Under 334-5.9.5 Defective Material...I don't think it's a good ideal to completely eliminate the PC test data from the EAR process...if I am reading that correctly...even if it did not compare with the IV test results all data should be considered as part of the review.

Yes sir, they currently use the PC data as part of the delineation/EAR. For instance, if the AC failed they still look at the gradations and other characteristics. Or air voids, they still look at the PC data such as AC or gradations. Even when I complete a delineation we sample from good PC sample to good PC sample. PC test really help us on the material limits because a pay sample might be from the day before. I believe PC test must/needs to be used for any engineering analysis or delineation procedures
