**Comments**

This specification references use of incandescent lamps for the signal display. Since LED-display technology is the state-of-the-art at this point in time, it is recommended that the portion referencing incandescent lamps be replaced with verbiage requiring (or at least permitting) use of LEDs. The proposed specification is essentially a material specification for a traffic signal device that is subject to certification by the Department. Once certified, the device will be added to the Department's approved products list (APL). In consideration of this discussion, it is believed that this specification should more appropriately be added to the minimum specification for Traffic Control Signal Device (MSTCD), as opposed to the standard specifications.

**Response**

**We do not want to make these changes at this time.**  
**We will consider these recommendations in the future, we need to do some more research.**
