TABLE 2 NOTES
See Table 8 for Reinforcing Schedule.

## GENERAL NOTES

1. Standard structure bottoms $4^{\prime}-0^{\prime \prime}$ diameter and smaller (Alt. A) and $3^{\prime}-6^{\prime \prime}$ square (Alt. B) are designated Type P. Larger standard structure bottoms are designated Type J. Risers are permitted for all structures. Round risers are designated Type A, square risers are designated Type B.
2. Walls of circular structures (Alt. A) constructed in place may be of brick or reinforced concrete. Precast and rectangular structures (Alt. B) shall be constructed of reinforced concrete only.
3. Wall thickness and reinforcement are for either reinforced cast-in-place or precast concrete units except that precas circular units may be furnished with walls in accordance with ASTM C478 (see modified wall thicknesses in Table 1).
4. Top and bottom slab thickness and reinforcement are for precast and cast-in-place construction. All concrete shall be of Class II concrete, except use Class IV concrete when shown in the Plans, for special applications of structures located in extremely aggressive environments. Concrete as specified in ASTM C478 (4000 psi) may
5. All reinforcement shown is Grade 60 steel, deformed bar. Equivalent area Grade 40 steel or equivalent area smooth deformed welded wire reinforcement in accordance with Specification Section 931 may be substituted according to Index No. 201, unless otherwise noted.
6. Alt. A or Alt. B structure bottoms may be used in conjunction with curb inlet tops Types 1, 2, 3, 4, 5, 6, 9, and 10, and any manhole or junction box unless otherwise shown in the plans or other standard drawings. Alt. B structure bottom may be used in conjunction with curb inlet Types $7 \& 8$ or any ditch bottom inlet unless otherwise shown in the plans or other standard drawings.
7. Rectangular structures may be rotated as directed by the Engineer in order to facilitate connections between the structure walls and storm sewer pipes.
8. Except when ACI hooks are specifically required, reinforcement in top and bottom slab shall be straight embedment.
9. All reinforcement must have $2^{\prime \prime}$ minimum cover except for $3^{\prime \prime}-6^{\prime \prime}$ diameter precast circular units manufactured under ASTM C478, keyed construction otherwise shown. Additional bars used to restrain hole formers for precast structures with grouted pipe connections,may be left flush with the hole surface. Cut or bend reinforcement at pipe openings to maintain cover. Exposed ends of reinforcing at precast pipe openings and grouted joints must be removed to $1^{\prime \prime}$ below the concrete surface and sed
10. The corner fillets shown are necessary for rectangular structures used with circular risers and inlet throats and when used on skew with rectangular risers, inlets and inlet throats. Fillets will be required in the top slab of the Alt. A structure bottoms when used with the Alt. B risers. Each fillet shall be reinforced with two \#5 bars.
11. Inlet walls, throats, risers or manhole tops shall be secured to structures as shown on Index No. 201 (Sheet 3 of 5) Optional Construction Joints.
12. Structures with depths over 14 below the mean high water table are to be checked for flotation by the designer of the drainage project.
13. Units larger than specified standards may be substituted at the contractor's option when these units will not cause or increase the severity of utility conflicts. Such larger units shall be furnished at no additional cost to the Department. Larger Alt. A units cannot replace Alt. B units without approval of the Engineer. This note applies to this Index only.
14. For manhole and junction box tops, for frames and covers, and, for supplementary details and notes see Index No. 201
15. Type I structure bottoms must have a minimum $6^{\prime}-0^{\prime \prime}$ wall height when possible, for maintenance access.

SLAB AND WALL DESIGN table NOTES

1. Size is the inside dimension(s) of a structure.
2. Slab reinforcement is appropriate for top, intermediate, and
bottom slabs. bottom slabs.
3. Bottom Slabs for precast $3^{\prime}-6^{\prime \prime} \times 3^{\prime}-6^{\prime \prime}$ rectangular structures at $15^{\prime}$ depth or less, may be $6^{\prime \prime}$ thick.
4. Slab depth is measured from finished grade to top of slab.
5. Wall depth is measured to the top of the bottom slab for boxes and to the top of the intermediate slab for risers.
6. Wall height is the distance between top of lower slab to bottom of upper slab. Maximum wall height is $12^{\prime}$ for wall
lengths exceeding $5^{\prime}$, or $10^{\prime}$ for wall lengths exceeding 12'.

7. Wall lengths exceeding $6^{\prime}-0^{\prime \prime}$ require two layers of reinforcing
(See Table 8) with $2^{\prime \prime}$ of cover from the horizontal bars to the inside and outside faces for each layer
8. Wall lengths exceeding the dimensions or depths shown in Table 8, or $12^{\prime}-0^{\prime \prime}$ diameter require a special design.
9. Wall thickness and reinforcing for rectangular structures is he same for both long and short sides.
10. Reinforcing schedules with larger areas of steel may be substituted for schedules with smaller bar or wire spacing, except that Schedule B10 may not be substrur spacing adjustments when larger areas of reinforcing are substituted

Wall designs - Rectangular structures (table 8)
