**Tubular sleeve for pipeline corrosion protection**

**Product Description**
- CanusaTubes™ are shipped with an inner release liner for protection from contamination.

**Equipment List**
- Propane tank, hose, torch & regulator;
- Appropriate tools for surface abrasion;
- Knife, roller, rags & approved solvent cleanser;
- Digital thermometer with suitable probe;
- Standard safety equipment; gloves, goggles, hard hat, etc.

**Surface Preparation**
- Ensure that the PE coating edges are beveled to 30°. Clean exposed steel and adjacent pipe coating with a solvent cleanser to remove the presence of oil, grease, and other contaminants.

**Sleeve Installation**
- Before welding together the carrier pipe, slide the CanusaTube sleeve at least 1 m away from the cutback area of the joint.

**Flame Intensity & Torch Size**
- Use moderate flame intensity for pre-heating and shrinking.
- **Minimum Torch Size:** 150,000 BTU/hr.

**Pre-Heat**
- Pre-heat the joint area to a minimum of 60°C (140°F). Using a temperature measuring device, ensure the correct temperature is reached on the steel and at least 50mm (2") on each side of the sleeve.

**Surface Preparation**
- Ensure that there is no dirt or moisture inside the tube and that the tube is not cut. If the sleeve is not useable, a one-piece Wrapid Sleeve or Canusa Wrap sleeve should be used.

**Sleeve Installation**
- Wipe clean or air blast the steel and pipe coating to remove foreign contaminants.

**Pre-Heat**
- Ensure that the pipe dry before cleaning. Prepare the steel joint area to a minimum of St3 /SP3. Lightly abrade the pipe coating adjacent to the weld area to a distance of 50mm (2") beyond each end of the sleeve width.

**Sleeve Installation**
- Completely remove the inner release liner from the sleeve and centre the sleeve over the area to be sealed.

**Sleeve Installation**
- Using the appropriate sized torch, begin at the centre of the sleeve and heat circumferentially around the pipe. Use broad strokes.

**Pre-Heat**
- Continue heating from the centre toward one end of the sleeve until recovery is complete. In a similar manner, heat and shrink the remaining side. With a yellow backing, a pink-orange shade will appear when the proper temperature has been reached.
Shrinking has been completed when the adhesive begins to ooze at the sleeve edges all around the circumference. Finish shrinking the sleeve with long horizontal strokes over the entire surface to ensure a uniform bond.

While the sleeve is still hot and soft, use a hand roller to firmly roll the sleeve surface and push any trapped air up and out of the sleeve, as shown above. If necessary, reheat to roll out any remaining air.

Visually inspect the installed sleeve for the following:
- Sleeve is in full contact with the steel joint.
- Adhesive flows beyond both sleeve edges.
- No cracks or holes in sleeve backing.

After shrinking is complete, allow the sleeve to cool for 2 hours prior to lowering and backfilling. To prevent damage to the sleeve, use selected backfill material, (no sharp stones or large particles) otherwise an extruded polyethylene mesh or other suitable shield should be used.

**Backfilling Guidelines**

**Storage & Safety Guidelines**

To ensure maximum performance, store Canusa products in a dry, ventilated area. Keep products sealed in original cartons and avoid exposure to direct sunlight, rain, snow, dust or other adverse environmental elements. Avoid prolonged storage at temperatures above 35°C (95°F) or below -20°C (-4°F). Product installation should be done in accordance with local health and safety regulations.

These installation instructions are intended as a guide for standard products. Consult your Canusa representative for specific projects or unique applications.
