

CAUTION

Assembly of anchorage and installation of tendons shall only be performed by qualified post-tensioning specialist personnel.

This installation procedure is generic; follow the specific procedure for each project and the FDoT specifications.

SECTION B-B
top injection and venting

SECTION A-A
front injection and venting

DETAIL C

INSTALLATION

1. Preassemble anchor (AN) and plastic trumpet (PT), (some silicone grease shall be used to facilitate the threading and the compression of the gasket).
2. Bolt the assembled AN to the pocket former using the two threaded holes located on the front surface of AN. AN shall be placed perpendicular to the tendon's axis and rotated such as the side grout hole points up.
3. The position of the spiral rebar (SR) shall be secured to the AN or to adjacent rebar by tack-welding or proper fixing. The SR shall be rotated such that it won't interfere with 3/4" NPT pipe attachment (if using side grout hole). Align axis of SR with AN. Seal unused port in AN.
4. Install the duct as shown on shop drawings and insert it into PT and seal it with duct by heat shrink sleeve (or, if not possible, with heat shrink wrap) in order to prevent concrete from penetrating.
5. Carry out the pressure test.

Concreting can now proceed.

6. After completion of concrete placement, remove the pocket former and prove that duct is clear of any obstructions or damage and that all grout vents are free and secured.
7. Install strands by pushing or pulling individually or as a bundle into duct. Allow sufficient extra length at the active anchorage for stressing. The strand threading can be completed before or after the concrete is poured.
8. Check the wedge plate (WP) for rust and dirt, clean wedge holes with wire brush if necessary. Lightly grease or oil wedge holes.
9. Check wedges for rust. Discard rusty wedges and use only clean ones.
10. Install wedge plate (keeping up the inspection hole), slip the wedges over the strands and securely place them into wedge holes.
11. Do not apply post-tensioning forces until the concrete mean compressive strength f_{ci} is not less than the values shown on the spiral table. These values refer to cylindrical strength.

Stressing can now proceed.

[!] Appropriate clearance must be kept behind the hydraulic jack while stressing.

12. Stressing operation shall be executed according to the engineer form and requires the simultaneous reading of pressure and elongation. Check the conformity of the final elongations measurement with prescribed values.
 13. Install the protection cap (PC) with O-ring sealing on AN using six bolts (some silicone grease shall be used to facilitate the compression of the O-ring).
 14. Thread 1/2" NPT pipe for grout onto the PC and the 3/4" NPT pipe for grout onto AN. Use a 1/2" plug to secure the hole on PC not used. (Some thread seal tape shall be used to improve the tightness of the threadings).
 15. Carry out the pressure test.
- Grouting can now proceed.
16. Grout shall be injected through the filler inlet until it escapes from the filler outlet. Special measures shall be applied for long tendons, for tendon paths with distinct high points or inclined tendons to avoid voids.
 17. All vents and grouting inlets/outlets have to be sealed with plugs soon after grouting.
 18. Fill holes with non-shrink grout after post grouting operation and inspection are completed.

BILL OF MATERIALS

ITEM	PART #	DESCRIPTION	MATERIAL
1	12-01-00	Protection Cap	Nylon S-PA0401 - according to ASTM D5989
2	12-01-01	Protection Cap Bolts	Stainless Steel GR316L - according to ASTM F593
3	12-01-02	Protection Cap O-Ring	NBR - according to FDoT Tab.2.2.1.7-1 Sec.960
4	00-01-03	NPT Pipe Nipple 1/2"	SCH80 PVC or SCH40 steel
5	00-01-04	NPT Ball Valve 1/2"	PVC 150 psi rated

21	00-07-05	Adaptor 21mm-3/4"	Polypropylene - according to ASTM D4101
22	00-07-08	21mm Plug	High Density Polyethylene - according to ASTM D3350
23	12-07-06	Heat Shrink Sleeve	Coated Polyolefin Backing - according to FDoT Tab.2.2.1.8-1 Sec.960
24	00-08-00	Strand 0.6"	Steel GR270 - according to ASTM A416
25	12-07-07	Duct Coupler 3.00" stepless	Polypropylene - according to ASTM D4101
26	00-09-00	Heat Shrink Wrap	Coated Polyolefin Backing - according to FDoT Tab.2.2.1.8-1 Sec.960

NOTE:

- Components marked with "T" on the drawing are temporary;
- Port and hose assembly may be oriented in any required direction to create a vent or a drain.
- Epoxy grout shall be used to fill recesses: make reference to FDoT standard plans index 462-003 for post-tensioning anchorage and tendon filling details
- Concrete cover must meet FDoT Structures Design Guidelines Section 1.4.2

STANDARD SPIRAL
FOR CONCRETE CLASS $f'_{ci} = 4000\text{psi}$ [27.5MPa] *

STANDARD SPIRAL
FOR CONCRETE CLASS $f'_{ci} = 6500\text{psi}$ [45MPa] *

Tie the first 1-1/2 turns at the bearing plate side of the spiral to achieve full development

NO. OF TURNS:
7.5

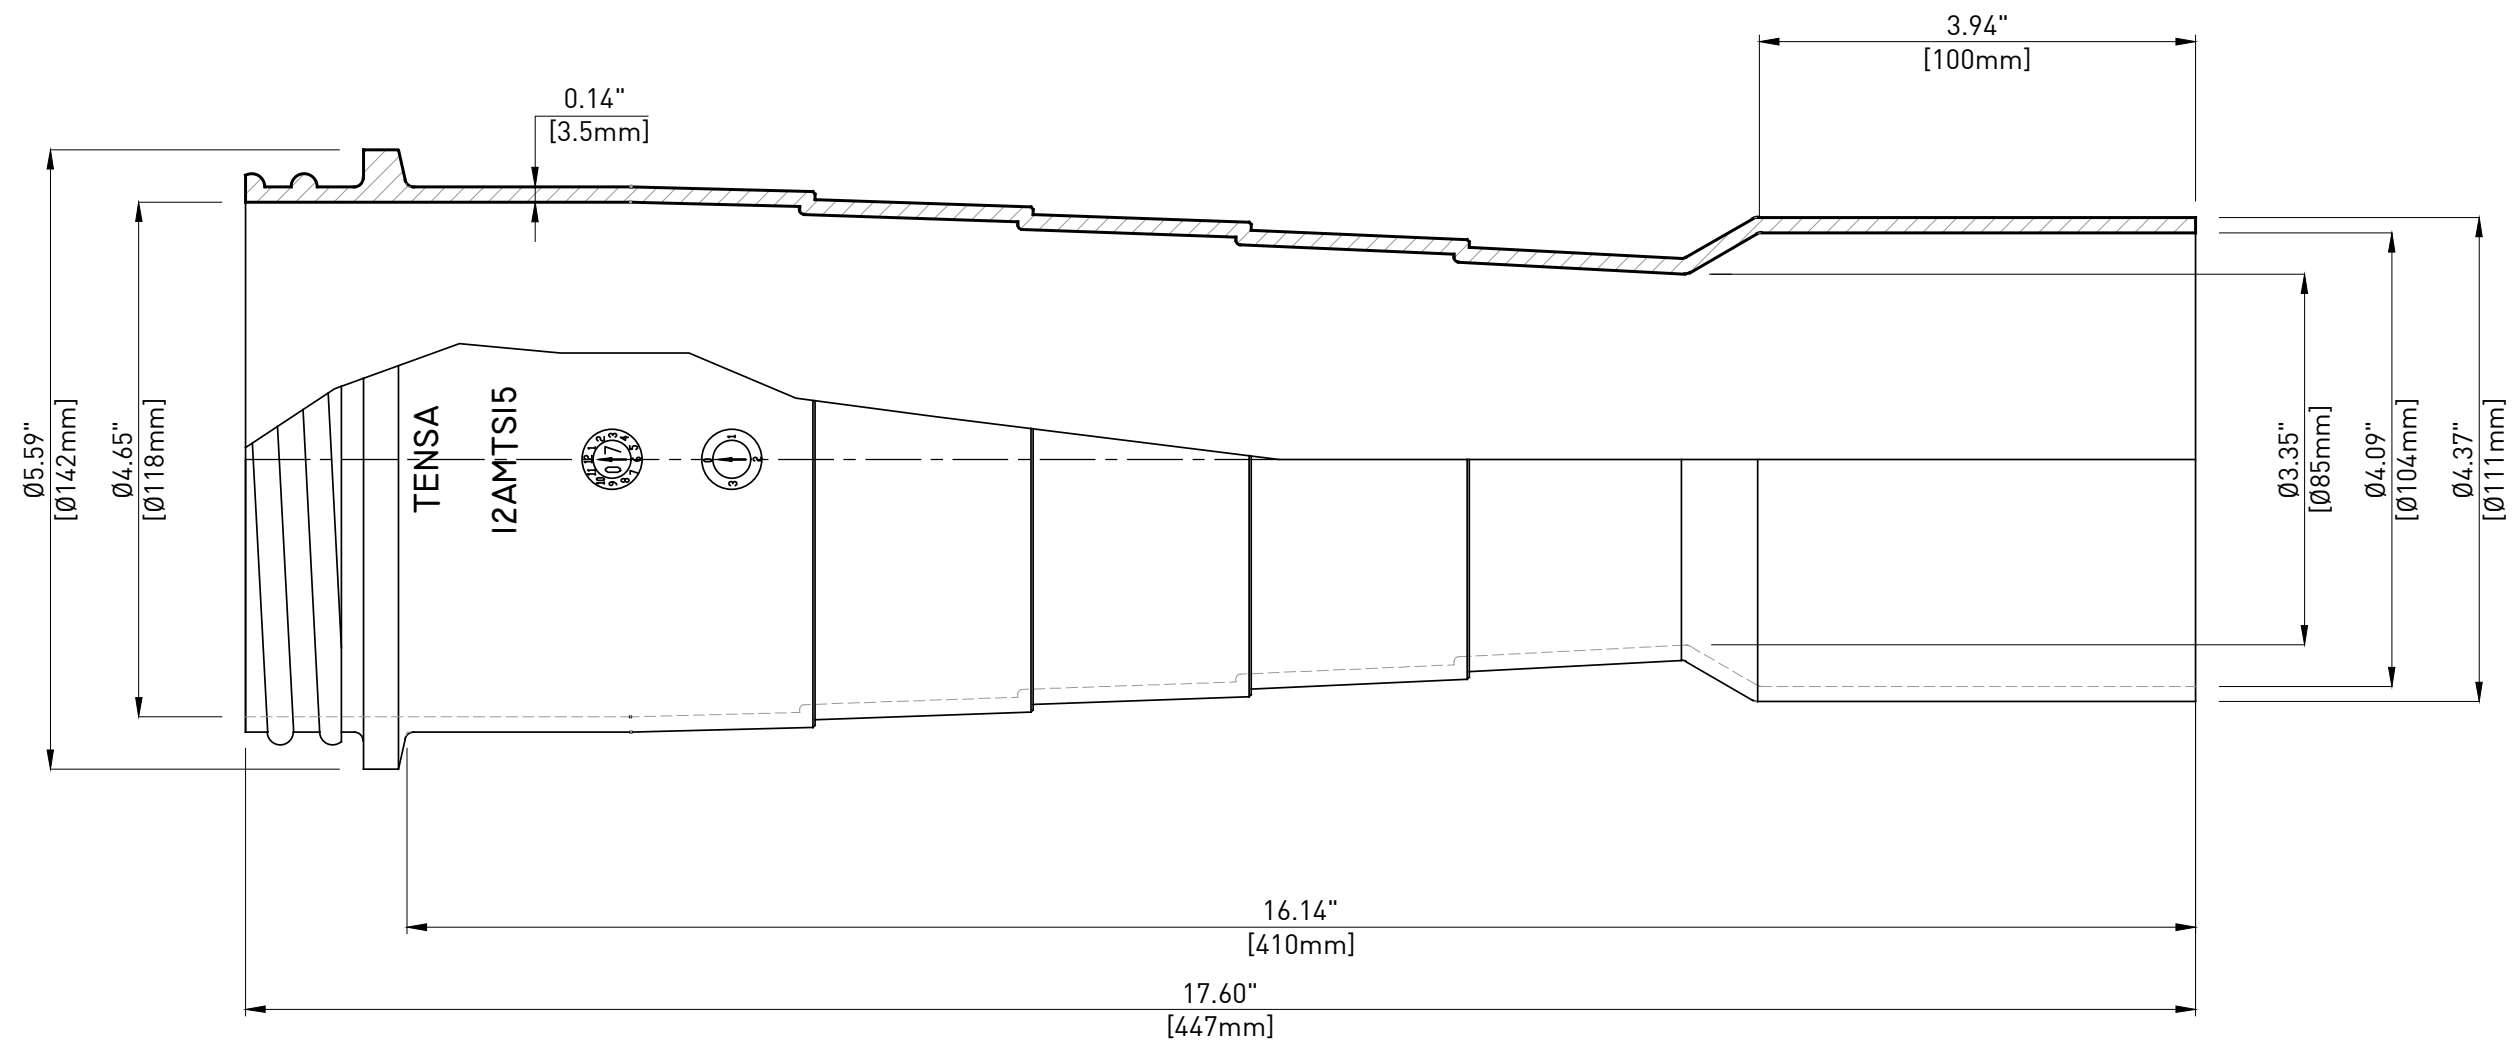

I have independently reviewed the calculations and testing reports, along with the documentation and certified that TENSA system spiral rebar detail meets the requirements as outlined in paragraph 3.3 PTI Anchorage Zone Design.

(*) Do not apply post-tensioning forces until the concrete mean compressive strength f'_{ci} is not less than the values shown in the present drawing.

NOTE: The local zone reinforcement is to be shown on the shop drawings.

ELEVATION

SECTION A-A

INSTALLATION

Surface Preparation

1. Lightly abrade the coupler (or trumpet) and duct to a distance of 2 inches (50mm) beyond each end of the shrinksleeve.
2. Wipe clean the coupler (or trumpet) and duct to remove foreign contaminants. Ensure that the components are dry before cleaning.

Installation

3. Completely remove the inner release liner from the sleeve and center the shrinksleeve over the joint to be sealed.
4. Using the appropriate sized heat gun or torch, begin at the center of the shrinksleeve and heat circumferentially around the duct and coupler. Use broad strokes.
5. Continue heating from the center toward one end of the shrinksleeve until recovery is complete (sleeve has shrunk). In a similar manner heat and shrink the remaining side. Shrinking has been completed when the adhesive begins to ooze at the shrinksleeve edges all around the circumference.
6. Finish shrinking the sleeve with long horizontal strokes over the entire surface to ensure a uniform bond.
7. Allow the shrinksleeve to cool for two hours prior to usage.

Inspection

8. Check the full contact of sleeve with the coupler (or trumpet) and duct.
9. Check that adhesive flows beyond both sleeve edges.
10. Check that no cracks or holes are present in shrinksleeve backing.

NOTE:

- The installation procedure is general; reference to manufacturer's instruction manual for the detailed installation instructions;
- This drawing is not intended for manufacturing purposes;
- Heat shrink sleeve meets or exceeds FDoT requirements (Table 2.2.1.8-1 Section 960);
- Tabular sleeve diameter:
 - 4.7" [120mm] as supplied
 - 3.3" [81mm] fully recovered
