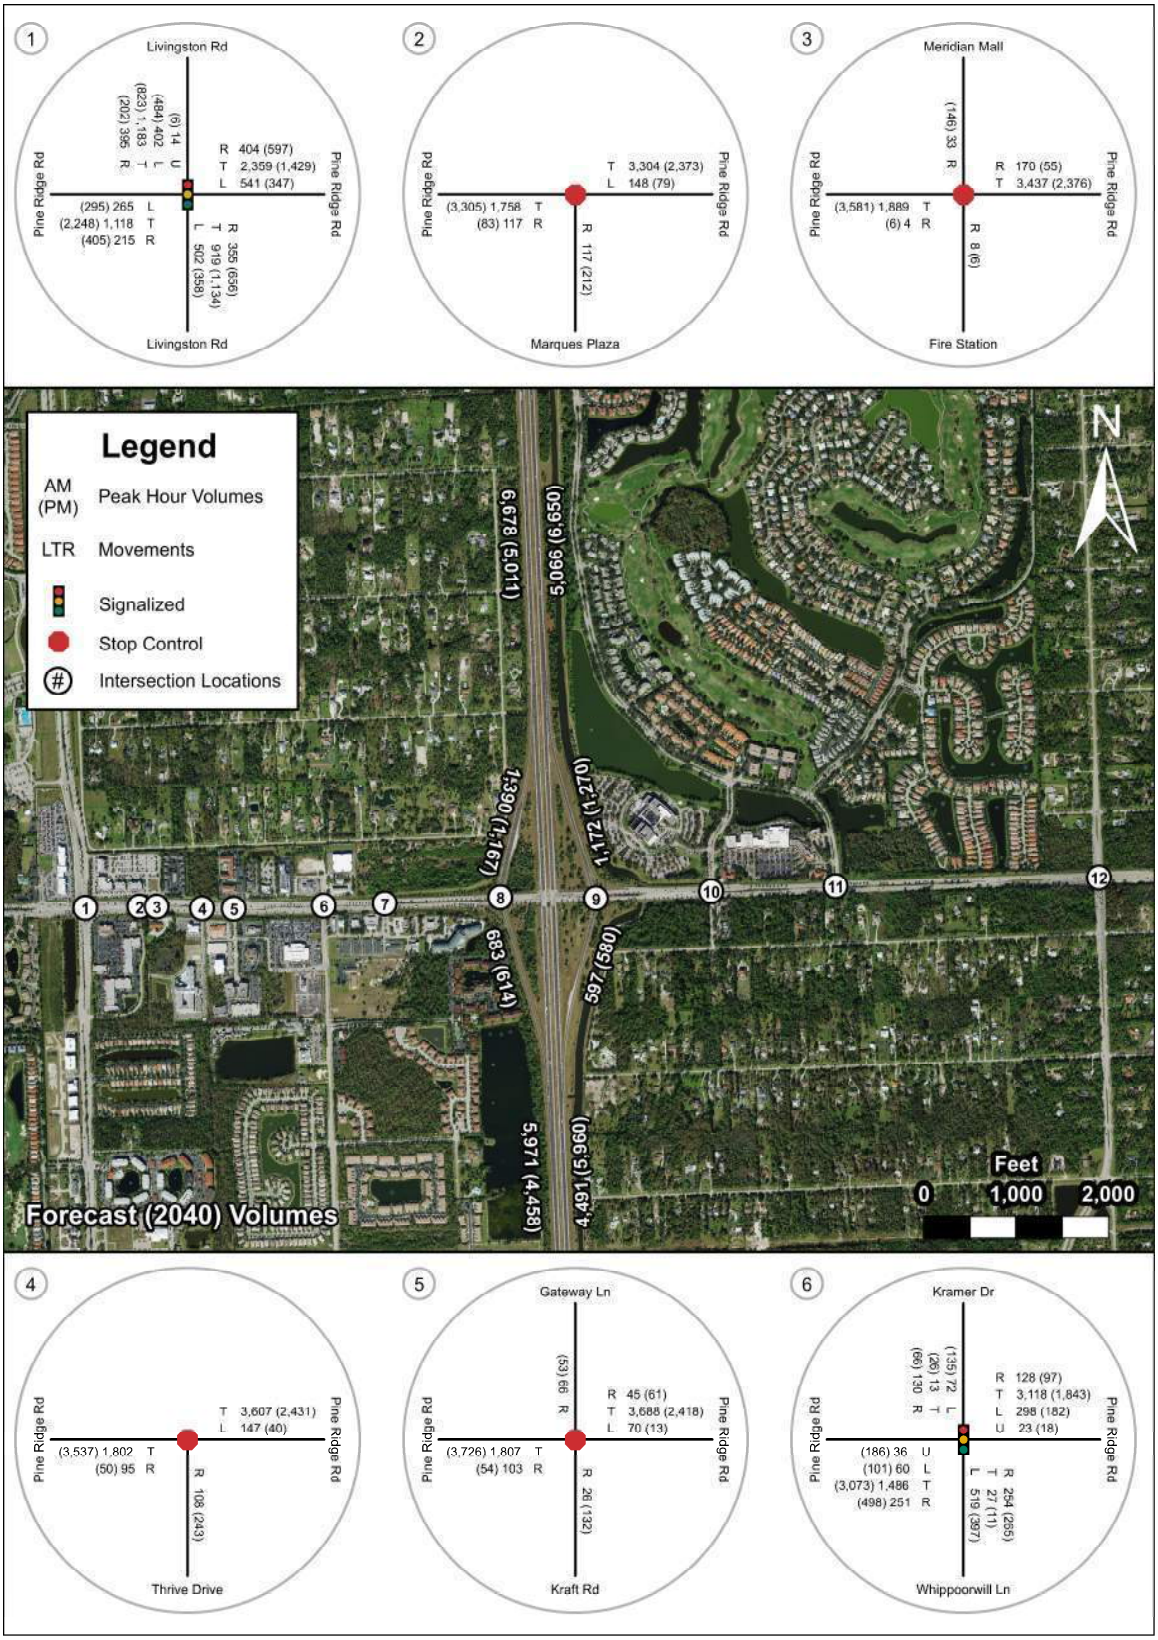

Figure 3.3 (continued): Design Year (2040) Turning Movement Volumes

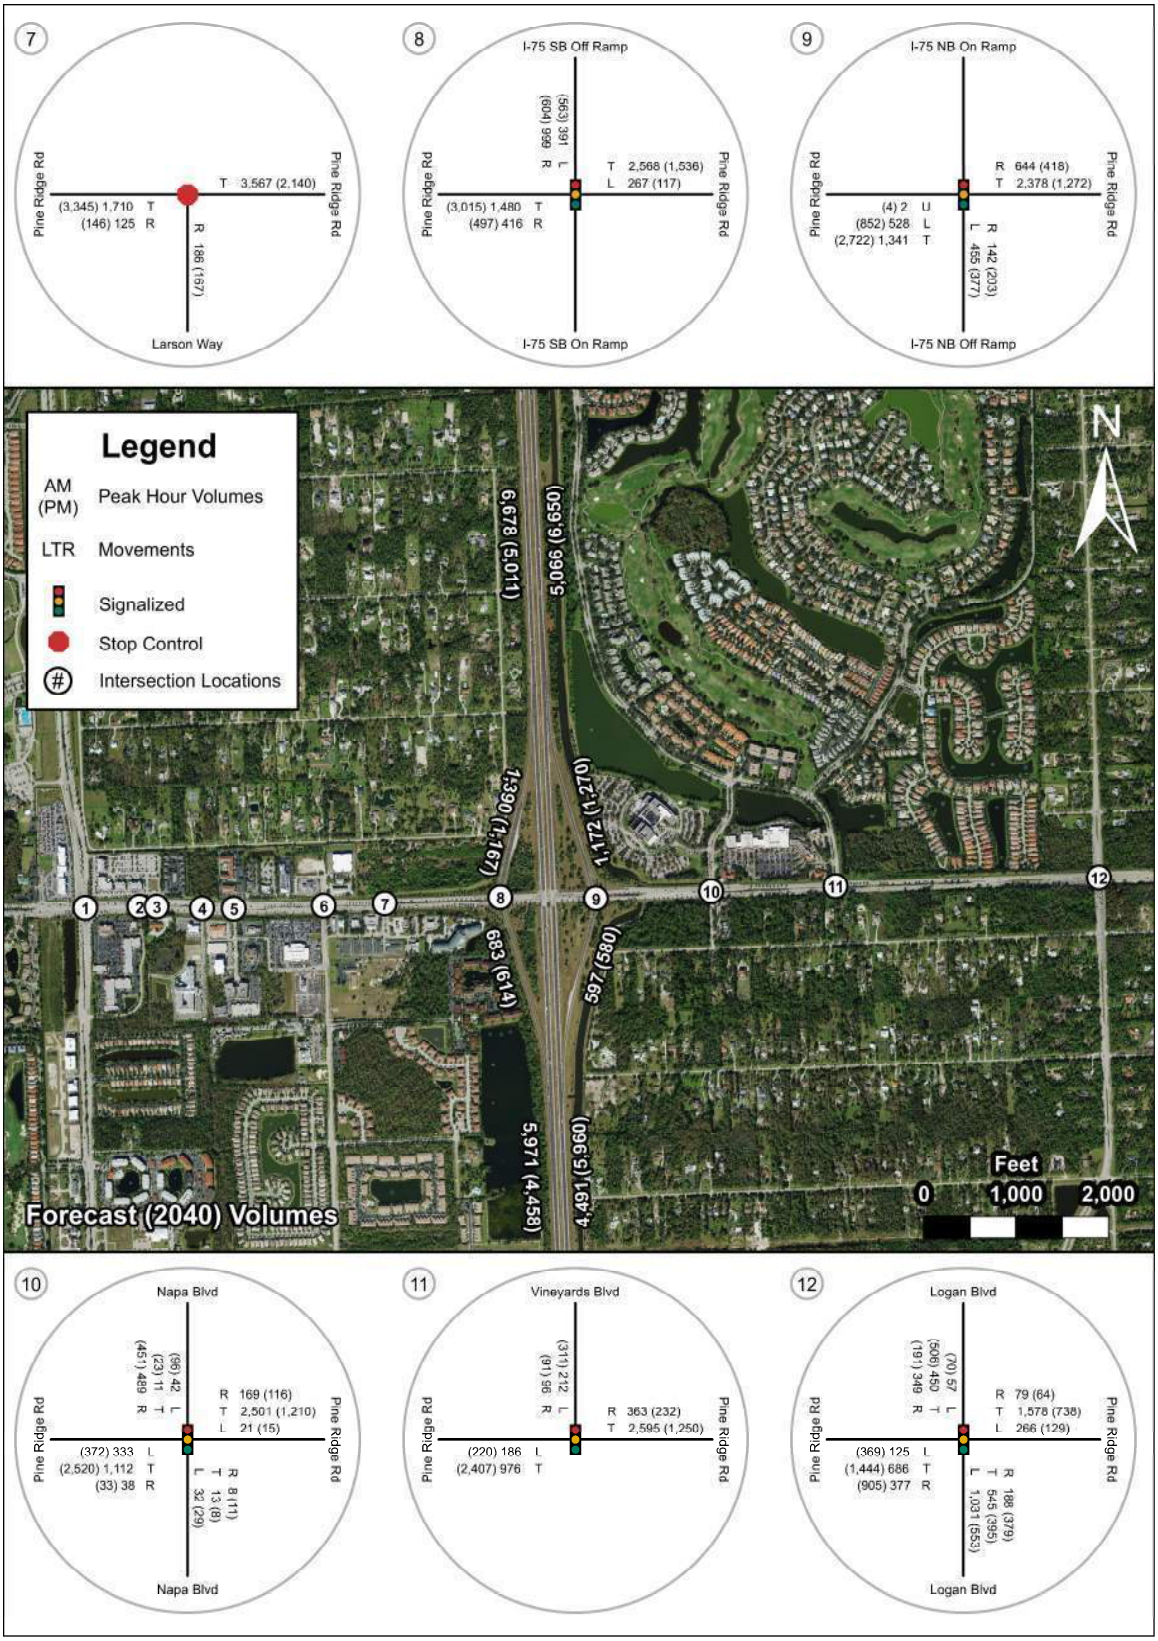

As an additional check for distribution accuracy, D factors were recalculated from the design year (2040) turning movement volumes, at locations where 72-hour count data was originally collected, to compare them to the existing year (2019) D factors. This comparison is summarized in **Table 3.3** and **Table 3.4**, respectively. As evident by the results, network assignment has provided flexibility by allowing various OD relationships and movements to grow dynamically while still reflecting reasonable directionality. This is particularly evident within the interchange area where significant peak direction characteristics and directionality were maintained.

Table 3.3: Design Year (2040) D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	2019 D Factor	2040 D Factor*	Peak Direction

*Resulting D Factor after volume balancing procedures were conducted.

3.3 Opening Year (2025) Traffic Volumes

Opening year (2025) peak hour volumes were subsequently derived by interpolating between the existing year (2019) and design year (2040) peak hour volumes at the network periphery. The volumes were then again assigned utilizing the calibrated VISUM network. The resulting opening year (2025) AADTs and turning movement volumes can be found in **Figures 3.4** and **3.5,** respectively.

Figure 3.4: Opening Year (2025) AADT

MEMORANDUM

Date: August 3. 2020
To: Joshua Jester EXT 2251

From: Brittany Nichols, Traffic Analyst/RCI Coordinator
Subject: Financial Project No: 445296-1-22-01
Roadway ID: 03175000
Project Name: I-75 South of Pine Ridge Road
County: Collier
Type of Work: Reconstruction – Interchange Improvements
From MP: 55.940 – 56.280

Per your request, the attached traffic data forecasts are provided for the above roadway. These estimates were taken from the 2045 AADT PDF calculated from traffic counts provided by FDOT.

K =	9.0 %
D =	55.0 %
24 Hour T =	10.2 %
Design Hour T =	5.1 %
2019 AADT =	79000
Functional Class =	Urban Prin Arterial Int.

The attached 18-KIP Equivalent Single Axle Loading Accumulations are based on the above information and have been prepared in accordance with the Central Offices memo of December 1, 2000, reflecting the current Equivalency Factors.

As requested, we have included the 24-hour traffic count for site 032003.

Please feel free to contact Brittany Nichols at extension 2753 if you have any questions.

Opening to Mid-Design Year ESAL Accumulation (1000s): 9122

Opening to Design Year ESAL Accumulation (1000s): 19581

I have reviewed the 18 kip Equivalent Single Axle Loads (ESAL's) to be used for pavement design on this project. I hereby attest that these have been developed in accordance with the FDOT Project Traffic Forecasting Procedure using historical traffic data and other available information.

Tallahassee, FL 32399-0450

KEVIN J. THIBALT, P.E.
SECRETARY

MEMORANDUM

Date: **August 3. 2020**
To: **Joshua Jester** **EXT 2251**

From: **Brittany Nichols, Traffic Analyst/RCI Coordinator**
Subject: **Financial Project No: 445296-1-22-01**
Roadway ID: 03175000
Project Name: I-75 North of Pine Ridge Road
County: Collier
Type of Work: Reconstruction – Interchange Improvements
From MP: 56.280 – 56.628

Per your request, the attached traffic data forecasts are provided for the above roadway. These estimates were taken from the 2045 AADT PDF calculated from traffic counts provided by FDOT.

K	=	9.0 %
D	=	56.4 %
24 Hour T	=	8.0 %
Design Hour T	=	4.0 %
2019 AADT	=	89215
Functional Class	=	Urban Prin Arterial Int.

The attached 18-KIP Equivalent Single Axle Loading Accumulations are based on the above information and have been prepared in accordance with the Central Offices memo of December 1, 2000, reflecting the current Equivalency Factors.

As requested, we have included the 24-hour traffic count for site 030191.

Please feel free to contact Brittany Nichols at extension 2753 if you have any questions.

18 kip EQUIVALENT SINGLE AXLE LOAD ANALYSIS

PROJECT TRAFFIC FOR PD&E and DESIGN ANALYSIS INFO / FACTORS

FIN #: 445296-1-52-01
COUNTY: Collier
ROADWAYID: 03175000
PROJECT DESCRIPTION: Reconstruction - Interchange Improvements

LOCATION #: 2

LOCATION DESCRIPTION: I-75 North of Pine Ridge Rd (MP: 55.94 - 56.628)

Opening to Mid-Design Year ESAL Accumulation (1000s): 7891

Opening to Design Year ESAL Accumulation (1000s): 16911

I have reviewed the 18 kip Equivalent Single Axle Loads (ESAL's) to be used for pavement design on this project. I hereby attest that these have been developed in accordance with the FDOT Project Traffic Forecasting Procedure using historical traffic data and other available information.

Tallahassee, FL 32399-0450

KEVIN J. THIBALT, P.E.
SECRETARY

MEMORANDUM

Date: **August 3. 2020**
To: **Joshua Jester** **EXT 2251**

From: **Brittany Nichols, Traffic Analyst/RCI Coordinator**
Subject: **Financial Project No: 445296-1-22-01**
Roadway ID: 03175009
Project Name: I-75 NB off ramp to Pine Ridge Road
County: Collier
Type of Work: Reconstruction – Interchange Improvements
From MP: 0.000 – 0.348

Per your request, the attached traffic data forecasts are provided for the above roadway. These estimates were taken from the Method Letter of Understanding (MLOU) calculated from traffic counts provided by FDOT.

K = 9.0 %
D = 99.9 %
24 Hour T = 7.5 %
Design Hour T = 3.75 %
2019 AADT = 5500
Functional Class = Active Exclusive (Interstate Ramp)

The attached 18-KIP Equivalent Single Axle Loading Accumulations are based on the above information and have been prepared in accordance with the Central Offices memo of December 1, 2000, reflecting the current Equivalency Factors.

As requested, we have included the 24-hour traffic count for site 037021.

Please feel free to contact Brittany Nichols at extension 2753 if you have any questions.

MEMORANDUM

Date: August 3. 2020
To: Joshua Jester EXT 2251

From: Brittany Nichols, Traffic Analyst/RCI Coordinator
Subject: Financial Project No: 445296-1-22-01
Roadway ID: 03175015
Project Name: I-75 NB on ramp from Pine Ridge Road
County: Collier
Type of Work: Reconstruction – Interchange Improvements
From MP: 0.000 – 0.390

Per your request, the attached traffic data forecasts are provided for the above roadway. These estimates were taken from the 2045 AADT PDF calculated from traffic counts provided by FDOT.

K =	9.0 %
D =	99.9 %
24 Hour T =	7.5 %
Design Hour T =	3.75 %
2019 AADT =	11500
Functional Class =	Active Exclusive (Interstate Ramp)

The attached 18-KIP Equivalent Single Axle Loading Accumulations are based on the above information and have been prepared in accordance with the Central Offices memo of December 1, 2000, reflecting the current Equivalency Factors.

As requested, we have included the 24-hour traffic count for site 037023.

Please feel free to contact Brittany Nichols at extension 2753 if you have any questions.

MEMORANDUM

Date: August 3. 2020
To: Joshua Jester EXT 2251

From: Brittany Nichols, Traffic Analyst/RCI Coordinator
Subject: Financial Project No: 445296-1-22-01
Roadway ID: 03175011
Project Name: I-75 SB on ramp from Pine Ridge Road
County: Collier
Type of Work: Reconstruction – Interchange Improvements
From MP: 0.000 – 0.364

Per your request, the attached traffic data forecasts are provided for the above roadway. These estimates were taken from the 2045 AADT PDF calculated from traffic counts provided by FDOT.

K =	9.0 %
D =	99.9 %
24 Hour T =	7.5 %
Design Hour T =	3.75 %
2019 AADT =	6500
Functional Class =	Active Exclusive (Interstate Ramp)

The attached 18-KIP Equivalent Single Axle Loading Accumulations are based on the above information and have been prepared in accordance with the Central Offices memo of December 1, 2000, reflecting the current Equivalency Factors.

As requested, we have included the 24-hour traffic count for site 037022.

Please feel free to contact Brittany Nichols at extension 2753 if you have any questions.

MEMORANDUM

Date: **August 18. 2020**

To: **Joshua Jester** **EXT 2251**

From: **Brittany Nichols, Traffic Analyst/RCI Coordinator**

Subject: **Financial Project No: 445296-1-22-01**

Roadway ID: 03504000

Project Name: Pine Ridge Road west of I-75

County: Collier

Type of Work: Reconstruction – Interchange Improvements

From MP: 3.140 – 3.809

Per your request, the attached traffic data forecasts are provided for the above roadway. These estimates were taken from the 2045 AADT PDF calculated from traffic counts provided by FDOT.

K =	9.0 %
D =	62.1 %
24 Hour T =	6.1 %
Design Hour T =	3.05 %
2019 AADT =	47500
Functional Class =	Urban Minor Art.

The attached 18-KIP Equivalent Single Axle Loading Accumulations are based on the above information and have been prepared in accordance with the Central Offices memo of December 1, 2000, reflecting the current Equivalency Factors.

As requested, we have included the 24-hour traffic count for site 034526 & 034628.

Please feel free to contact Brittany Nichols at extension 2753 if you have any questions.

MEMORANDUM

Date: **August 18. 2020**

To: **Joshua Jester** **EXT 2251**

From: **Brittany Nichols, Traffic Analyst/RCI Coordinator**

Subject: **Financial Project No: 445296-1-22-01**

Roadway ID: 03504000

Project Name: DDI Core under I-75 overpass

County: Collier

Type of Work: Reconstruction – Interchange Improvements

From MP: 3.140 – 3.809

Per your request, the attached traffic data forecasts are provided for the above roadway. The estimated numbers used were collected and projected as a part of the project and provided by the consultant project manager: Nicole Harris (Nicole.Harris@stantec.com).

K =	9.0 %
D =	65.7 %
24 Hour T =	6.1 %
Design Hour T =	3.05 %
2019 AADT =	41600
Functional Class =	Urban Minor Art.

The attached 18-KIP Equivalent Single Axle Loading Accumulations are based on the above information and have been prepared in accordance with the Central Offices memo of December 1, 2000, reflecting the current Equivalency Factors.

Please feel free to contact Brittany Nichols at extension 2753 if you have any questions.
