Do you want to consider adding “resolution” language in case the Engineer’s verification tests fail?

Response: No, the specification addresses the resolution. No changes made.

We need to remove the profiled baseline requirements as there is no product available on the QPL. Due to several test deck failures, this product is not capable of meeting the requirements spelled out in Specifications 701 and 971 and will not be available anytime soon for further consideration.

Response: I agree with you but eliminating the alternative will need to go through industry review. I will propose a change for the next workbook to address this issue. No changes made at this time.

(comment from Ronda Daniell)

I would like to suggest that under the 701 specification change that the department consider adding the audible line (Rumble line from the 518 standard index ( this is in a draft format as of now and we have to get permission to use it) as a viable audible bump) with a thermo line.

Response: We plan to include this in the next cycle since it will require specification and design standard modifications. No changes made at this time.
