COMMENTS:

There were some requirements for NTSS-1h that are incorrect. Sieve Test: delete conditions (not relevant) and requirement should be 0.01 max. Particle charge should be deleted as it is not relevant

RESPONSE:

Formatting and test requirements were reviewed and addressed.

For CRS-1h: The test requirement for sieve test was reformatted to “maximum 0.10%”.

For NTSS-1hm: The test condition for sieve test was removed as not relevant, and note (a) moved to apply to the test requirement. The test requirement for particle charge was removed as not relevant. Based on lab testing of representative samples of the product, and input from the supplier the following test requirements were changed: Saybolt Furol Visc.: 20-500 seconds. Residue by Distillation: minimum 50%. Sieve Test: maximum 0.30%. Penetration: maximum 20.
