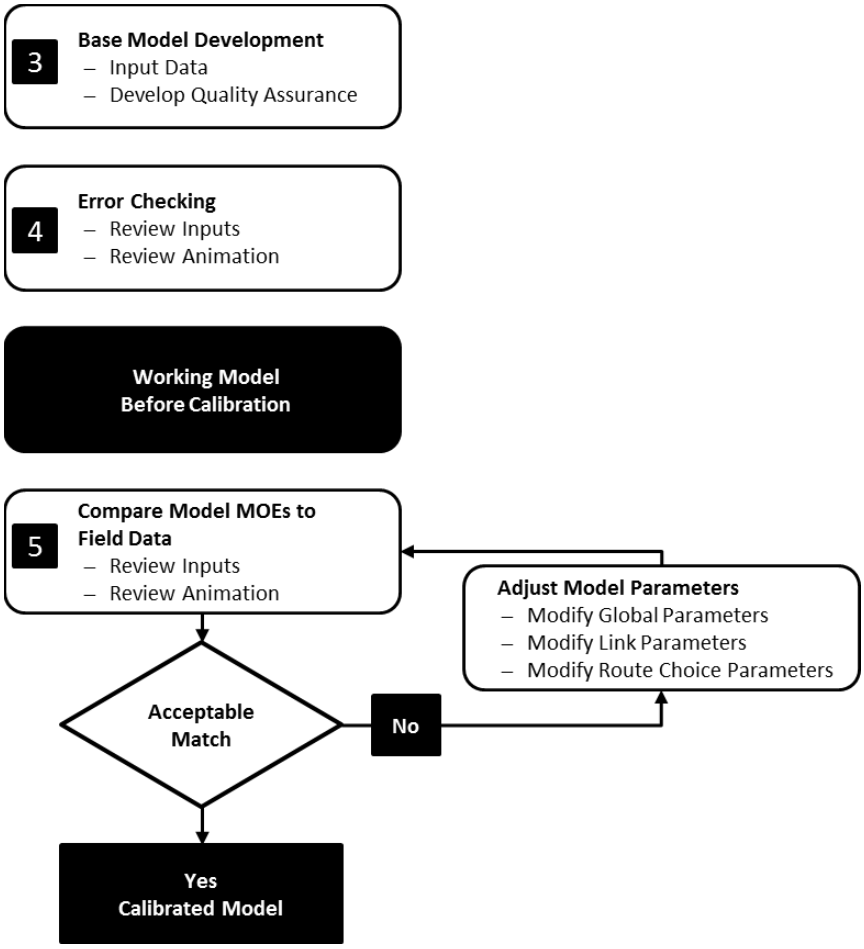
Appendices

Appendix A Demand Matrix
Appendix B Existing AM and PM VISSIM Models

The purpose of this report is to document the VISSIM (Version 8, Service Pack 09) microsimulation model development and calibration effort for the existing 2016 AM and PM peak period conditions for the SW 10th Street project.

The VISSIM model was developed and calibrated following guidelines in the Florida Department of Transportation (FDOT) *Traffic Analysis Handbook: A Reference for Planning and Operations*. **Figure 1** shows the model calibration process. Model calibration is achieved by iteratively changing model parameters to replicate the traffic patterns, congestion, bottlenecks, and driver behavior observed within the study area.

Figure 1
VISSIM Microsimulation Calibration Process

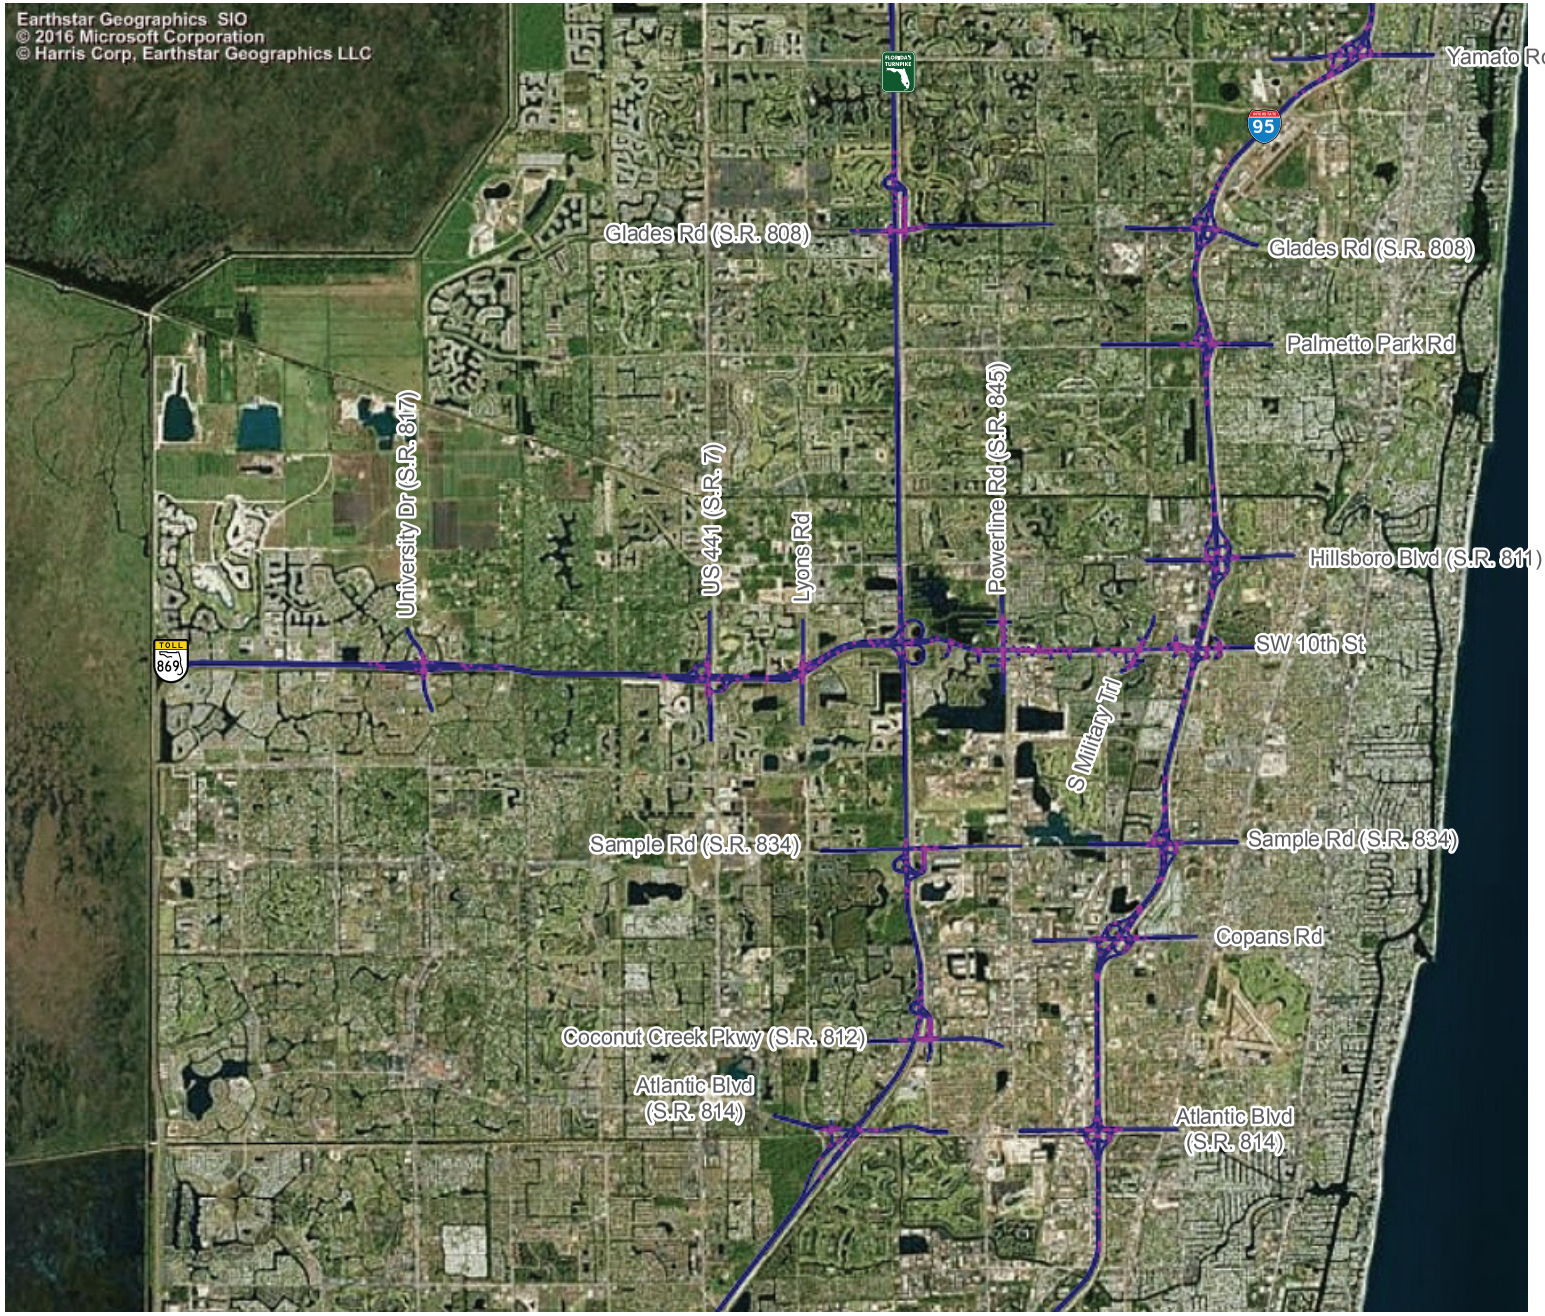


Once the model was calibrated, the measures of effectiveness (MOEs) were produced and compared with the field-collected data to validate the calibration effort. When validation is performed and the model produces operations that reasonably represent the existing conditions, the future build alternatives model will be created to assess the effects of extending the Sawgrass Expressway east to I-95 and adding express lanes and corresponding connections, and to provide speed comparisons between the general-use and tolled express lanes using future traffic forecasts.

The Existing VISSIM network was developed by merging together previously developed VISSIM models for the Sawgrass Expressway and Interstate 95 (I-95). The SW 10th Street portion of the study area was then developed and added to the model using 2016 aerial photography. Roadway dimensions and features were extracted from the aerial photographs and verified by field review. It was an objective of the project team to include the extent of the real-world queues within the modeled network. Therefore, the modeled limits of the arterials extended a minimum of 0.5 mile outside of the capital construction project limits.

VISUM (version 14), a travel demand modeling software compatible with VISSIM, was used to transfer and refine Origin-Destination (O-D) information from the Cube model into the VISSIM model. Bluetooth data was used as a check to validate the AM and PM Peak O-D matrices estimated by the Cube model for the existing conditions. The resulting CUBE O-D Matrices were then exported into VISUM and served as seed matrices for the Origin-Destination Matrix Estimation (ODME) process that merges control count data with the O-D trip pattern data. The ODME was performed using VISUM's T-Flow Fuzzy function to modify the 3-Hour peak period O-Ds to single peak hour O-D matrices that correspond to the previously developed balanced flow volume diagrams for the ramp to ramp freeway matrices. Following the T-Flow Fuzzy O-D matrix estimation process, the static routes were imported into the VISSIM model from VISUM. The final demand matrix produced by VISUM is provided in **Appendix A**. The modeled network limits are in accordance with the FDOT's *Traffic Analysis Handbook*. The entire VISSIM study network is shown on **Figure 2**.

Not to Scale



FLORIDA'S TURNPIKE	SW 10th Street PD&E Study VISSIM Calibration Report	VISSIM Model Study Area	**Figure 2**

The morning and evening peak periods in the study area are from 6:30 AM to 9:30 AM and 4:00 PM to 7:00 PM, and the AM and PM peak hours are from 7:30 AM to 8:30 AM and from 5:00 PM to 6:00 PM, respectively. For this project, it was identified that a peak period VISSIM model that depicted buildup and dissipation of congestion in the study area corridor should be developed. Therefore, one hour prior to the peak hour and one hour after the peak hour were included in the VISSIM models. In addition to the peak hour and two shoulder hours, a 30-minute seeding time was included to load the network with traffic to reach equilibrium between the number of vehicles entering and exiting the network. Therefore, the entire simulation periods were defined as 6:00 AM to 9:30 AM and 3:30 PM to 7:00 PM.

The input volumes in the VISSIM model were entered in 15-minute intervals during the entire simulation. **Table 1** summarizes the loading factors used to convert the balanced 2016 peak hour volumes into pre-peak hour and post-peak hour volumes. These factors were developed based on time-slicing factors derived from the hourly traffic volume distribution recorded in the field.

Table 1
Hourly Volume Conversion Factor

	Simulation Time (Seconds)	AM Condition		PM Condition	
		15 minutes	Hourly	15 minutes	Hourly
Seed Time	0 - 900	9.38%	22.07%	22.08%	45.34%
	900 - 1800	12.69%		23.26%	
Pre Peak Hour	1800 - 2700	16.57%	81.55%	22.37%	92.31%
	2700 - 3600	19.38%		22.92%	
	3600 - 4500	21.29%		23.20%	
	4500 - 5400	24.31%		23.82%	
Peak Hour	5400 - 6300	25.50%	100.00%	24.25%	100.00%
	6300 - 7200	25.32%		25.20%	
	7200 - 8100	24.74%		25.39%	
	8100 - 9000	24.44%		25.17%	
Post Peak Hour	9000 - 9900	23.60%	87.19%	24.44%	92.82%
	9900 - 10800	22.38%		24.07%	
	10800 - 11700	20.74%		22.83%	
	11700 - 12600	20.47%		21.48%	

Existing traffic operations, including volumes, speeds, queues, bottlenecks, and driver behavior are needed to calibrate a microsimulation model. Field observations were made on October 18 through October 20, 2016, to document traffic bottlenecks and congested areas on the mainline, and queuing on the arterials. The field observations and queues are documented in the report titled *SW 10th Street PD&E Project Traffic Forecast Memorandum*. The following is a summary of observations:

- On a day-to-day basis, the beginning and ending times of the worst congestion and queuing vary.
- During the AM peak period, the heaviest congestion, with frequent stop-and-go conditions, was observed in both the northbound and the southbound directions on I-95.
- During the PM peak period, significant congestion, with frequent stop-and-go conditions, was observed in both the northbound and the southbound directions on I-95.
- The traffic operations on Florida's Turnpike were significantly better than I-95 at the same cross streets. Crashes and incidents during peak periods compounded congestion severity and increased the extent and duration of traffic queues.
- For the most part, Sawgrass Expressway traffic operations were stable, with the majority of vehicles traveling faster than the posted speed limit and no significant queueing observed.
- Crashes during peak periods compounded congestion severity and increased the extent and duration of traffic queues.

Two sets of data were used to document field speeds:

- HERE data
- Field-collected GPS data

Morning and evening peak period speed data provided by HERE, Inc. were obtained along the study area roadways. The GPS data were collected by project staff between October 18 and October 20, 2016. The speeds are documented in the report titled *SW 10th Street PD&E Project Traffic Forecast Memorandum*.

Calibration criteria were defined to make sure that the model accurately reflects existing traffic conditions. Calibration targets were established based on vehicle flow, average speeds, and queues. The calibration targets adopted for this project are shown in **Table 2** per the FDOT *Traffic Analysis Handbook*.

Table 2
Model Calibration Targets

Calibration item	Calibration Target/Goal
Capacity	Simulated capacity to be within 10% of the field measurements.
Traffic Volume	Simulated and measured link volumes for more than 85% of links to be: ▪ Within 100 vph for volumes less than 700 vph ▪ Within 15% for volumes between 700 vph and 2700 vph ▪ Within 400 vph for volumes greater than 2700 vph.
	Simulated and measured link volumes for more than 85% of links to have a GEH* statistic value of five (5) or lower.
	Sum of link volumes within calibration area to be within 5%.
	Sum of link volumes to have a GEH* statistic value of 5 or lower.
Travel Time (includes Transit)	Simulated travel time within ±1 minute for routes with observed travel times less than seven (7) minutes for the routes identified in the data collection plan.
	Simulated travel time within ±15% for routes with observed travel times greater than seven (7) minutes for the routes identified in the data collection plan.
Speed	Modeled average link speeds to be within the ±10 mph of field-measured speeds on at least 85% of the network links.
Intersection Delay	Simulated and field-measured link delay times to be within 15% for more than 85% of cases.
Queue Length	Difference between simulated and observed queue lengths to be within 20%.
Visualization	Check consistency with field conditions of the following: on-ramp and off-ramp queuing; weaving maneuvers; patterns and extent of queue at intersection and congested links; lane utilization/choice; locations of bottlenecks; etc.
	Verify there are no unrealistic U-turns or vehicles exiting and reentering the network.

*The GEH is computed as follows: $GEH = \sqrt{\frac{(Model\ Volume - Field\ Count)^2}{(Model\ Volume + Field\ Count)/2}}$

Due to the stochastic nature of microsimulation models, it is necessary to take an average of multiple runs with different random seed numbers to provide statistically meaningful results. The computation of the minimum number of runs needed is based on the guidelines provided in the Federal Highway Administration's (FHWA's) *Traffic Analysis Toolbox Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software*. The number of repetitions needed is estimated in an iterative process. A preliminary set of repetitions is usually needed to make the first estimate of the average and standard deviation for the results. The first estimate of the average and standard deviation are then used to estimate the number of repetitions needed to make statistical conclusions.

To identify the minimum number of runs needed, the VISSIM network-wide average speed was used for variation comparison. Initially, three VISSIM model runs were performed using seed numbers 10, 30, and 45. Based on the network-wide average speed produced, a standard deviation was calculated, and a desired confidence interval of +/- 0.6 mph was assumed for both the AM model and the PM model. Then, iterations were performed using the Student t-statistic for a 95 percent confidence level until convergence for the number of runs needed was achieved.

Tables 3 and **4** show the iteration results for Existing 2016 AM and PM VISSIM models, respectively. The iteration process indicates that the AM and PM VISSIM models needed a minimum of nine model runs. To be conservative, 10 VISSIM model runs were performed for each peak period model using random seeds starting from 10, with increments of 5 (i.e., seed numbers 10, 15, 20, 25, 30, 35, 40, 45, 50, and 55).

Table 3
Number of Runs Needed – Existing 2016 AM VISSIM Model

Model calibration is achieved by iteratively changing model parameters to replicate the traffic patterns, congestion, bottlenecks, and driver behavior observed within the study area. As this VISSIM network was developed by merging together previously developed and calibrated VISSIM models for the Sawgrass Expressway and Interstate 95 (I-95), the driver behaviors were retained as a starting point in the calibration process rather than using the default values. The initial model MOEs were then compared to collected data and field observations. Then iteratively, the calibration parameters were adjusted to make sure that the model reasonably reflected existing conditions. The model outputs were compared to the vehicle volumes that were processed through the system, vehicle speeds, bottlenecks, and observed queues.

The model was calibrated by adjusting vehicle following and lane changing driver behavior parameters. Driving behaviors at merge, diverge, and weaving areas were replicated by first adjusting lane change distances based on field observations. It is common practice to modify the lane change distances according to observed behavior and if congested, to match the queuing behavior.

If lane change distances did not produce the desired behavior, then vehicle following behavior parameters were adjusted. The driving behavior parameters were iteratively adjusted until the desired traffic conditions were achieved.

The VISSIM microsimulation model was calibrated using a simulation resolution of five time steps per simulation second.

7.1 DRIVER BEHAVIOR PARAMETERS

The VISSIM model parameters used for calibration are categorized as vehicle following (longitudinal vehicle movement) and lane change (lateral vehicle movements). Driving parameters for freeways and arterials are defined differently in VISSIM. Freeway driving is generally better modeled using the Wiedemann 99 driving behavior parameter set, while arterials are generally assigned the Wiedemann 74 driving behavior.

7.2 VEHICLE FOLLOWING PARAMETERS

The main vehicle following behavior parameters for both freeways and arterials are look ahead distance, look back distance, number of observed vehicles, and temporary lack of attention.

Table 5 shows the ranges of the freeway/Wiedemann 99 vehicle following driving behavior parameters and the values resulting from the calibration effort. The justifications for adjusting some of the vehicle following parameters are as follows:

- *CC0 (Standstill distance):* The default value is 4.92 feet. For mainline segments and merge/diverge areas, the minimum distances defined are 4 and 4.92 feet, respectively. This parameter is the minimum distance a vehicle will maintain when the traffic is not moving (i.e., standstill).

- *CC1 (Headway time):* The CC0 and CC1 values define a minimum following distance that the most aggressive driver will maintain on the defined segment in the model.

  For Florida's Turnpike, the CC1 values are as follows:

  - Mainline segments – 1.18
  - Merge/diverge and weave areas – 1.09
  - Weave areas – 1.08
  - High volume segments areas – 1.02
  - Mainline Toll area – 1.58

  For Sawgrass Expressway, the CC1 values are as follows:

  - Mainline segments – 1.18
  - Merge areas – 1.13
  - Diverge areas – 1.15
  - Weave areas – 1.08
  - High volume segments – 1.00

  For I-95, the CC1 values are as follows:

  - Mainline segments– 1.25
  - Merge/diverge and weave areas – 1.09
  - High volume merge/diverge areas – 1.19
  - Over-saturated segments – 0.98
  - Mainline curved segments – 1.35
  - Reduced speed segments – 1.7

- *CC2 (Following variation):* For the mainline, the values range between 13.12 feet (i.e., default) and 25.00 feet. *CC2* defines a range of additional distances a driver will maintain while following a vehicle. The least aggressive driver in the model will use the maximum value defined for this parameter.

Table 5
Freeway Vehicle Following Calibration Parameter Ranges

Wiedemann 99 Parameters		Defaults	Freeway Calibration Range
CC0 (Standstill Distance) (feet)		4.92	4.00 and 6.00
CC1 (Headway Time) (seconds)		0.90	0.85-1.50
CC2 (Following Variation) (feet)		13.12	13.12, 14.99, and 25.00
CC3 (Threshold for Entering Following)		-8.00	-8.00
CC4 (Negative Following Threshold)		-0.35	-0.35
CC5 (Positive Following Threshold)		0.35	0.35
CC6 (Speed Dependency of Oscillation)		11.44	11.44
CC7 (Oscillation Acceleration)		0.82	0.82
CC8 (Standstill Acceleration)		11.48	11.48
CC9 (Acceleration at 50 mph) (feet/seconds^2)		4.92	4.92
Look Ahead Distance	Minimum (feet)	0.00	0.00
	Maximum (feet)	820.21	820.21
	Observed Vehicles	2	2-4
Look Back Distance	Minimum (feet)	0.00	0.00
	Maximum (feet)	492.13	492.13
Temporary Lack of Attention	Duration (seconds)	0.00	0.00
	Probability (%)	0.00	0.00
Smooth Close-up Behavior (Uncheck Check)		Uncheck	Check
Standstill Distance for Static Obstacles (feet)		Uncheck	Check

Tables 6 and **7** detail the freeway vehicle following parameters for vehicle types and freeway segment types used in the VISSIM model for the AM and PM, respectively. The color highlighting in **Tables 6** and **7** matches the VISSIM link colors to indicate where the respective driver behavior parameters have been applied in the model.

In the arterial/Wiedemann 74 model, there are three main parameters that can be adjusted to match the traffic conditions observed in the field. These parameters are standstill distance, additive part of safety distance, and multiplicative part of safety distance. The additive and multiplicative parts of safety distance parameters affect the ideal saturation flow rate of the arterials. **Table 8** shows the ranges of Wiedemann 74 model vehicle following parameters and the values resulting from the calibration effort.

Table 8
Arterial Vehicle Following Parameters

Wiedemann 74 Parameters		Defaults	Arterial Calibration Range
Average Standstill Distance (feet)		6.56	4.00 and 6.56
Additive Part of Safety Distance (feet)		2.00	1.50-3.45
Multiplicative Part of Safety Distance (feet)		3.00	2.50-4.45
Look Ahead Distance	Minimum (feet)	0.00	0.00
	Maximum (feet)	820.21	820.21
	Observed Vehicles	4	4
Look Back Distance	Minimum (feet)	0.00	0.00
	Maximum (feet)	492.13	492.13

7.3 LANE CHANGING PARAMETERS

The VISSIM model has two main categories of lane change parameters:

- *Necessary lane change:* These parameters are used by a vehicle to make lane changes to maintain/reach its defined route.
- *Free lane change:* These parameters are used by a vehicle to make lane changes to shift to a lane with more room or higher speed.

During field observation, it was observed that drivers were making aggressive lane changes. To replicate this behavior, the following adjustments were made to the freeway and some of the arterial lane changing parameters:

- *Minimum Headway:* This value was reduced to enable lane changes when smaller gaps were available.
- *Safety Distance Reduction Factor:* This value was reduced so that while changing lanes, a vehicle can move closer to the preceding vehicle than the following distance defined by the vehicle following parameters. After the lane change is performed, a vehicle maintains the safety distance as defined by the vehicle following parameters.
- *Maximum Deceleration for Cooperative Braking:* This value was increased to 29.99 feet/second^2 and 31.99 feet/second^2 at different locations. These values represent maximum allowable braking for cars and trucks.
- *Overtake Reduce Speed Areas:* This was enabled so that faster vehicles can pass slower vehicles on dual lane ramps and roadway segments where the speeds are reduced due to curvature.
- *Cooperative Lane Change:* This parameter was enabled in merge/diverge influence areas so the mainline vehicle moves safely to allow the merging of vehicles from a ramp.
- *Lane Change Distance:* This parameter defines the distance at which vehicles begin to attempt to change lanes. Changes to this parameter were applied to most of the connectors at locations where the number of lanes decreased on the mainline, at merge and diverge areas, and at intersections. Changes may vary based on the location, and range from the default value of 656.2 feet to 5,000 feet.

Table 11 shows the vehicle lane change parameters for freeways from the calibration effort. **Table 12** shows similar information for the arterials.

Table 11
Freeway Lane Change Parameters

Lane Change Parameters		Default	Freeway Calibration Parameters
Necessary Lane Change (Route)			
Maximum Deceleration (feet/second^2)	Own	-13.12	-13.12
	Trailing Vehicle	-9.84	-9.84
- 1 foot/second^2 per Distance	Own	200.00	200.00
	Trailing Vehicle	200.00	200.00
Accepted Deceleration (feet/second^2)	Own	-3.28	-3.28
	Trailing Vehicle	-1.64	-1.64
Waiting Time Before Diffusion (seconds)		60.00	180.00
Minimum Headway (front/rear) (feet)		1.64	0.98 and 1.51
To Slower Lane if Collision Time Above (seconds)		0.00	0.00
Safety Distance Reduction Factor		0.60	0.25 and 0.40
Maximum Deceleration for Cooperative Braking (feet/second^2)		-9.84	-29.99 and -31.99
Overtake Reduced Speed Area		Uncheck	Check
Advanced Merging		Check	Check
Cooperative Lane Change		Uncheck	Check
If Checked	Maximum Speed Difference (mph)	6.71	6.71
	Maximum Collision Time (seconds)	10.00	10.00

Table 12
Arterial Lane Change Parameters

Lane Change Parameters		Default	Arterial Calibration Parameters
Necessary Lane Change (Route)			
Maximum Deceleration (feet/second^2)	Own	-13.12	-13.12
	Trailing Vehicle	-9.84	-9.84
- 1 foot/second^2 per Distance	Own	100.00	100.00
	Trailing Vehicle	100.00	100.00
Accepted Deceleration (feet/second^2)	Own	-3.28	-3.28
	Trailing Vehicle	-3.28	-3.28
Waiting Time Before Diffusion (seconds)		60.00	180.00
Minimum Headway (front/rear) (feet)		1.64	1.51
To Slower Lane if Collision Time Above (seconds)		0.00	0.00
Safety Distance Reduction Factor		0.60	0.25, 0.40 and 0.50
Maximum Deceleration for Cooperative Braking (feet/second^2)		-9.84	-29.99 and -31.99
Overtake Reduced Speed Area		Uncheck	Check
Advanced Merging		Check	Check
Cooperative Lane Change		Uncheck	Check
If Checked	Maximum Speed Difference (mph)	6.71	6.71
	Maximum Collision Time (seconds)	10.00	10.00

A comparison of existing volumes to modeled volumes was performed for the freeway, ramps, and intersections.

8.1 UNMET DEMAND AT ENTRY LINKS

An important assessment is to identify whether the expected vehicular demand can be processed at the network entry links. If the model outputs indicated that substantial demand was not able to enter the network, the lengths of the entry links with unmet demand were extended to store more vehicles. If unmet demand was still reported, the driver behavior was adjusted for the link(s) that reported issues.

Simulation results performed after calibration indicated there was unmet demand of only one or two vehicles for both periods.

8.2 MAINLINE AND RAMP VEHICLES PROCESSED

Tables 13 and **14** show calibration results for the AM peak period for the mainline and ramps, respectively. **Tables 15** and **16** show calibration results for the PM peak period for the mainline and ramps, respectively.

The existing conditions volume calibration results are summarized for the AM and PM peak period models as follows:

- ***Calibrated Existing 2016 AM Model*** – calibration target for the sum of the mainline and ramp link flows is achieved for 99.2 percent of cases.
- ***Calibrated Existing 2016 AM Model*** – GEH targets for individual mainline and ramp link flows are achieved for 100.0 percent of cases.
- ***Calibrated Existing 2016 PM Model*** – calibration target for the sum of the mainline and ramp link flows is achieved for 99.2 percent of cases.
- ***Calibrated Existing 2016 PM Model*** – GEH targets for individual mainline and ramp link flows is achieved for 99.2 percent of cases.

These results indicate the existing VISSIM models satisfy the volume calibration criteria.

8.3 INTERSECTION VEHICLES PROCESSED

Tables 17 and **18** show calibration results for the AM and PM peak periods, respectively, at the intersections.

The existing conditions intersection movement volume calibration results are summarized for the AM and PM peak period models as follows:

- ***Calibrated Existing 2016 AM Model*** – calibration targets for individual turning movements are satisfied for 100.0 percent of cases.
- ***Calibrated Existing 2016 AM Model*** – GEH targets for individual turning movements are achieved for 100.0 percent of cases.
- ***Calibrated Existing 2016 PM Model*** – GEH targets for individual turning movements are achieved for 99.2 percent of cases.
- ***Calibrated Existing 2016 PM Model*** – calibration targets for individual turning movements are satisfied for 100.0 percent of cases.

These results indicate the existing VISSIM models satisfy the volume calibration targets.

The VISSIM model parameters for the existing 2016 AM and PM peak period conditions were adjusted to depict buildup and dissipation of the congested locations. Visual audits of the simulation models indicated that field-observed congestion was replicated, as shown on **Figures 3** and **4**. The calibration for the visual audit of the models was satisfied.

FLORIDA'S TURNPIKE	SW 10th Street PD&E Study VISSIM Calibration Report	PM Peak Period VISSIM Queues	Figure 4

Field-collected GPS travel time and speed data from 100 travel time runs collected over three days in October 2016 showed that, for the most part, Sawgrass Expressway traffic was traveling faster than the posted speed limit. The traffic operations on Florida's Turnpike were significantly better than I-95 at the same cross streets. The data also showed that along I-95, heavy congestion occurred during both the AM and PM peak periods.

The field-collected GPS data were used to calibrate the existing conditions VISSIM models. The field and model speeds were compared at basic freeway segments within the interchanges to capture the majority of vehicles that are through traffic. These segments were selected, as all of the vehicles have the same origin and destination and can therefore be directly compared to the field data that was collected along travel time routes that started and ended at the study limits of the three freeways. The existing conditions speed calibration results are shown in **Tables 19** and **20** for the AM and PM peak period models, respectively, and are summarized below. The calibrated VISSIM models are provided in **Appendix B** and detailed speed calibration results are provided in **Appendix C**.

10.1 CALIBRATED EXISTING 2016 AM MODEL

Florida's Turnpike

- The northbound calibration target was achieved for 100 percent, 60 percent, and 100 percent of the speed segments during the pre-peak, peak, and post-peak hours, respectively. Even though some of the modeled hourly speeds did not match the observed speeds, the trend of the average speeds was similar.
- The southbound calibration target was met for 100 percent, 80 percent, and 100 percent of the speed segments during the pre-peak, peak, and post-peak hours, respectively. Even though some of the modeled hourly speeds did not match the observed speeds, the trend of the average speeds was similar.

Sawgrass Expressway

- The eastbound calibration target was achieved for 100 percent, 100 percent, and 50 percent of the speed segments during the pre-peak, peak, and post-peak hours, respectively. Even though some of the modeled hourly speeds did not match the observed speeds, the trend of the average speeds was similar.
- The westbound calibration target was achieved for 100 percent of the speed segments during the pre-peak, peak, and post-peak hours.

SW 10th Street

- The eastbound and westbound calibration target was achieved for 100 percent of the speed segments during the pre-peak, peak, and post-peak hours.

I-95

- The northbound and southbound calibration target was achieved for 100 percent of the speed segments during the pre-peak, peak, and post-peak hours.

10.2 CALIBRATED EXISTING 2016 PM MODEL

Florida's Turnpike

- The northbound and southbound calibration target was achieved for 100 percent of the speed segments during the pre-peak, peak, and post-peak hours.

Sawgrass Expressway

- The eastbound and westbound calibration target was achieved for 100 percent of the speed segments during the pre-peak, peak, and post-peak hours.

SW 10th Street

- The eastbound and westbound calibration target was achieved for 100 percent of the speed segments during the pre-peak, peak, and post-peak hours.

I-95

- The northbound calibration target was achieved for 100 percent, 100 percent, and 67 percent of the speed segments during the pre-peak, peak, and post-peak hours, respectively.
- The southbound calibration target was met for 67 percent, 100 percent, and 67 percent of the speed segments during the pre-peak, peak, and post-peak hours, respectively.

The overall combined model calibration target was achieved for 94 and 97 percent of the speed segments for the three-hour AM and PM peak periods, respectively.

Charts 1 through **32** show GPS and HERE field speeds compared to the AM and PM three-hour peak period models for the Florida's Turnpike, Sawgrass Expressway/SW 10th Street, and I-95.

The goal of the calibration effort was to have the model produce speed trends and speed values similar to the field GPS data during the peak periods. In **Charts 1** through **32**, variance between model and field GPS speeds can be observed on the heavily congested mainline segments due to daily randomness in the start and end time of congestion; however, speed variance on uncongested mainline segments was less and values closely matched the field GPS data.

The VISSIM average network performance statistics for the modeled peak hours, 7:30 AM to 8:30 AM and 5:00 PM to 6:00 PM, are shown in **Table 21**.

Table 21 indicates that during the AM peak hour, 117,413 vehicles were processed, with an average speed of 49 mph and an average delay time per vehicle of 1.53 minutes; and there was an unmet demand (i.e., unprocessed vehicles) of six in the network. Similarly during the PM peak hour, 124,969 vehicles were processed, with an average speed of 48 mph and an average delay time per vehicle of 1.67 minutes; and there was unmet demand (i.e., unprocessed vehicles) of two in the network.

Table 21
Existing 2016 Average VISSIM Network-wide Results

Measure of Effectiveness	AM	PM
Total Number of Vehicles Processed	117,413	124,969
Total Distance Traveled (miles)	772,988	786,405
Total Delay Time (vehicle hours)	2,995	3,487
Total Travel Time (vehicle hours)	15,928	16,438
Average Delay Time per Vehicle (seconds)	92	100
Average Speed (mph)	49	48
Unmet Demand	6	2

Driver parameters were adjusted to better reflect operations in the field to calibrate the existing conditions model. The calibration effort was successful considering the complexity of the network and varying congestion conditions. Only a few vehicles were not able to enter the system; there was virtually no unmet demand in the model. Calibration results are summarized in **Table 22**.

1.1 STUDY DESCRIPTION AND PURPOSE

The I-95 express lanes (95 Express) are an innovative, lower-cost alternative to traditional highway construction offering a variety of options to increase trip time reliability. Utilizing four proven transportation techniques: tolling, transit, travel-demand management, and technology, 95 Express is focused on increasing I-95's person-throughput and providing travel options to meet travel demands today and in the future. The dynamic tolling feature promotes increased highway efficiency by encouraging off-peak travel. Ride sharing and cleaner vehicle technologies are incentivized with a toll-free ride to those choosing to travel in a hybrid vehicle or in registered car/van pools. These measures, combined with the Bus-Rapid Transit service, reduce emissions and the number of cars on the road during peak travel periods and enhance travel speeds for all drivers on the highway.

Express lanes are currently operational on I-95 in Miami-Dade County from just north of I-395/S.R. 836 to the Golden Glades area, called Phase 1. The Phase 2 construction project to extend 95 Express to Broward Boulevard in Broward County began in November 2011 and is anticipated to open in 2015. On behalf of the Florida Department of Transportation - District 4, URS is conducting a Traffic & Revenue (T&R) Study for Phase 3, which will extend from Stirling Road in Broward to Linton Boulevard in Palm Beach County.

An important influence on the outcome of traffic forecasting studies is the set of assumptions that define the extent and location of future socioeconomic (SE) growth within the area of study. The purpose of this effort is to develop SE data that will be used for forecasting revenue on 95 Express Phase 3. The systematic, focused review of land use and datasets to refine the staged future development forecasts within the study area is outlined. Within the eastern portion of Broward and Palm Beach Counties through which I-95 traverses, land has been substantially built-out for many years. However, vacant land exists, as well as a high redevelopment potential. A thorough evaluation of study area development conditions against the model development assumptions and control totals are an important component of accurate forecast results. Up-to-date population data and projections were used to test the reasonableness of and make refinements to the latest available local model SE data.

The SE data development process included selection of the base dataset and review of the data source for issues. During the review, negative growth was observed between the model's 2010 base year and 2040 future year in some geographic areas or Traffic Analysis Zones (TAZs), while county totals demonstrated reasonable growth. Additional assessments were performed to update the SE data with findings from review of the 2011 Bureau of Economic and Business Research (BEBR) data, developments of regional impact, and school enrollments. Finally, the adjusted SE databases for 2040 and 2010 were used to interpolate data for 2020 and 2030. The new data developed for this project will supersede the MPO adopted data currently used in the SERPM.

1.2 PROJECT STUDY AREA

The available datasets for the region as a whole were evaluated for appropriateness. This included the most recent county-level data update for the 2040 Long Range Transportation Plans and the dataset developed for the Seven50 Plan, a regional sustainability plan covering seven counties for the next 50 years. A detailed evaluation was conducted of an area extending 3 miles from I-95, which was selected as having the greatest potential to heavily influence traffic using the I-95 corridor. The land use study area was generally bounded by Stirling Road on the south, S.R. 7/U.S. 441 to the west, Linton Boulevard to the north, and U.S. 1/Dixie Highway on the east. The main effort focused on major developments that meet the state's requirements to be classified as a Development of Regional Impact (DRI). A map depicting the study area that was the focus of the review is provided on **Figure 1.1**. All approved or proposed DRIs in the primary study area were reviewed. Two additional DRIs outside of the 3-mile buffer were incorporated due to size, location, or regional significance in evaluating future conditions in the I-95 corridor. In all, 39 DRIs were evaluated.

1.3 TRAVEL DEMAND MODEL AND APPLICATION

The travel demand model being used for the I-95 managed lane traffic and revenue study is the Southeast Regional Planning Model (SERPM) 6.5. This is a three-county regional travel demand model that covers the southeastern portion of the state. The land use data developed from the independent review were converted to be consistent with the socioeconomic variables used in the model, which are population and number of employees (for non-residential land uses, including industrial, commercial, and service). The socioeconomic data for the major developments were assigned to the appropriate TAZs. Where major development project boundaries did not correspond precisely with the model's TAZ boundaries, the land use within the balance of the TAZ was also forecast.

2.1 STUDY DATA COLLECTION METHOD

The land use review data collection for this study was performed in multiple steps:

- Available data compilation.
- Correspondence with regional planning staff and local government staff responsible for overseeing DRI/sub-DRI development. This provided insight and understanding of conditions associated with individual DRI projects and information on other development and local initiatives regarding future land use changes within the study area.
- Aerial reconnaissance to determine what construction has occurred, as experience has demonstrated that activity is not always consistent with development documentation. This approach provided the best available information for establishing base year conditions and input to future development forecasts.

The data compiled and considered in the evaluation are:

- DRI information provided by the two regional planning councils serving the study area, the Treasure Coast Regional Planning Council (Palm Beach) and the South Florida Regional Planning Council (SFRPC).
- Department of Economic Opportunity DRI records.
- Sub-DRI larger-scale residential, non-residential, and mixed-use projects reported by the local jurisdiction (i.e., Planned Unit Developments [PUDs]).
- Local college/university campus Master Plans.
- Redevelopment plans and overlay districts potentially impacting future year development, such as Community Redevelopment Areas (CRAs), Transit Oriented Corridors (TOCs), Regional Activity Centers (RACs), and Local Activity Centers (LACs).

2.2 LOCAL AGENCY INPUT

Input was solicited through correspondence and phone interviews with the 18 municipalities within the corridor. Feedback regarding the jurisdictional development information outlined below was solicited, compiled, and considered in the evaluation.

- Approved DRI development completed to date and realistic future build-out time frames for each of the approved DRIs within the municipality.
- An inventory of larger-scale (sub-DRI level) residential, non-residential, and mixed-use projects.
- Local area redevelopment plans and overlay districts potentially impacting development in future years, such as Community Redevelopment Areas (CRAs), Transit Oriented Corridors (TOCs), Regional Activity Centers (RACs), and Local Activity Centers (LACs).

The review of Developments of Regional Impact (DRIs) located within the 3-mile buffer area of I-95 identified 39 developments, in various stages of development. Thirty-seven of these developments are shown on **Figure 1.1**; and two other developments (Briger Tract/Scripps and MainStreet at Coconut Creek) are outside of the map area. These DRIs represent various types of development, from mixed use (residential and commercial) to industrial parks. The Briger Tract Development, also known as the Scripps Florida Phase II DRI in Northern Palm Beach County, was included in the development overview at the request of District 4.

Considering data resources, local jurisdictional input, and aerial reconnaissance, a spreadsheet was developed summarizing each development, overall totals, and three model forecast scenarios (2010, 2020, and 2040). Each development was identified by name, location/ jurisdiction, relationship of the development location to the model TAZs structure, square footage by timing/phasing, land use type (e.g., residential, industrial, commercial, institutional), current development status, and projected population and employment. Aerial reconnaissance also confirmed that actual built levels of the built-out DRIs were reasonable when compared to approved levels and development documentation. This approach provided the best available information for use in establishing base year conditions and input to future development forecasts. The DRI summary spreadsheets are included in **Appendix A**, which includes a table of approved developments, as well as estimates of completion by years 2010, 2020, and 2040.

A summary of the non-DRI information, which includes sub-DRI and local area redevelopment plans and overlay districts, is provided in **Appendix B**.

3.1 EXISTING AND FUTURE DEVELOPMENT STATUS

Since the base year for the travel demand model is 2010, an effort was made to ascertain the level of development that existed during that time frame. **Table 3.1** provides a summary of the year 2010 status of all major developments analyzed. Each development was assigned an activity status from one of the following four:

- Approved/No development
- Approved/No recent development
- Active development
- Built out

In addition to the 2010 development status, **Table 3.1** shows the future year status anticipated for each major development project, according to the findings of this land use review. The land use forecasts were based not only on data and field work, but also considered characteristics unique to the individual development projects.

The history and environs of project developments under review were considered to assess growth potential. The history included information that is site specific, with reference to actual development to-date and the rate of implementation over time. For example, while a project may encompass residential and non-residential uses, the residential may have been primary in growth, with non-residential lagging. The historical rate of growth over time provides insight as

to future activity. Environs refer to other active construction or current support facilities (such as schools) near the development. Market activity in the area of the development was also considered to assess growth potential. Active similar and/or complementary land uses under construction in the area would attract home buyers and/or non-residential users based on the synergy created.

[2] Original DRI was built out. The courthouse is currently undergoing an expansion project that will result in an additional 714 ksf office land use at the site.

[3] The DRI was withdrawn, the site was ultimately developed and subsequently built out and is now named “Lauderdale Marine Center”. The development proposed in the original DRI is very similar to what was built. The land use projections reflect this.

[4] This location is now a shopping center, which has been built out.

[5] The DRI was substantially completed prior to abandonment; however the location was eventually developed and built out. The land use assessment accounts for this.

3.2 CONTROL TOTAL COMPARISONS

The 95 Express Lane T&R Study provided an opportunity to identify, review, and utilize the most up-to-date SE data available. At the time of the land use review, the ongoing Seven50 Plan had already developed a base year 2010 and future year 2040 dataset. The dataset is inclusive of the study area counties (Miami-Dade, Broward, and Palm Beach) as well as Monroe, Martin, St. Lucie, and Indian River Counties. For the purposes of this study, only the data for Miami-Dade, Broward, and Palm Beach County from the Seven50 Plan were used for comparison purposes.

Control totals for the base year 2010 were provided by the Metropolitan Planning Organizations (MPOs) in preparation for SERPM 7.0 and were based on Census data. The 2040 population control totals were obtained from the *Bureau of Economic and Business Research (BEBR) Florida Population Studies,* Volume 46, Bulletin 165, March 2013. The county control totals were compared with control totals from several other sources, including the I-75/S.R. 826 Investment Grade T&R model data, the I-95 Project Development and Environment Study model data, Seven50, and SERPM 7.

The overall comparisons of population are listed in **Table 3.2** and depicted on **Figure 3.1**. The employment data comparison is provided in tabular form in **Table 3.3** and graphically on **Figure 3.2**.

Comparison of Employment Data by Source

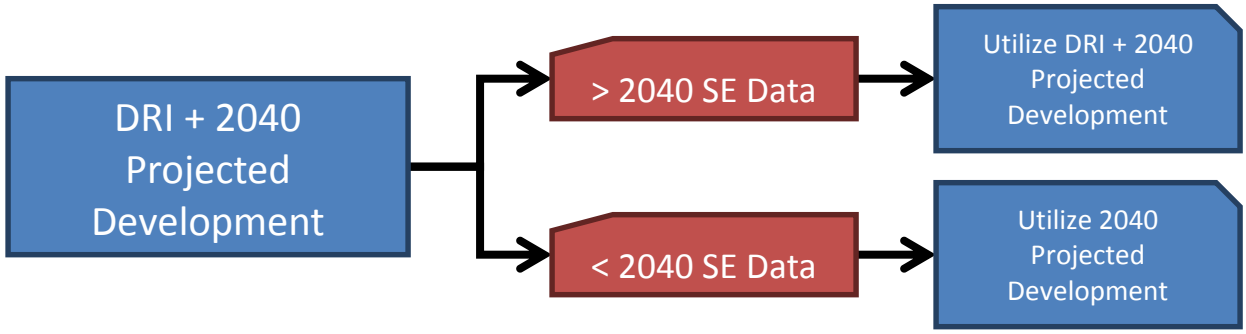
3.3 INCORPORATION OF DRI DATA

The I-95 T&R model dataset was updated to reflect the 2010 Census data and future BEBR Medium projections. The next step was the addition of DRIs in the TAZ format of the I-95 T&R model. DRI land use data were converted to the number of additional households, population, and employment and allocated to TAZs within each DRI. The methodology for incorporating the latest DRI development information and addressing redevelopment within a TAZ, for a given year, is outlined below.

- Step 1: Determine the percentage of the existing developed land for each TAZ in which new development from DRI would take place (common for all future years).
- Step 2: Use this percentage and Seven50 TAZ data to calculate allocation of TAZ SE data related to existing developed land.
- Step 3: Add estimated DRI land uses to the resulting number in Step 2.
- Step 4: If the number calculated in Step 3 is larger than the original TAZ data, the new number was used; otherwise the original TAZ data were used. The decision-making flow chart for SE data selection is shown on **Figure 3.3**.

Figure 3.3
Flow Chart for 2040 Socioeconomic Data Development



3.4 REVIEW OF NON-DRI DATA

Data for the sub-DRIs (i.e., PUDs), and municipal overlay districts (CRAs, TOCs, RACs, LACs, etc.) were provided by the local jurisdictions during the interviews. The data were separated by jurisdiction and municipal overlay district within the three-county area and included townhomes, apartments, senior living facilities, warehouses, and other developments. Additionally, the amount of projected population and employment increases were provided, with employment separated into the number of retail, office, or industrial employments. The full summary table is provided in **Appendix B**.

TAZs were listed for a majority of the developments; however, for those developments with this information missing, a TAZ was assigned after verifying the location of the development based on address field within the database. The study team reviewed the development information to confirm the TAZ socioeconomic data reflected these land uses; however, no specific adjustments were made to TAZ data based on this information.

3.5 REMOVAL OF NEGATIVE GROWTH

A comparison of Seven50 2010 and 2040 SE data indicated that although the county-level growth increment was reasonable, it showed a large number of TAZs with 2040 population and/or employment being lower than 2010 values. Also, steps to include new DRI land use information and associated adjustments to match the county-level BEBR Medium projections increased the number of zones with negative growth.

The project team decided that even though some TAZs within the region see a decline in population or employment in future, the future year TAZ data were assumed to be the same or higher than the base year 2010 for this study. The population and employment data for each future year was compared against the 2010 data and graphed in a geographic information system (GIS) to assess the location and number of negative growth TAZs. This analysis was performed for both the original Seven50 data and the I-95 T&R data.

For the final version of the TAZ data, all negative growth values were eliminated. When a future year SE data value for a TAZ was lower than 2010, it was made equal to 2010. All other TAZs with positive growth were adjusted to match the county-level BEBR projections. This process was conducted in an iterative fashion until no TAZ had negative growth between the base year and future year. **Table 3.4** shows the number of TAZs in different growth ranges, including negative growth, in the original 2040 Seven50 SE data.

Table 3.4
Number of TAZs by Growth Range in Original Socioeconomic Data from 2010 to 2040

Difference Range	Population				Households				Employment

Source: Seven50 TAZ files
PB = Palm Beach; BR = Broward; MD = Miami-Dade

3.6 ADJUSTMENT TO OTHER VARIABLES

Once the population and employment variables were finalized, the study team adjusted population-related variables to maintain the same ratios as the original Seven50 data. These variables included, but are not limited to:

- Households
- Workers
- Vehicles per Household
- School Enrollment

A special consideration was given to the school enrollment variable as high school enrollment is not directly related to just the one TAZ where that school is located, but a group of zones from which children attend that high school.

3.7 2020 AND 2030 DATA DEVELOPMENT

The opening year (2020) and an interim year (2030) SE data were also developed for this project. For the year 2020, DRI data were incorporated using the same process used for 2040. Each DRI was reviewed in detail and the percentage of the development expected to be completed by 2020 was determined. Then, the DRI land use was layered on the TAZ data using the same logic used for 2040. The 2030 TAZ data were developed by a linear interpolation between the 2020 and 2040 datasets. The interpolated data and future year SE data were then checked against the original SE data for the same year to confirm that the interpolation process was correct. As a final step, TAZ data for 2020 and 2030 were adjusted to match the county-level BEBR Medium control totals.

URS undertook an extensive effort to compile an inventory of DRI and sub-DRI land use information for the I-95 Express Lanes Phase 3 Project. All DRIs within a 3-mile buffer of the study corridor were analyzed and the resulting population and employment data were incorporated into the SERPM Model TAZ data. **Table 4.1** provides a summary of residential and non-residential development from DRIs.

Table 4.1
Summary of DRI Land Uses

Land Use	Approved	By 2010	By 2020	By 2040

Appendix B 2020 and 2040 TAZ SE Data

The Sawgrass Expressway (S.R. 869) is a tolled, 21-mile-long, limited-access facility located in northern Broward County. The majority of the facility is located on the western fringe of the Broward urban area. The facility has a north/south orientation from I-595/I-75 at the south end to the Coral Springs area to the north. The alignment changes to an east/west orientation prior to the interchange with Coral Ridge Drive on the west and continues east to the Florida's Turnpike Mainline. With traffic volumes in the area projected to increase, a series of Project Development and Environment (PD&E) studies will be conducted to evaluate the impacts of a proposed widening of the facility. The additional lanes constructed as part of the widening are currently proposed to be constructed in the form of managed express lanes.

As part of the project traffic forecasting efforts for the Sawgrass Widening PD&E studies, updated future traffic forecasts were produced. To support this effort, traffic modeling was completed using the Southeast Regional Planning Model (SERPM), which uses local population and employment data to model existing traffic conditions and to project and assign future traffic demand on area roads. Socioeconomic (SE) data are extremely important in producing accurate traffic forecasts, as future traffic demand is derived from these data. To provide reasonable traffic forecasts, the model must begin with up-to-date "base" model year data for the initial year. From this base year, future year SE data and future traffic forecasts are then developed.

To develop these forecasts, an extensive review of current and future land use in the project study area was conducted to provide the most accurate population and employment data for the base and future year forecasts. This included review of existing and proposed Developments of Regional Impact (DRIs) located within the study area and large-scale "sub-DRIs" (residential and non-residential developments with either 120+ dwelling units or over 50,000+ square feet of non-residential land use), Community Redevelopment Areas (CRAs), planned unit developments (PUDs), and master planned areas. The land use data were developed for the project model base year of 2010 and future years 2020, 2030, and 2040.

1.1 STUDY AREA

The project study area extended the entire 21-mile length of the Sawgrass Expressway, from milepost 0 (I-75/I-595) to milepost 21A/B (Florida's Turnpike). For the purposes of the study, development within a two-mile buffer along the Sawgrass Expressway corridor was analyzed, as the proximity of these developments and traffic analysis zones (TAZs) would likely produce the most significant traffic impacts to the facility in future years. **Figure 1** reveals the existing land use in the region, while **Figure 2** shows the 2-mile buffer and the DRIs evaluated.

2.1 STUDY DATA COLLECTION METHODOLOGY

The data for the land use review for this study were compiled from multiple sources using varying methods. This included:

- Review and analysis of DRIs with historical and current aerial photography to identify extent of constructed development and discover deviations from originally approved development plans.
- Field review of developments to identify where construction has begun on developments in situations where remotely accessible information was unavailable or insufficient.
- DRI information obtained from the South Florida Regional Planning Council (SFRPC)
- DRI and development information obtained from the Broward County Property Appraiser
- State of Florida Department of Economic Opportunity DRI records
- Redevelopment plans and overlay districts with future development plans such as CRAs, Transit-Oriented Corridors/Developments, Regional Activity Centers (RACs), and Local Activity Centers (LACs).
- Planned Unit Development entitlements obtained from the Broward County Planning and Zoning

2.2 LOCAL AGENCY INPUT

Municipalities located within a two-mile study area buffer zone (identified on **Figure 2**) were contacted and sent an editable summary table of known approved DRI information. Municipal planning staff members, as identified in **Table 1**, were asked to update the information, when appropriate, to identify changes in DRI status and additional sub-DRI approved development entitlements within their municipality. Respondents were asked to provide the number of approved dwelling units, dwelling unit type (single family, multi-family, etc.), square footage of non-residential development, and other development-related information that could be used to validate forecast model assumptions. Some respondents returned the table with input, while others preferred reviewing ongoing development activity via teleconference. This outreach effort identified previously unknown developments within the project study area and the status of known developments. This was a key component of the information used to update the future year model socioeconomic development data. **Table 1** provides a listing of each municipality contacted and the representative interviewed. The following tables are information provided by the municipalities. **Table 2** is a list of development information provided by the City of Lauderhill while **Table 3** is a list of development information provided by the City of Sunrise.

The model base year for the project was 2010. An updated 2010 SE dataset was used and the zones with noted development activity (DRI, substantial sub-DRI developments, and re-development districts) were updated with the latest data regarding the development's growth up to that time. Much of the land area east of the Sawgrass Expressway is largely built out. Because of this, many of the DRIs in the study area are older developments that reached build-out prior to 2010. Some developments were under construction in 2010, while some had no development activity on-site.

Future development was projected for model years 2020, 2030, and 2040. Each development was closely examined in order to produce realistic projections for development growth and rate of growth over the model years. Each development's history, likelihood for future growth, and pace of growth were established from field reviews and discussions with the city staff in which the development was located. Other factors for development growth included, but were not limited to local market activity, infrastructure improvements, growth of surrounding land uses, and area-specific growth initiatives.

Table 2 displays the 2010 status and projected future year development status for each of the identified DRIs in the project area.

Details of the major developments and land use forecast are presented in **Appendix A**.

Notes:

The original Butler Farms DRI, located near exit 18A/B on the Sawgrass Expressway, was denied. A large residential development was built at the same location. The development is now built out and the TAZ reflecting this was included in the future land use projection.

*The Florida Panthers Entertainment District is a development located at the same location as the Broward County Civic Arena; however, the development has not yet been approved at this time.

**Refers to the Coral Springs Downtown CRA Development Plan.

***DRI was approved and later abandoned. The location now features mixed residential and commercial development. The TAZ was included in the future land use projections

3.1 INCORPORATION OF DRI DATA INTO PROJECT SE DATASET

The socioeconomic (SE) data used to project future year population and employment totals were merged and balanced within the larger SERPM SE data, which utilized "medium" level growth projections from the University of Florida's Bureau of Economic and Business Research (BEBR). The SERPM zonal data were updated by incorporating the growth associated with specific developments into the overall total for each zone. This process is outlined below:

- Identify the TAZs within the project area with known development (DRI, sub-DRI, CRAs, etc.), known as "development zones." The SE data updates were applied specifically to these TAZs.
- Establish Population and Employment growth totals for model base year (2010) and future years (2020, 2030, and 2040) for the development zones identified in the previous step.
- Establish Population and Employment totals for remaining areas within the TAZ not within a development zone.
- Combine totals from the previous two steps to establish a new population and employment projection for the zone.

The quantification of current and future land use from this effort was integrated into the model by converting the dwelling units and built non-residential square footage into residential population and employees, respectively. From this conversion, the numbers of population and employees were then distributed within the model by assigning the growth to the corresponding TAZ. The SE data were increased in each TAZ throughout each model year in which growth took place. The growth was assigned to each zone based on known development patterns within the area. An analysis was also completed to evaluate the amount of developable land available within each TAZ so that growth is not assigned to "built out" TAZs, those without the capacity for more growth.

3.1.1 Incorporation of Sub-DRI Data into Project SE Dataset

Data for the sub-DRI developments, PUDs, CRA redevelopment districts, transit-oriented corridors, etc., were collected via research and coordination with area municipalities and the South Florida Regional Planning Council. Data were provided in terms of numbers of proposed single-family and multi-family units and square footage of retail, office, and/or industrial buildings. Hotel information, when applicable, was provided in terms of the proposed number of hotel rooms.

SE data within TAZs in close proximity to the Sawgrass Expressway but not containing a DRI or identified non-DRI development were also examined for appropriateness of the population and employment growth totals. Because of their locations, these zones were of particular importance as they have a high likelihood of affecting traffic volumes on the facility if projections are unusually high or low.

3.1.2 Adjustments to Zones with Negative Zonal Growth

In the original SERPM zonal data, some zones would see reductions over time in population that would result in increases in employment or zones would see reductions in employment but would result in increases in population. These zones were identified as "redevelopment zones," reflecting the phenomena of older residential development being replaced by office/commercial development or older non-residential development being replaced by new single-family or multi-family developments. Reflecting this in the SE data can sometimes result in negative growth in some land uses over time; however, for the purposes of this study, negative zonal growth was not permitted and was eliminated by assuming zero growth in zones where this type of development was projected to occur or in areas projected for flat/no growth.

3.2 FUTURE YEAR DATA DEVELOPMENT

In addition to developing the 2010 base year data, SE data were also developed for years 2020, 2030 and 2040. For the 2020 data, many of the DRIs approaching build-out were assumed to have been completed by this time. The land use data were adjusted to reflect this. For the 2040 outer year, it was assumed that nearly all of the project area DRIs would be either at or near build-out, with non-DRI developments either at or near build-out as well. For the 2030 interim year, those developments that were not projected to be at or near build-out at that time had growth allocated to them via annual growth rates. The probability of developments reaching build out by a particular model year was determined from input received from city staff and analysis of annual growth rates associated with each development.

With these growth assumptions; population and employment growth was distributed to each corresponding TAZ where the identified development was located. Each TAZ was analyzed in order to ensure that growth was not attributed to zones that had become "built out" in a previous model year.

A complete table of the study area TAZs and future year SE Data are presented in **Appendix B**

Despite the dense nature of development within Broward County (17th most populous in the United States), population and employment growth is expected to continue at a fairly consistent rate. As economic conditions continue to improve statewide and nationally, residential real estate and business investment will continue to spur growth in the region. The county is also well positioned to take advantage of the state's new emphasis on freight/port economic activity. Though growth is not expected to return to pre-recession levels, the county, with its large residential population and broad economic base, is positioned well for consistent growth into the future.

This section presents descriptions for each of the major developments evaluated, including a summary of land use for the approved developments, and 2010 base year and forecasts for the planning years 2020, 2030, and 2040. Note that developments are often approved for more land use entitlements than what is eventually completed at build-out. The developments are listed in alphabetical order.

84 South DRI

Located in the City of Sunrise, the development was first approved in 1977. Through various changes to the originally approved entitlements, the development was approved for 2,917 dwelling units, 360,000 square feet of office use, 122,000 square feet of retail use, and 440,000 square feet of industrial use. The development is currently built out.

Status / Year	Residential Units	Hotel/Motel Rooms	Retail (SF)	Office (SF)	Industrial (SF)	Warehouse (SF)	Other
Built Out	2,917	0	122,000	360,000	444,000	0	0

Amerifirst Tract DRI

Located in the City of Sunrise, the development was first approved in 1987. The development was originally approved for 1,998 dwelling units, 1.07 million square feet of office use, 442,480 square feet of retail use, and 1.28 million square feet of industrial use. A new American Express Corporate Office building will be built on the tract. The development is projected to reach build-out by 2017.

Status / Year	Residential Units	Hotel/Motel Rooms	Retail (SF)	Office (SF)	Industrial (SF)	Warehouse (SF)	Other
Approved	2,370	0	442,480	1,074,653	0	0	0
2010	2,320	250	391,250	573,960	0	0	0
2020	2,320	250	405,250	1,396,810	0	0	0
2030	2,320	250	426,000	1,400,000	0	0	0
2040	2,320	250	426,000	1,400,000	0	0	0

Arvida Increment (ECUMED) – Indian Trace I DRI

Located in the City of Weston, the development was first approved in 1984. The development was approved for 663 dwelling units, 2.3 million square feet of office use, and 168,000 square feet of industrial use. The development is expected to reach build-out by 2017.

Status / Year	Residential Units	Hotel/Motel Rooms	Retail (SF)	Office (SF)	Industrial (SF)	Warehouse (SF)	Other
Approved	1,600	1,500	0	2,300,000	168,000	0	0
2010	1,600	100	74,600	1,023,523	2,200,000	79,190	0
2020	1,600	100	75,000	1,023,523	2,400,000	79,190	0
2030-2040	1,600	100	75,000	1,023,523	2,471,590	79,190	0

Arvida Increment – Indian Trace II DRI

Located in the City of Weston, the development was first approved in 1979. The development was approved for 14,953 dwelling units, 3.3 million square feet of office use, and 1.4 million square feet of retail use. The development is currently built out.

Status / Year	Residential Units	Hotel/Motel Rooms	Retail (SF)	Office (SF)	Industrial (SF)	Warehouse (SF)	Other
Built Out	14,953	0	1,400,000	3,300,000	0	0	0
2010	13,852	535	766,580	1,930,595	338,470	78,100	0

2020 & 2040 No-Build Freeway HCS Analysis

FREEWAY WEAVING WORKSHEET

General Information

Analyst	
Agency/Company	AECOM
Date Performed	
Analysis Time Period	AM

Site Information

Freeway/Dir of Travel	I-95 NB
Weaving Segment Location	Seg 1-Bet Copans & Sample
Analysis Year	No-Build 2020

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	One-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	1820ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	4435	0.95	3	0	1.5	1.2	0.985	1.00	4738
V_{RF}	345	0.92	2	0	1.5	1.2	0.990	1.00	379
V_{FR}	810	0.92	2	0	1.5	1.2	0.990	1.00	889
V_{RR}	0	0.92	0	0	1.5	1.2	1.000	1.00	0
V_{NW}	4738							V =	6006
V_W	1268								
VR	0.211								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	1268 lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	1640 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	1192 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	2832 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	604

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	5924 veh/h	Weaving intensity factor, W	0.320
Weaving segment capacity, c_w	8603 veh/h	Weaving segment speed, S	54.3 mph
Weaving segment v/c ratio	0.689	Average weaving speed, S_W	56.7 mph
Weaving segment density, D	27.7 pc/mi/ln	Average non-weaving speed, S_{NW}	53.7 mph
Level of Service, LOS	C	Maximum weaving length, L_{MAX}	4650 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	1595 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	771 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	2366 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	299

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6696 veh/h	Weaving intensity factor, W	0.537
Weaving segment capacity, c_w	8315 veh/h	Weaving segment speed, S	51.7 mph
Weaving segment v/c ratio	0.805	Average weaving speed, S_W	50.8 mph
Weaving segment density, D	32.9 pc/mi/ln	Average non-weaving speed, S_{NW}	51.9 mph
Level of Service, LOS	D	Maximum weaving length, L_{MAX}	4575 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = 1814.15 (Equation 13-6 or 13-7)

P_{FM} = 0.604 using Equation (Exhibit 13-6)

V_{12} = 2911 pc/h

V_3 or V_{av34} 1908 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☑ Yes ☐ No

If Yes,V_{12a} = 2911 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}	5511	Exhibit 13-8		No

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}	3603	Exhibit 13-8	4600:All	No

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734 v_R + 0.0078 V_{12} - 0.00627 L_A$

D_R = 27.3 (pc/mi/ln)

LOS = C (Exhibit 13-2)

Speed Determination

M_S = 0.369 (Exibit 13-11)

S_R= 59.7 mph (Exhibit 13-11)

S_0= 64.9 mph (Exhibit 13-11)

S = 61.4 mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = using Equation (Exhibit 13-7)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F		Exhibit 13-8		
$V_{FO} = V_F - V_R$		Exhibit 13-8		
V_R		Exhibit 13-10		

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086 V_{12} - 0.009 L_D$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

D_s = (Exhibit 13-12)

S_R= mph (Exhibit 13-12)

V_{RR}	0	0.95	0	0	1.5	1.2	1.000	1.00	0
V_{NW}	4231							V =	6338
V_W	2107								
VR	0.332								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	812 lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	1185 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	1093 lc/h
Minimum FR lane changes, LC_{FR}	0 lc/pc	Total lane changes, LC_{ALL}	2278 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	542

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6256 veh/h	Weaving intensity factor, W	0.269
Weaving segment capacity, c_w	7113 veh/h	Weaving segment speed, S	57.1 mph
Weaving segment v/c ratio	0.879	Average weaving speed, S_W	58.4 mph
Weaving segment density, D	27.7 pc/mi/ln	Average non-weaving speed, S_{NW}	56.5 mph
Level of Service, LOS	C	Maximum weaving length, L_{MAX}	5934 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Date Performed	
Analysis Time Period	AM

Site Information

Freeway/Dir of Travel	I-95 SB
Weaving Segment Location	Seg 14- Bet Sample & Copans
Analysis Year	No-Build 2020

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	One-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	1650ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	3575	0.95	3	0	1.5	1.2	0.985	1.00	3820
V_{RF}	1790	0.92	2	0	1.5	1.2	0.990	1.00	1965
V_{FR}	605	0.92	2	0	1.5	1.2	0.990	1.00	664
V_{RR}	0	0.95	0	0	1.5	1.2	1.000	1.00	0
V_{NW}	3820							V =	6449
V_W	2629								
VR	0.408								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	551

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6367 veh/h	Weaving intensity factor, W	
Weaving segment capacity, c_w	5800 veh/h	Weaving segment speed, S	mph
Weaving segment v/c ratio	1.098	Average weaving speed, S_W	mph
Weaving segment density, D	pc/mi/ln	Average non-weaving speed, S_{NW}	mph
Level of Service, LOS	F	Maximum weaving length, L_{MAX}	6767 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Inputs

Upstream Adj Ramp

☐ Yes ☐ On

☑ No ☐ Off

L_{up} = ft

V_u = veh/h

Freeway Number of Lanes, N	3
Ramp Number of Lanes, N	1
Acceleration Lane Length, L_A	500
Deceleration Lane Length L_D	
Freeway Volume, V_F	5160
Ramp Volume, V_R	1460
Freeway Free-Flow Speed, S_{FF}	70.0
Ramp Free-Flow Speed, S_{FR}	50.0

Downstream Adj Ramp

☑ Yes ☑ On

☐ No ☐ Off

L_{down} = 1950 ft

V_D = 920 veh/h

Conversion to pc/h Under Base Conditions

(pc/h)	V (Veh/hr)	PHF	Terrain	%Truck	%Rv	f_{HV}	f_p	v = V/PHF x f_{HV} x f_p
Freeway	5160	0.95	Level	3	0	0.985	1.00	5513
Ramp	1460	0.92	Level	2	0	0.990	1.00	1603
UpStream								
DownStream	920	0.92	Level	2	0	0.990	1.00	1010

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = 0.591 using Equation (Exhibit 13-6)

V_{12} = 3261 pc/h

V_3 or V_{av34} 2252 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☑ Yes ☐ No

If Yes,V_{12a} = 3261 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}	7116	Exhibit 13-8		No

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}	4864	Exhibit 13-8	4600:All	Yes

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = 39.5 (pc/mi/ln)

LOS = E (Exhibit 13-2)

Speed Determination

M_S = 0.776 (Exibit 13-11)

S_R= 48.3 mph (Exhibit 13-11)

S_0= 63.7 mph (Exhibit 13-11)

S = 52.3 mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = using Equation (Exhibit 13-7)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

Analyst	
Agency/Company	AECOM
Date Performed	
Analysis Time Period	AM

Site Information

Freeway/Dir of Travel	I95/SB
Weaving Segment Location	Seg 2-Bet On from Exp & Off
Analysis Year	No-Build 2040

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	Two-Sided	Segment type	Freeway
Weaving number of lanes, N	3	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	5085ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	3585	0.95	3	0	1.5	1.2	0.985	1.00	3830
V_{RF}	1265	0.92	2	0	1.5	1.2	0.990	1.00	1389
V_{FR}	1285	0.92	2	0	1.5	1.2	0.990	1.00	1411
V_{RR}	145	0.92	2	0	1.5	1.2	0.990	1.00	159
V_{NW}	6630							V =	6789
V_W	159								
VR	0.023								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	0 lc	Minimum weaving lane changes, LC_{MIN}	477 lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	848 lc/h
Minimum RF lane changes, LC_{RF}	0 lc/pc	Non-weaving lane changes, LC_{NW}	3167 lc/h
Minimum FR lane changes, LC_{FR}	0 lc/pc	Total lane changes, LC_{ALL}	4015 lc/h
Minimum RR lane changes, LC_{RR}	3 lc/pc	Non-weaving vehicle index, I_{NW}	2360

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6704 veh/h	Weaving intensity factor, W	0.188
Weaving segment capacity, c_w	6899 veh/h	Weaving segment speed, S	55.8 mph
Weaving segment v/c ratio	0.972	Average weaving speed, S_W	61.3 mph
Weaving segment density, D	40.5 pc/mi/ln	Average non-weaving speed, S_{NW}	55.7 mph
Level of Service, LOS	E	Maximum weaving length, L_{MAX}	5944 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

V_{NW}	5193							V =	7751
V_W	2558								
VR	0.330								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	lc/h
Minimum FR lane changes, LC_{FR}	0 lc/pc	Total lane changes, LC_{ALL}	lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	7649 veh/h	Weaving intensity factor, W	
Weaving segment capacity, c_w	7165 veh/h	Weaving segment speed, S	mph
Weaving segment v/c ratio	1.067	Average weaving speed, S_W	mph
Weaving segment density, D	pc/mi/ln	Average non-weaving speed, S_{NW}	mph
Level of Service, LOS	F	Maximum weaving length, L_{MAX}	5908 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Ramp Free-Flow Speed, S_{FR}	45.0

Downstream Adj Ramp

☐ Yes ☐ On

☑ No ☐ Off

L_{down} = ft

V_D = veh/h

Conversion to pc/h Under Base Conditions

(pc/h)	V (Veh/hr)	PHF	Terrain	%Truck	%Rv	f_{HV}	f_p	v = V/PHF x f_{HV} x f_p
Freeway	6480	0.95	Level	3	0	0.985	1.00	6923
Ramp	1310	0.92	Level	2	0	0.990	1.00	1438
UpStream	770	0.92	Level	2	0	0.990	1.00	845
DownStream								

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = using Equation (Exhibit 13-6)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes, V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

M_S = (Exibit 13-11)

S_R= mph (Exhibit 13-11)

S_0= mph (Exhibit 13-11)

S = mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.521 using Equation (Exhibit 13-7)

V_{12} = 4294 pc/h

V_3 or V_{av34} 2629 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☑ No

If Yes, V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F	6923	Exhibit 13-8	7200	No
$V_{FO} = V_F - V_R$	5485	Exhibit 13-8	7200	No
V_R	1438	Exhibit 13-10	2100	No

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}	4294	Exhibit 13-8	4400:All	No

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086\ V_{12} - 0.009\ L_D$

D_R = 40.8 (pc/mi/ln)

LOS = E (Exhibit 13-2)

Speed Determination

D_s = 0.427 (Exhibit 13-12)

S_R= 58.0 mph (Exhibit 13-12)

S_0= 71.3 mph (Exhibit 13-12)

S = 62.1 mph (Exhibit 13-13)

V_W	2547								
VR	0.350								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	655

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	7185 veh/h	Weaving intensity factor, W	
Weaving segment capacity, c_w	6758 veh/h	Weaving segment speed, S	mph
Weaving segment v/c ratio	1.063	Average weaving speed, S_W	mph
Weaving segment density, D	pc/mi/ln	Average non-weaving speed, S_{NW}	mph
Level of Service, LOS	F	Maximum weaving length, L_{MAX}	6125 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

SW 10th Street at I-95 – Alternatives Analysis Memorandum

AECOM

MEMORANDUM

Date: June 29, 2018

To: Hui Zhao, P.E., FDOT D4
Cesar Martinez, P.E., FDOT D4

From: Pramod Choudhary, P.E., PTOE, AECOM
Andrew Velasquez, P.E., PTOE, AECOM/Florida's Turnpike

Copies: Anson Sonnet, P.E., FDOT D4
Vilma Croft, P.E., HNTB
Lisa Dykstra, P.E., RS&H

Subject: SW 10th Street at I-95 – Alternatives Analysis Memorandum

FPID(s): 436964-1 and 439891-1

State Road: SW 10th Street (S.R. 869)

County: Broward

INTRODUCTION

The purpose of this memorandum is to document the various alternatives that were developed and analyzed for the I-95 and SW 10th Street PD&E Study (FPID 436964-1) and the SW 10th Street Connector PD&E Study (FPID 439891-1). Traffic evaluation was conducted for two different Build Alternatives (a depressed Center Alignment and a depressed Northern Alignment for the proposed managed lanes), with six different managed lanes ingress and egress configurations resulting in a total of twelve (12) Build Alternatives. In addition, 2016 Existing Conditions, 2040 No-Build Conditions, and 2040 Partial Build Conditions were also evaluated.

The fifteen scenarios (existing 2016 conditions, 2040 No-Build conditions, 2040 Partial Build conditions, and twelve 2040 Build Concept conditions) were first analyzed by conducting a Tier 1 volume to capacity ratio analysis of the SW 10th Street local lanes and proposed managed lanes. In addition, the vehicle-miles traveled in the managed lanes during the peak hours for each of the twelve Build Concepts were calculated and compared. Subsequently, a Tier 2 intersection operations analysis was completed for the signalized intersections along SW 10th Street. A Tier 2 freeway analysis of the proposed managed lanes connecting the Sawgrass, Florida's Turnpike and I-95 was also completed. The peak hour traffic operations analysis results were reviewed to screen the twelve Build Concepts for any traffic operations fatal flaws, and the comparison of results was used to identify the most advantageous Build Concepts to be considered further.

Overall, Tier 1 and Tier 2 analyses resulted in the selection of the North Build Alternative 3D-1.3 and the Center Build Alternative 3D-1.3 as the top ranked alternatives. Please refer to the *Traffic Analysis Technical Memorandum* dated May 4, 2018 and prepared by RS&H. VISSIM microsimulation was conducted to further evaluate these two shortlisted alternatives. The North Build Alternative 3D-1.3 was found to provide better operating conditions than the Center Build Alternative. Hence, the North Build Alternative 3D-1.3 was operationally considered as the best Build Alternative and was further refined to improve the overall operations. One of the refinements was to modify the Newport Drive intersection to eliminate the northbound and southbound through and left-turn movements from the intersection and convert the unsignalized intersection of SW 12th Avenue and Newport Drive into a roundabout.

The documentation provided herein includes the lane geometry, traffic volumes, and intersection analysis for the No-Build, Partial Build and Build 3D-1.3 alternatives along SW 10th Street from Military Trail to FAU Research Boulevard. In addition, VISSIM traffic simulation results of the shortlisted alternatives have also been included to help in the determination of the operationally best alternative.

LANE GEOMETRY

Figures 1 through **3** provide the lane geometry for the future year alternatives described below:

No-Build Alternative - This alternative assumes future capacity with the Turnpike Mainline widening, 95 Express Phase 3 Lanes and a portion of the Sawgrass Expressway Widening from Sunrise Boulevard to U.S. 441. No improvements are included along the Sawgrass Expressway from U.S. 441 to Powerline Road and along SW 10th Street. The No-Build includes the intersection improvements under construction at the SW 10th Street/I-95 interchange and Hillsboro Boulevard/I-95 interchange.

Partial Build Alternative - In addition to the No-Build improvements, the Partial-Build alternative assumes:

- Full Interchange at Turnpike Mainline/Sawgrass Expressway/SW 10th Street.
- Direct Connections to northbound and southbound 95 Express.
- Modification to the I-95 interchange ramp terminals to include additional turn lanes and a new westbound to northbound ramp.

This alternative assumes that the 95 Express direct connect ramps will extend west of Military Trail via grade-separated ramps. The full interchange at Turnpike Mainline/Sawgrass Expressway will connect to an at-grade SW 10th Street arterial west of the Powerline Road intersection. SW 10th Street also remains as a four-lane arterial between Powerline Road and Military Trail.

Build SW 10th Street Alternative 3D-1.3 North Alignment and Modified Newport Drive Intersection (North Modified) - In addition to the Partial-Build improvements, the Build alternative includes:

- Four managed lanes (2 in each direction) along SW 10th Street with grade separation at Powerline Road and Military Trail intersections.
- Managed lane ingress and egress ramps on either side of the Military Trail intersection.
- Removal of the northbound and southbound left turns at Newport Drive with additional northbound and southbound right turn lanes.
- Access from eastbound SW 12th Avenue to westbound SW 10th Street managed lanes.
- A Roundabout at the intersection of East Newport Center Drive and West Newport Center Drive.

Through coordination with the SW 10th Street Connector PD&E team, 12 Build Alternatives (3D 1.1 through 1.6 Center and North Alignments) were developed to evaluate the best potential ingress/egress combination along SW 10th Street. Build Alternatives 3D-1.3 Center and 3D-1.3 North alignments reflected the highest ranked ingress/egress combination through the tiered screening process. For simplicity, in comparing the intersection analysis results, Alternative 3D 1.3 North alignment is compared against the Partial and No-Build alternatives.

TRAFFIC FORECASTS

Figures 4 through **6** show the 2040 Directional Design Hour Volumes (DDHVs) for No-Build, Partial Build and Build 3D.1.3 alternatives. The No-Build and Partial Build alternatives were provided in the *Draft SW 10th Street Project Traffic Forecast Memorandum* (PTFM), dated January 2018. The PTFM also included the forecasts for Build Alternative 3-D 1.1. The DDHVs for Build Alternative 3D-1.3 North Modified were developed in coordination with the SW 10th Street Connector PD&E team using output from the Express Lanes Time-of-Day Model and then manually reassigning traffic to accommodate median closures or restricted movements.

INTERSECTION ANALYSIS RESULTS

Tables 1 through **3** present the 2040 level of service and control delays (in seconds/vehicle) for the No-Build, Partial Build, and Build 3D1.3 North Alignment (Modified), respectively, for the SW 10th Street intersections from Military Trail to FAU Research Boulevard. The analysis was conducted using Synchro software and reported as Highway Capacity Manual 2000 output, consistent with the SW 10th Street PTFM methodology. The results show the following:

2040 AM Peak Hour

1. The analysis generally shows a progressive improvement (reduction) in overall intersection delays from the No-Build to Partial Build to Build alternatives.
2. At the Military Trail intersection, the Partial Build alternative is expected to reduce the delay by more than 62 seconds/vehicle from the No-Build alternative and the Build alternative would further reduces it by another 34 seconds/vehicle. The Build alternative provides LOS D at this intersection.
3. The Newport Center Drive intersection is expected to operate at LOS D, C and B under the No-Build, Partial Build and Build alternatives, respectively.
4. The I-95 SB Ramp intersection is expected to operate at LOS E, D and D under the No-Build, Partial Build and Build alternatives, respectively. The average vehicle delays between the Partial Build and Build alternatives are comparable.
5. The I-95 NB Ramp intersection is expected to operate at LOS F, C and C under the No-Build, Partial Build and Build alternatives, respectively. The Partial Build and Build alternatives would reduce the overall intersection delays by more than 54 seconds per vehicle when compared with the No-Build alternative. The average vehicle delays between the Partial Build and Build alternatives are comparable.
6. The FAU Research Park Boulevard is expected to operate at LOS D under the No-Build, Partial Build and Build alternatives with comparable delays.

2040 PM Peak Hour

1. The analysis generally shows a progressive improvement (reduction) in overall intersection delays from the No-Build to Partial Build to Build alternatives.
2. At the Military Trail intersection, the Partial Build alternative would reduce the delay by 72 seconds/vehicle from the No-Build alternative and the Build alternative would further reduces it by another 31 seconds/vehicle. The intersection is expected to operate at LOS F, F and D under the No-Build, Partial Build and Build alternatives, respectively.
3. The Newport Center Drive intersection is expected to operate at LOS F, E and C under the No-Build, Partial Build and Build alternatives, respectively. The Partial Build alternative would reduce the delay by 19 seconds/vehicle from the No-Build alternative and the Build alternative would further reduces it by more than 34 seconds/vehicle.
4. The I-95 SB Ramp intersection is expected to operate at LOS D, C and D under the No-Build, Partial Build and Build alternatives, respectively.
5. The I-95 NB Ramp intersection is expected to operate at LOS F, C and C under the No-Build, Partial Build and Build alternatives, respectively. The Partial Build and Build alternatives would reduce the overall intersection delays by more than 124 seconds per vehicle when compared with the No-Build alternative. The average vehicle delays between the Partial Build and Build alternatives are comparable.

6. The FAU Research Park Boulevard is expected to operate at LOS E, E and D under the No-Build, Partial Build and Build alternatives. The Partial Build would reduce the delay by more than 19 seconds per vehicle and the Build alternative would further reduce it by 5 seconds per vehicle.

VISSIM Simulation of the North and Center Build Alternative 3D-1.3

As discussed above, based on the VISSIM traffic simulation of the North and Center Build Alternatives, certain refinements were made to the Build concepts. Therefore, hereinafter, the 3D-1.3 Build Alternatives have been identified as "Base" and "Modified". The modified alternative incorporates the elimination of the northbound and southbound through and left-turn movements from the intersection of SW 10th Street and Newport Drive and the conversion of the currently unsignalized intersection of SW 12th Avenue and Newport Drive into a roundabout.

Evaluation of North Build Alternative Base and Center Build Alternative Base

VISSIM micro-simulation analysis was conducted for the Base condition for North and Center Build Alternatives 3D-1.3. For the Center Base alignment, VISSIM micro-simulation analysis identified significant constraints in the WB direction between Military Trail and the I-95 ramps. The primary reason for the traffic congestion and backup was insufficient intersection throughput capacity at Newport Center Drive and constrained weaving operations accessing the WB express lane ingress. In the North Base alignment, the express lanes are relocated to the north side of SW 10th Street from the center location thereby providing better operating conditions than the Center Base alignment. **Tables 4A** and **4B** summarize the VISSIM network-wide summary. The green highlighting indicates the alternative with better operations. **Figures 7A** and **7B** depict the VISSIM network for the North Base and Center Base alternatives.

Findings

The VISSIM results indicate that in the Build Option 1.3 North Base, there is significant reduction in latent (i.e., unmet) demand and delay in the AM and PM conditions. Based on these traffic operations results the North Build Alternative Base preforms better than the Center Build Alternative Base. Therefore, the Center Build Alternative was eliminated and North Build Alternative Base was advanced further in the PD&E process for additional concept refinements to improve the traffic operations at the Newport Center Drive intersection.

Evaluation of North Build Alternative Base and North Build Alternative Modified

To improve traffic operations and achieve acceptable traffic operations at all study area intersections, the North Build Alternative Base was further refined by eliminating the NB and SB through and left-turn movements at the Newport Center Drive and SW 10th Street intersection. The traffic from the eliminated movements was reassigned via the loop connector which passes under SW 10th Street along the railway line. **Tables 5A** and **5B** summarize the VISSIM network-wide summary. The green highlighting indicates the alternative with better operations. **Figures 8A** and **8B** depict the VISSIM network for the North Modified and Center Modified alternatives.

Findings

The VISSIM results indicate that in the North Build Alternative Modified, there is improvement in delay, speed and travel time in the AM condition. In the PM condition, there is significant reduction in latent (i.e., unmet) demand and delay along with improvement in delay, speed and travel time. Hence, the North Build Alternative Modified was operationally found to be the best alternative for further consideration in the PD&E process.

Roundabout vs. Stop Controlled Intersection Analysis (SW 12th Avenue & Newport Center Drive)

The intersection of SW 12th Avenue and Newport Center Drive is currently a two-way stop controlled intersection with the NB and SB approaches as free movements and EB and WB movements as Stop controlled. In future years, it is projected that the truck activity at this intersection would increase causing potential safety concerns. Therefore, to mitigate any potential traffic operational safety concerns, a signal and a roundabout option were considered for this intersection. However, the signal warrant analysis was not satisfied for the intersection due to low traffic volume so the signal option was eliminated and a roundabout option was considered for traffic operational analysis comparison with the Stop controlled intersection.

Tables 6A and **6B** summarize the VISSIM analysis results for roundabout and Stop controlled intersection conditions. The VISSIM analysis indicates that the traffic operational analysis is very similar between roundabout and Stop controlled intersection. However, a roundabout has significant safety benefits over a Stop controlled intersection. According to FHWA – Technical Summary on Roundabouts, numerous studies have shown significant safety improvements at intersections converted from conventional forms to roundabouts. The physical shape of roundabouts eliminate crossing conflicts that are present at conventional intersections, thus reducing the total number of potential conflict points and the most severe of those conflict points. The most comprehensive and recent study showed overall reductions of 35 percent in total crashes and 76 percent in injury crashes. Severe, incapacitating injuries and fatalities are rare, with one study reporting 89-percent reduction in these types of crashes and another reporting 100-percent reduction in fatalities. Therefore, a roundabout is recommended at the intersection of SW 12th Avenue and Newport Center Drive.

North Build Alternative 3D-1.3 Modified – Evaluation of Eastbound Express Lane Egress Merge Conditions

Due to the proximity of the eastbound express lane egress to the Newport Center Drive intersection and the I-95 southbound ramp intersection, significant weaving and lane changes are induced in the eastbound direction. In order to provide the best operating conditions, the eastbound express lane egress was evaluated using VISSIM traffic simulation for the following merge conditions:

- Inside Egress Merge (see **Figure 9**)
- Outside Egress Merge (See **Figure 10**)
- Both Inside and Outside Egress Merge (See **Figure 11**)

Table 7 summarizes the results of the VISSIM analysis of the express lane egress merge conditions. The analysis shows that a combination of both inside and outside merge would provide the best operating conditions in the eastbound direction. **Figure 12** depicts the both inside and outside egress merge conditions with a roundabout at the intersection of Newport Center Drive and SW 12th Avenue.

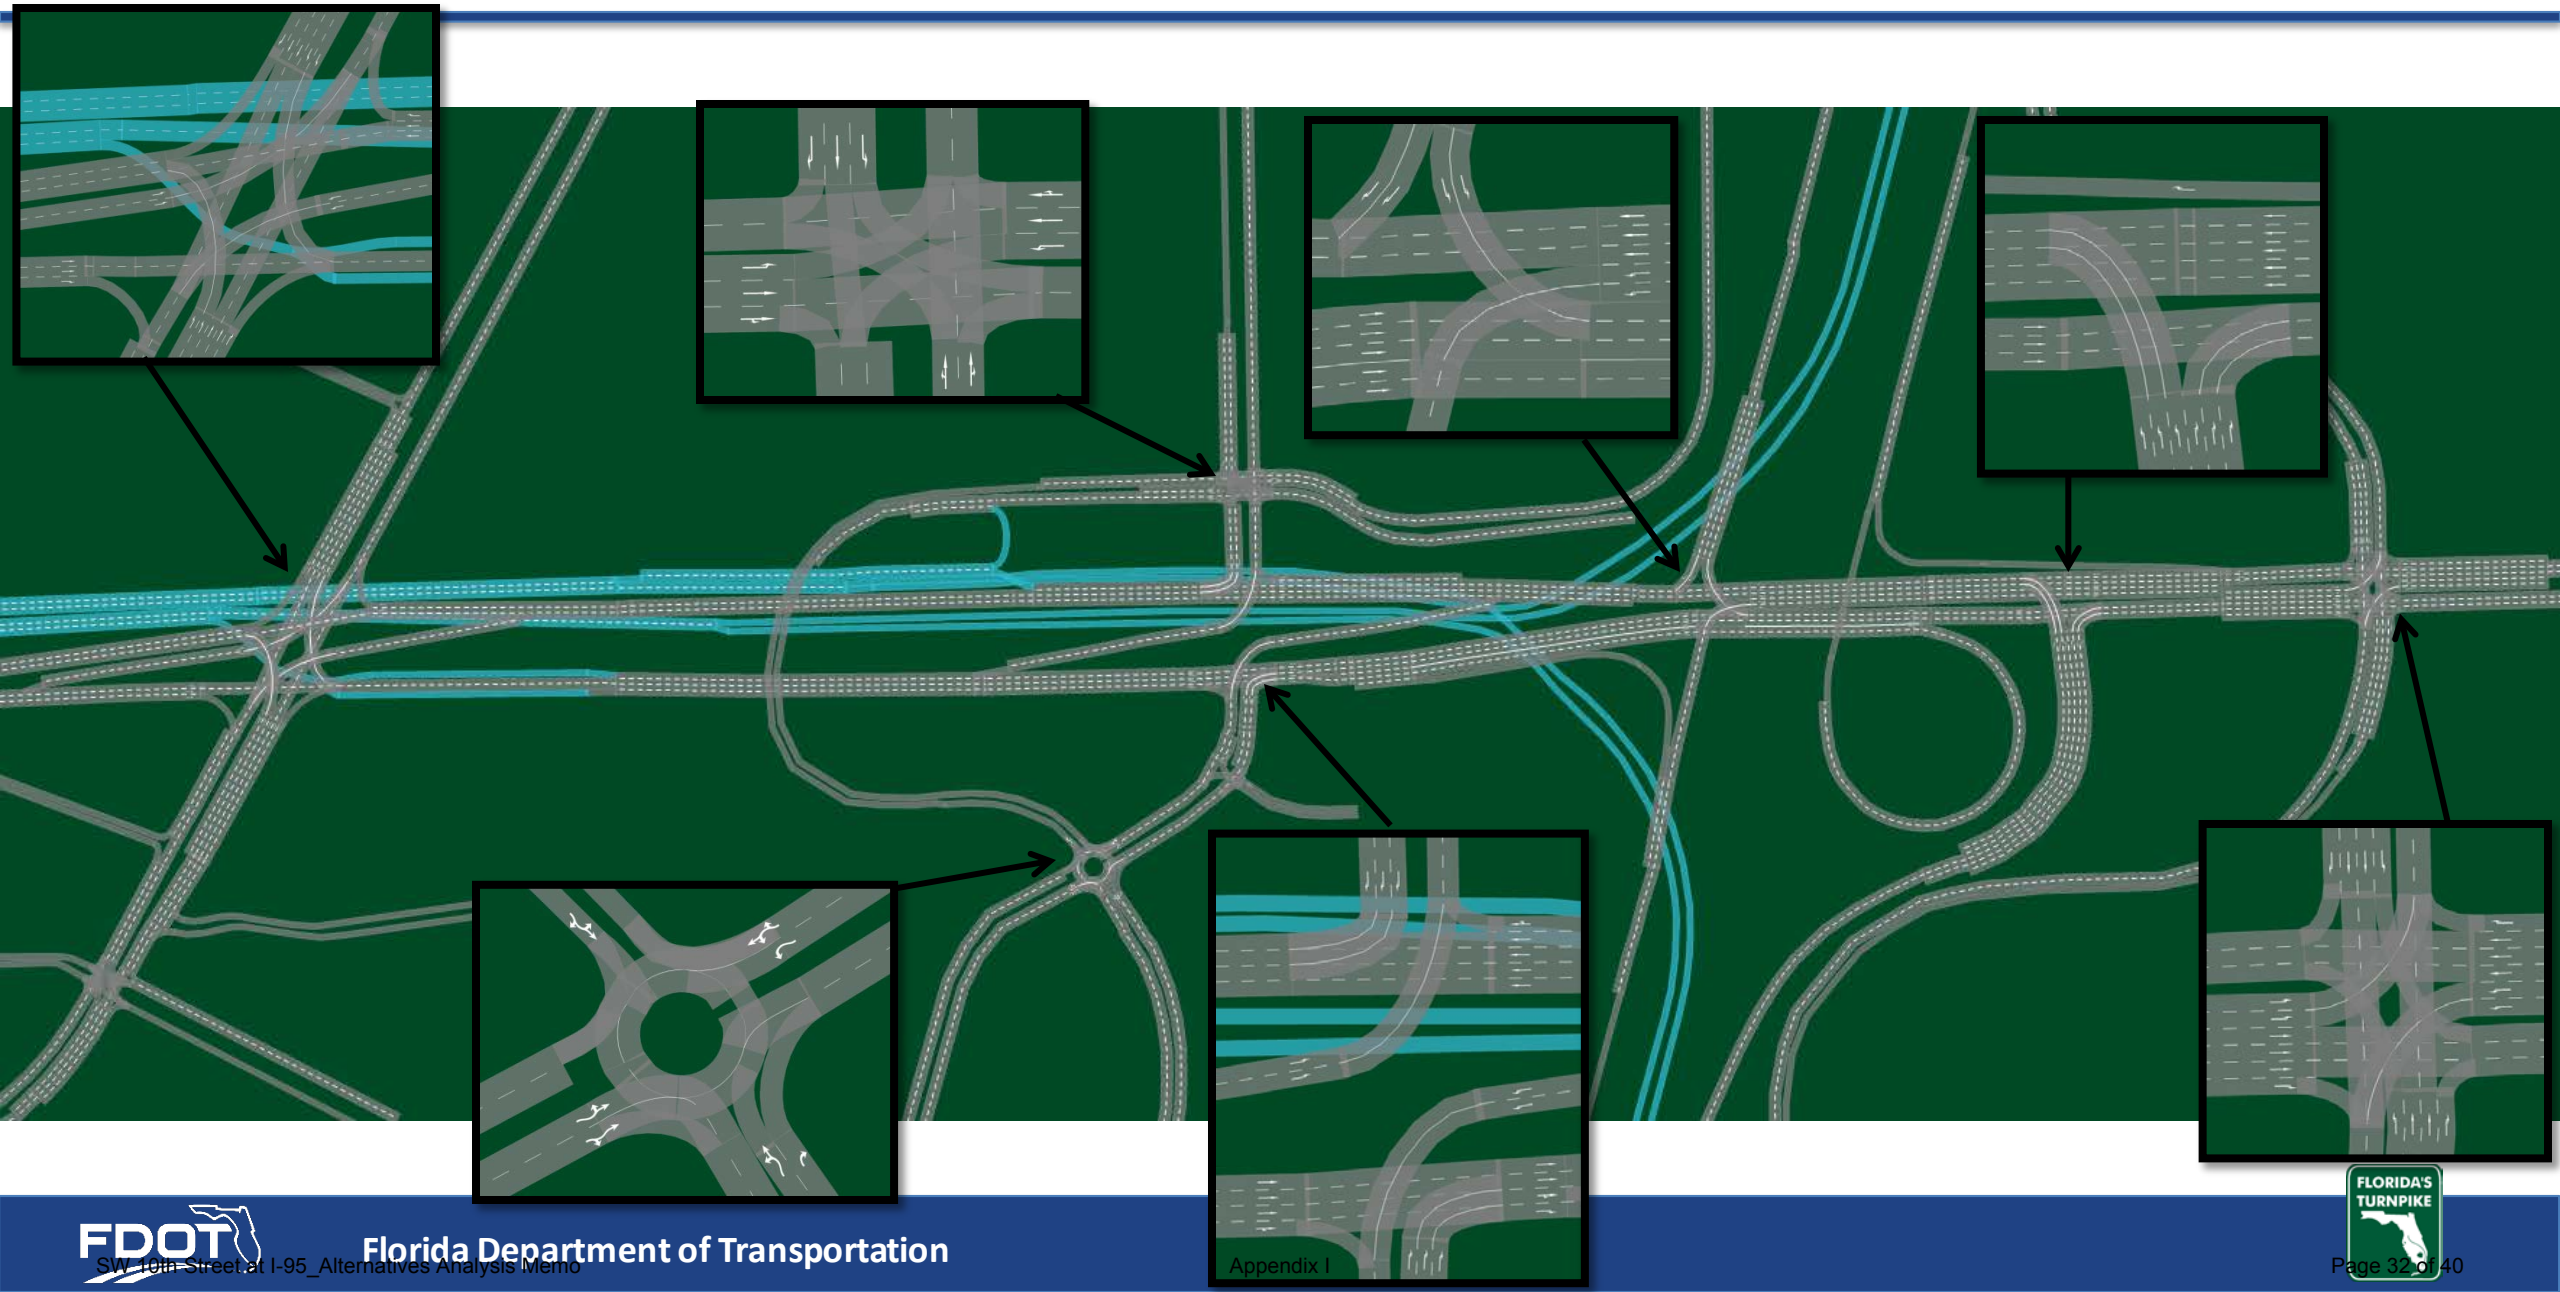
Figure 12: Build Option 3D-1.3 North Modified Both Side Merge With Roundabout



North Build Alternative 3D-1.3 Modified – Comparison of Weaving Volumes and Minimum Number of Lane Changes for the Eastbound Express Lane Egress Merge Conditions

In addition to the VISSIM analysis discussed above, the eastbound egress merge conditions were also evaluated for weaving volumes and the number of lane changes that would occur due to the different egress merge conditions in the eastbound direction. The origin and destination volumes for both the General Purpose (GP) lane and Express Lane (EL) were determined. Based on the location of the EL egress, the weaving volumes between the GP lane and the EL traffic were estimated. In addition, the number of lane changes that the vehicles from both the GP lane and the EL will have to make in order to reach their destinations was estimated. **Table 8** provides a comparison of the weaving volumes and minimum number of lane changes for the different express egress merge conditions. As shown in green highlighting, both sides egress merge would provide the best operating conditions. With both sides egress merge, the express lane traffic can reach their destinations without any weaving and lane changes, and the GP lane traffic would experience the least weaving and the least number of vehicles having to make lane changes to reach their destinations. **Figures 13** through **15** show the origin and destination traffic from both the GP and the Express lanes for the inside merge, outside merge, and both sides merge conditions, respectively.

Table 8: North Build Alternative 3D-1.3 Modified - Express Lane Alignment
Weaving Volumes and Minimum Lane Changes Comparison: Inside Egress Merge vs. Outside Egress Merge vs. Both Side Egress Merge

Concepts	AM Peak Hour				PM Peak Hour			
	From GP Lane		From Express Lane		From GP Lane		From Express Lane	
	Weaving %	Minimum Lane Changes (vph)	Weaving %	Minimum Lane Changes (vph)	Weaving %	Minimum Lane Changes (vph)	Weaving %	Minimum Lane Changes (vph)
Inside Egress Merge	26%	356	54%	2,052	26%	300	61%	2,093
Outside Egress Merge	73%	1,269	38%	870	77%	1,167	41%	611
Both Sides Egress Merge	20%	267	0%	0	4%	48	0%	0

North Build Alternative 3D-1.3 Modified – User Benefit Calculation for the Eastbound Express Lane Egress Merge Conditions

A user benefit calculation was conducted for the different express egress merge conditions for design year 2040. Cumulative benefits for the three merge conditions in 2018 dollars were determined based on the benefits for each year from opening year 2020 to design year 2040. **Table 9** summarizes the user benefits in dollars between the three merge conditions.

Table 9: North Build Alternative 3D-1.3 Modified - Express Lane Alignment
User Benefit in Dollars

Present Day Benefit in Dollars (2018)	Outside Egress Merge Minus Inside Egress Merge	Both Sides Egress Merge Minus Inside Egress Merge	Both Sides Egress Merge Minus Outside Egress Merge
Cumulative Benefit Difference	$1,513,100	$6,441,200	$4,927,500

The maximum benefit will be realized by both sides egress followed by outside egress and then inside egress. When compared with the inside egress, the outside egress provides approximately $1.5 million in additional cumulative benefits. The both sides egress provides approximately $6.4 million and $4.9 million in additional benefits compared to the inside egress and outside egress, respectively. It can therefore be concluded from Table 9 that for as long as the cost of adding the inside merge to the outside merge remains within $4.9 million, the benefits will outweigh the cost, otherwise it will be better to maintain the outside only option.

CONCLUSION

As documented in the *Traffic Analysis Technical Memorandum* dated May 4, 2018 and prepared by RS&H, Tier 1 and Tier 2 analyses resulted in the selection of the North Build Alternative 3D-1.3 and the Center Build Alternative 3D-1.3 as the two most suitable alternatives. VISSIM micro simulation resulted in the selection of the North Build Alternative 3D-1.3 as the operationally best Build Alternative. This alternative was further refined to eliminate the northbound and southbound through and left-turn movements from the SW 10th Street and Newport Center Drive intersection and convert the unsignalized intersection of SW 12th Avenue and Newport Center Drive into a roundabout. Additionally, three different express lane egress merge conditions were evaluated for weaving volumes, number of lane changes, and vehicle hours of delay. A combination of both the inside and outside express lane egress merge condition was found to provide the best operating conditions. The both sides egress merge condition also provided the maximum cumulative benefit when compared to the inside only and the outside only merge conditions.

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	1268 lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	1703 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	1496 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	3199 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	789

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	5924 veh/h	Weaving intensity factor, W	0.285
Weaving segment capacity, c_w	8772 veh/h	Weaving segment speed, S	54.5 mph
Weaving segment v/c ratio	0.675	Average weaving speed, S_W	57.8 mph
Weaving segment density, D	27.6 pc/mi/ln	Average non-weaving speed, S_{NW}	53.7 mph
Level of Service, LOS	C	Maximum weaving length, L_{MAX}	4650 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

VR	0.316								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	2174 lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	2609 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	1488 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	4097 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	783

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6784 veh/h	Weaving intensity factor, W	0.347
Weaving segment capacity, c_w	7478 veh/h	Weaving segment speed, S	48.8 mph
Weaving segment v/c ratio	0.907	Average weaving speed, S_W	55.8 mph
Weaving segment density, D	35.2 pc/mi/ln	Average non-weaving speed, S_{NW}	46.1 mph
Level of Service, LOS	E	Maximum weaving length, L_{MAX}	5759 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Analysis Time Period	AM

Site Information

Freeway/Dir of Travel	I-95 SB
Weaving Segment Location	Seg 14- Bet Sample & Copans
Analysis Year	2020 Build 1

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	One-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	2520ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	3575	0.95	3	0	1.5	1.2	0.985	1.00	3820
V_{RF}	1790	0.92	2	0	1.5	1.2	0.990	1.00	1965
V_{FR}	605	0.92	2	0	1.5	1.2	0.990	1.00	664
V_{RR}	0	0.95	0	0	1.5	1.2	1.000	1.00	0
V_{NW}	3820							V =	6449
V_W	2629								
VR	0.408								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	792

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6367 veh/h	Weaving intensity factor, W	
Weaving segment capacity, c_w	5800 veh/h	Weaving segment speed, S	mph
Weaving segment v/c ratio	1.098	Average weaving speed, S_W	mph
Weaving segment density, D	pc/mi/ln	Average non-weaving speed, S_{NW}	mph
Level of Service, LOS	F	Maximum weaving length, L_{MAX}	6767 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = using Equation (Exhibit 13-6)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

M_S = (Exibit 13-11)

S_R= mph (Exhibit 13-11)

S_0= mph (Exhibit 13-11)

S = mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.436 using Equation (Exhibit 13-7)

V_{12} = 3534 pc/h

V_3 or V_{av34} 1775 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☑ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F	7084	Exhibit 13-8	9600	No
$V_{FO} = V_F - V_R$	6294	Exhibit 13-8	9600	No

$V_{12} = V_F (P_{FM})$

L_{EQ} = 2226.25 (Equation 13-6 or 13-7)

P_{FM} = 0.611 using Equation (Exhibit 13-6)

V_{12} = 3114 pc/h

V_3 or V_{av34} 1982 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☑ Yes ☐ No

If Yes,V_{12a} = 3114 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}	6918	Exhibit 13-8		No

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}	4936	Exhibit 13-8	4600:All	Yes

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = 35.6 (pc/mi/ln)

LOS = E (Exhibit 13-2)

Speed Determination

M_S = 0.744 (Exibit 13-11)

S_R= 49.2 mph (Exhibit 13-11)

S_0= 64.7 mph (Exhibit 13-11)

S = 52.8 mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = using Equation (Exhibit 13-7)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F		Exhibit 13-8		
$V_{FO} = V_F - V_R$		Exhibit 13-8		
V_R		Exhibit 13-10		

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086\ V_{12} - 0.009\ L_D$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

D_s = (Exhibit 13-12)

S_R= mph (Exhibit 13-12)

S_0= mph (Exhibit 13-12)

S = mph (Exhibit 13-13)

V_W	285								
VR	0.038								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	0 lc	Minimum weaving lane changes, LC_{MIN}	855 lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	1481 lc/h
Minimum RF lane changes, LC_{RF}	0 lc/pc	Non-weaving lane changes, LC_{NW}	3293 lc/h
Minimum FR lane changes, LC_{FR}	0 lc/pc	Total lane changes, LC_{ALL}	4774 lc/h
Minimum RR lane changes, LC_{RR}	3 lc/pc	Non-weaving vehicle index, I_{NW}	2316

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	7381 veh/h	Weaving intensity factor, W	0.233
Weaving segment capacity, c_w	9013 veh/h	Weaving segment speed, S	55.0 mph
Weaving segment v/c ratio	0.819	Average weaving speed, S_W	59.6 mph
Weaving segment density, D	34.0 pc/mi/ln	Average non-weaving speed, S_{NW}	54.9 mph
Level of Service, LOS	D	Maximum weaving length, L_{MAX}	6081 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

FREEWAY WEAVING WORKSHEET

General Information

Analyst	
Agency/Company	AECOM
Date Performed	
Analysis Time Period	AM

Site Information

Freeway/Dir of Travel	I95/SB
Weaving Segment Location	Seg 2-Bet On from Exp & Off
Analysis Year	2040 Build 1

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	Two-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	5200ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	3585	0.95	3	0	1.5	1.2	0.985	1.00	3830
V_{RF}	1265	0.92	2	0	1.5	1.2	0.990	1.00	1389
V_{FR}	1285	0.92	2	0	1.5	1.2	0.990	1.00	1411
V_{RR}	145	0.92	2	0	1.5	1.2	0.990	1.00	159
V_{NW}	6630							V =	6789
V_W	159								
VR	0.023								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	0 lc	Minimum weaving lane changes, LC_{MIN}	477 lc/h
Interchange density, ID	0.7 int/mi	Weaving lane changes, LC_W	1145 lc/h
Minimum RF lane changes, LC_{RF}	0 lc/pc	Non-weaving lane changes, LC_{NW}	3167 lc/h
Minimum FR lane changes, LC_{FR}	0 lc/pc	Total lane changes, LC_{ALL}	4312 lc/h
Minimum RR lane changes, LC_{RR}	3 lc/pc	Non-weaving vehicle index, I_{NW}	2413

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6704 veh/h	Weaving intensity factor, W	0.195
Weaving segment capacity, c_w	9233 veh/h	Weaving segment speed, S	58.5 mph
Weaving segment v/c ratio	0.726	Average weaving speed, S_W	61.0 mph
Weaving segment density, D	29.0 pc/mi/ln	Average non-weaving speed, S_{NW}	58.4 mph
Level of Service, LOS	D	Maximum weaving length, L_{MAX}	5944 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

DownStream								

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = using Equation (Exhibit 13-6)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

M_S = (Exibit 13-11)

S_R= mph (Exhibit 13-11)

S_0= mph (Exhibit 13-11)

S = mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.436 using Equation (Exhibit 13-7)

V_{12} = 3672 pc/h

V_3 or V_{av34} 1700 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☑ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F	7073	Exhibit 13-8	9600	No
$V_{FO} = V_F - V_R$	6030	Exhibit 13-8	9600	No
V_R	1043	Exhibit 13-10	2100	No

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}	3672	Exhibit 13-8	4400:All	No

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086\ V_{12} - 0.009\ L_D$

D_R = 36.3 (pc/mi/ln)

LOS = E (Exhibit 13-2)

Speed Determination

D_s = 0.392 (Exhibit 13-12)

S_R= 59.0 mph (Exhibit 13-12)

S_0= 74.8 mph (Exhibit 13-12)

S = 64.9 mph (Exhibit 13-13)

		Ramp Free-Flow Speed, S_{FR}: 45.0		

Conversion to pc/h Under Base Conditions

(pc/h)	V (Veh/hr)	PHF	Terrain	%Truck	%Rv	f_{HV}	f_p	v = V/PHF x f_{HV} x f_p
Freeway	5470	0.95	Level	3	0	0.985	1.00	5844
Ramp	1500	0.92	Level	2	0	0.990	1.00	1647
UpStream								
DownStream	1720	0.92	Level	2	0	0.990	1.00	1888

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = using Equation (Exhibit 13-6)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

M_S = (Exibit 13-11)

S_R= mph (Exhibit 13-11)

S_0= mph (Exhibit 13-11)

S = mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.538 using Equation (Exhibit 13-7)

V_{12} = 3906 pc/h

V_3 or V_{av34} 1938 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☑ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F	5844	Exhibit 13-8	7200	No
$V_{FO} = V_F - V_R$	4197	Exhibit 13-8	7200	No
