Note that this document contains a number of strike-thru items for which the old and new values are the same (example, 781-3.1.3.3). Are these items intended to be revised?

We are revising our previous review comment: We have had issues with 7810100 ITS – Motorist Information Systems. If the system is wireless and a message is sent out to activate the beckons wireless they may activate other nearby HAR beckons. Example: if a message is sent out to south bound I-95 it could activate the northbound HARs as well or in a case of an interchange like I-95 and I-595 the message could activate the I-595 HARs. This does not happen if the system is connected by fiber.
