Systems Interchange Modification Report

Determination of Engineering and Operational Acceptability

Acceptance of this document indicates successful completion of the review and the Interchange Access. Request is considered acceptable for engineering and operations. Approval is contingent upon compliance with applicable Federal requirements, specifically the National Environmental Policy Act (NEPA) or Department Project Development and Environment (PD&E) Procedures. Completion of NEPA/PD&E process is considered acceptance of the general project and concepts described in the environmental document.

QUALITY CONTROL CERTIFICATION FOR INTERCHANGE ACCESS REQUEST SUBMITTAL

Submittal Date: September 25, 2019

FM Number: 436964-1-22-02

Project Title: SR 9 (I-95) Systems Interchange Modification Report – Sample Road to Hillsboro Boulevard

District: Four

Requestor: Robert E. Bostian, Jr. P.E. Phone: 954-777-4427

District IRC: Cesar Martinez, P.E. Phone: 954-777-4653

Document Type: ☐ MLOU ☐ IJR ☐ IMR ☐ IOAR ☑ OTHER SIMR

Status of Document (Only complete documents will be submitted for review; however, depending on the complexity of the project, interim reviews may be submitted as agreed upon in the MLOU)

Draft Submittal

Quality Control (QC) Statement

This document has been prepared following FDOT Procedure Topic 525-030-260 (New or Modified Interchanges) and complies with the FHWA's two policy requirements. Appropriate District-level quality control reviews have been conducted, and all comments and issues have been resolved to their satisfaction. A record of all comments and responses provided during QC review is available in the project file or Electronic Review Comments (ERC) system.

Requestor: _____ Date: _____

IRC: _____ Date: _____

Engineer's Certification

I, Pramod Choudhary, PE, PTOE, PE number 61641, certify that I currently hold an active Professional Engineer's License in the State of Florida and I am competent through education or experience to provide engineering services in the civil and traffic engineering disciplines contained in this report. I further certify that this report was prepared by me or under my responsible charge as defined in Chapter 61G15-18.001 F.A.C. and that all statements, conclusions and recommendations made herein are true and correct to the best of my knowledge and ability.

Project Description: SR 9 (I-95) Systems Interchange Modification Report – Sample Road to Hillsboro Boulevard

EXECUTIVE SUMMARY

The primary purpose of the I-95 Systems Interchange Modification Report (SIMR) project is to identify the long-term needs of I-95 interchange at SW 10th Street (SR 869) and the adjacent interchanges at Hillsboro Boulevard (SR 810) and Sample Road (SR 834) through 2040 and to develop design concepts to address traffic spillbacks onto I-95, improve interchange operations, reduce congestion, and enhance safety. This SIMR evaluates the traffic operations of the No-Build, Build 1, Build 2 and Build 3 alternatives.

The information and analysis indicate that several of the merge, diverge and weaving areas have been designated as High Crash Locations at some point within the last three years of analysis (2013-2015). Similarly, the No-Build Alternative is projected to experience operational failures at multiple merge, diverge and weave locations along I-95 within the study interchanges. It is important to note that all three Build alternatives have similar interchange modifications and differ only in their forecast traffic volumes depending on the direct-connect ramps between I-95 Express Lanes and SW 10th Street connector lanes. Build 1 has no direct-connect ramps, Build 2 has direct-connect ramps terminating west of Military Trail, and Build 3 has direct-connect ramps connecting to Sawgrass Expressway (Please refer to Conceptual Plans in Appendix J). The following modifications have been made to the SW 10th Street interchange configuration:

- Southbound Ramp Terminal at SW 10th Street:
  - The traffic signal for the westbound left-turn from SW 10th Street traffic to southbound I-95 has been eliminated and combined with the I-95 southbound off-ramp signal.
  - The existing single westbound left turn lane has been converted into dual westbound left-turn lanes and the storage has been extended approximately 250 feet east of the northbound off-ramp signal.
  - A barrier separation has been provided between the eastbound through lanes and the eastbound to northbound right turn movement to eliminate weaving and allow for concurrent movement of the southbound left turn and eastbound right turn movement. The single lane eastbound to northbound loop ramp has been widened to provide for two lanes.
  - The existing single free-flow southbound right turn lane has been widened to provide for signal controlled dual right-turn lanes to improve operations and safety in the westbound direction. The free-flow right turn movements are always a safety concern for the pedestrians in the cross-walk. Also, due to the proximity of the signalized intersection at Newport Center Drive, the free-flow right turn induces weaving with the westbound traffic. This condition is likely to become worse with the introduction of the access to the westbound connector lanes immediately west of the Newport Center Drive.

- Northbound Ramp Terminal at SW 10th Street:
  - The westbound to northbound left-turn movement has been converted to a free-flow westbound to northbound right turn movement. This eliminates the westbound left turn phase and provides more green time to the eastbound movement.
  - The northbound off-ramp has been widened to provide for triple left turn and triple right turn lanes.
  - The eastbound to northbound loop ramp and the westbound to northbound slip ramp will merge together before merging with the I-95 mainline traffic.

Proposed modifications to the interchange are recommended to address projected deficiencies in the future. Listed below are specific modifications and projected benefits:

- The proposed Build 1, 2 and 3 alternatives with a 7,900 foot SB auxiliary lane on I-95 between the SB entrance ramp from SW 10th Street and the SB exit ramp to Sample Road creates a 4-lane mainline segment on SB I-95 and is projected to significantly improve the operations in the SB direction.
- The proposed NB braided ramps at the SW 10th Street interchange and the SB braided ramps at Hillsboro Boulevard not only reduce the number of merge and diverge points along I-95 but also provides for longer off-ramp storage lengths. Freeway analysis projects significant improvements over the No-Build conditions in the merge, diverge and mainline operations in both directions.
- As discussed above, the SW 10th Street interchange ramp terminal improvements proposed under the Build 1, 2 and 3 alternatives are projected to significantly improve the operations at the ramp terminals and potentially eliminate the possibility of off-ramp queues spilling on to the mainline.
- The proposed elimination of the SB on-ramp signal at SW 10th Street and the proposed improvements along SW 10th Street are expected to significantly improve the flow of traffic along the arterial, particularly at the interchange. The improved operations are projected to improve the safety along the corridor.
- The intersection of SW 10th Street and Newport Center Drive is located less than 900 feet west of the SB off-ramp terminal and the westbound queues affect the ramp operations. In order to provide more green time for the east-west movements at this intersection, the northbound and southbound approaches have been modified to allow only right turn movements. Triple right turn lanes have been provided on the northbound and southbound approaches. The northbound and southbound through and left turn movements have been reassigned based on their destination to SW 12th Avenue/Newport Center Drive local road.

These improvements address the traffic operation deficiencies by eliminating or improving the failing conditions within the interchange influence area and improving safety by reducing congestion and improving operating conditions along SW 10th Street and Hillsboro Boulevard. A traditional crash reduction analysis shows that the proposed improvements are likely to reduce approximately 43 crashes per year resulting in an annual safety benefit of more than six (6) million dollars.

Considering the overall operations along I-95, ramp terminals and along Hillsboro Boulevard and SW 10th Street, all three Build alternatives are projected to provide better operating conditions than the No-Build. However, the operational improvements under the Build 3 alternative are better than Build 1 and Build 2 despite the highest traffic demand under Build 3. In terms of Strategic Intermodal System (SIS) connectivity, Build 3 provides better connectivity. Build 3 provides a direct and logical system-to-system connection between Sawgrass Expressway and I-95 and Florida's Turnpike. VISSIM analysis of the No-Build and Build 3 alternatives confirms that the Build 3 alternative is expected to provide better operations than the No-Build alternative in 2040.

The Federal Highway Administration's (FHWA's) newly adopted policy on *Access to the Interstate System* became effective on May 22, 2017 and replaces the policy of August 27, 2009 on *Access to the Interstate System*, published at 74 Federal Register 43743. The changes in this policy are made to ensure this policy focuses on safety, operational, and engineering issues. The consideration of social, economic, and environmental impacts discussed in the 2009 policy are removed from this policy. However, the removal from this policy does not eliminate the need to consider those matters. Those issues will be addressed under the National Environmental Policy Act and other statutes and regulations applicable to the approval process.

This policy is effective as of May 22, 2017.

It is in the national interest to preserve and enhance the Interstate System to meet the needs of the 21st Century by assuring that it provides the highest level of service in terms of safety and mobility. Full control of access along the Interstate mainline and ramps, along with control of access on the crossroad at interchanges, is critical to providing such service. Therefore, the Federal Highway Administration's (FHWA) decision to approve new or revised access points to the Interstate System under Title 23, United States Code (U.S.C.), Section 111, must be supported by substantiated information justifying and documenting that decision. The FHWA's decision to approve a request is dependent on the proposal satisfying and documenting the following requirements:

Considerations and Requirements

1. *An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate*

facility (which includes mainline lanes, existing, new, or modified ramps, and ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (Title 23, Code of Federal Regulations (CFR), paragraphs 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

The operational analysis conducted for the SIMR confirmed that the proposed interchange modifications are not expected to have any significant adverse impacts on safety and operations on the interstate facility (I-95). The proposed improvements along Hillsboro Boulevard and SW 10th Street under the Build alternatives are expected to significantly improve the operations at the NB and SB off-ramp terminal intersections. The 2040 No-Build queuing results for the NB off-ramp at SW 10th Street show the queues to be approaching the available storage lengths which could adversely impact the flow of traffic along I-95. The proposed improvements under the 2040 Build conditions are projected to significantly increase the available storage length for this ramp and should prevent the queue from adversely affecting the operations along I-95. The projected failing conditions under the No-Build Alternative are expected to increase future crash risk within the project corridor. This potential for increased crash risk is alleviated by the capacity improvements proposed in the Build Alternatives.

Many of the improvements proposed for this project are unconventional and unique. The limitations in the Highway Safety Manual (HSM) analysis methodology fail to capture the benefits of the proposed operational and capacity improvements proposed under the Build alternatives and consequently fail to quantify the crash reduction in a meaningful way for this project. Therefore, a traditional crash reduction analysis was conducted to estimate the potential safety benefits of the proposed freeway, interchange, and arterial improvements. The analysis shows that the proposed improvements are likely to reduce approximately 43 crashes per year resulting in an annual safety benefit of more than six (6) million dollars.

2. *The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit or high occupancy vehicle and high occupancy toll lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.*

This SIMR does not propose any new interchanges along I-95. These existing interchanges provide access to public roads only. The improvements proposed at the interchanges will maintain full access to the existing cross streets and accommodate all movements.

1 PROJECT OVERVIEW

1.1 Introduction

At the request of the Department and as part of Financial Project ID 436964-1, a traffic analysis was undertaken to identify the long-term needs of the project area through 2040 and to develop design concepts to address traffic spillbacks onto I-95, improve interchange operations, reduce congestion, and enhance safety at the study interchange of I-95 at SW 10th Street (SR 869) and adjacent interchanges at Hillsboro Boulevard (SR 810) and Sample Road (SR 834). The study area is located within the City of Deerfield Beach in northeast Broward County, Florida. The project area includes I-95 (SR 9) from south of Sample Road (SR 834) (MP 21.601) to north of Hillsboro Boulevard (SR 810) (MP 24.641). **Figure 1.1** provides a Project Location Map. This System Interchange Modification Report (SIMR) provides the justification documentation for the proposed interchange access modifications to the SW 10th Street and Hillsboro Boulevard interchanges along I-95.

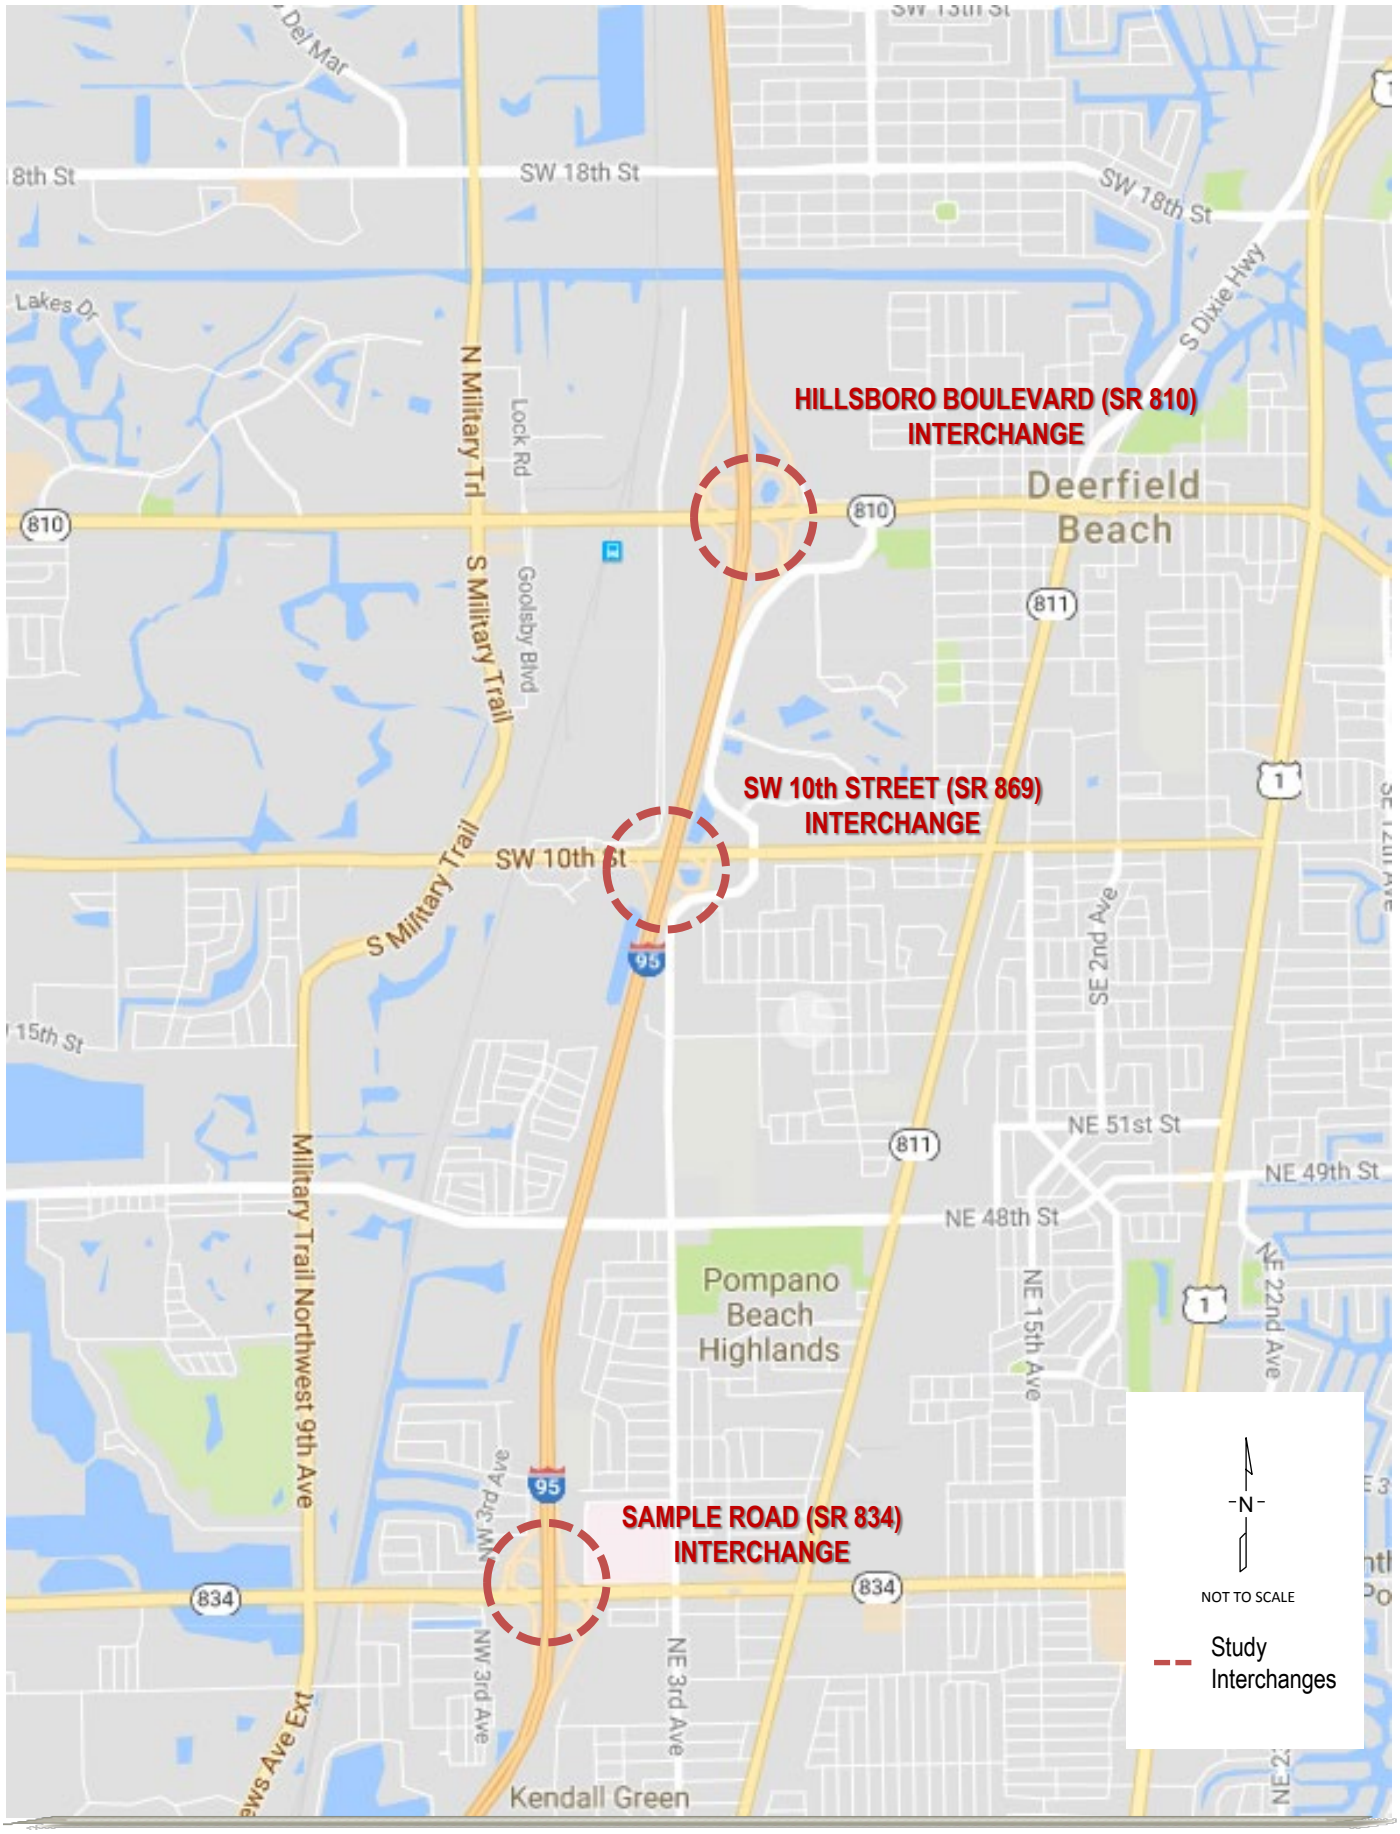
1.2 Purpose and Need for Project

The purpose of this project is to eliminate various existing operational and safety deficiencies along I-95 between and including the interchanges at SW 10th Street and Hillsboro Boulevard, and also on SW 10th Street and Hillsboro Boulevard in the vicinity of I-95. The primary need for the project is based on capacity/operational and safety issues, with secondary considerations for the needs of evacuation and emergency services, transportation demand, system linkage, modal interrelationships, and social demands and economic development.

1.3 Planned and Programmed Transportation Projects

Applicable Master Plans, SIS Plans, FDOT's Five (5) Year Work Program, interchange planning and safety studies performed by FDOT District Four and future projects identified in the Palm Beach MPO TIP, Palm Beach MPO 2040 Long Range Transportation Plan (LRTP), local government comprehensive plans, and active Development of Regional Impact (DRI) applications were reviewed to identify any planned and programmed improvements within the study limits of the SIMR. Additionally, the I-95 Express Lanes Phase 3 Design was also reviewed to identify planned and programmed improvements within the SIMR limits. The SIMR improvements will be developed consistent with these plans or steps will be taken to achieve consistency.

Figure 1.1: Project Location Map



1.3.1 FDOT Plans and Projects

The I-95 Express Phase 3B-2 project from Stirling Road to Linton Boulevard is currently under preliminary design and will be let in FY 2019 as a Design-Build project. This project will introduce 2 tolled, express lanes in place of the existing High Occupancy Vehicle lane. The I-95 Corridor Design Consultant (CDC) is analyzing this project to ensure its compatibility with the I-95 SIMR.

In addition, there is an ongoing SW 10th Street Connector PD&E Study (FPID 439891-1) which is studying the feasibility of connecting the existing Sawgrass Expressway from Florida's Turnpike to I-95 through managed lanes. Every effort has been taken to maintain consistency between this SIMR and the ongoing PD&E Study.

The following FDOT planned projects have been identified within the SIMR study limits:

I-95 Interchange Improvements from Hillsboro Boulevard to SW 10th Street

Financial Number: 430932-1-52-01
Project Length: 1.5 miles
Project Limits: I-95 from the Hillsboro Boulevard entrance ramp to SW 10th Street
Start Date: January 5, 2015
Completed: Spring 2018
Contractor: Community Asphalt Corp.
Estimated Construction Cost: $4.5 million
Scope of Work:

This is 1 of 5 interchange improvements throughout Broward and Palm Beach Counties. Work at this location included the following:

- Added SB auxiliary lane on I-95 from eastbound Hillsboro Boulevard to I-95 southbound entrance ramp to the SW 10th Street exit ramp.
- Widened the SB I-95 exit-ramp to provide a two-lane exit from I-95 with free-flow southbound right turn and two exclusive southbound left turn lanes at the SW 10th Street SB off-ramp terminal.
- The free-flow southbound right turn lane was extended to the Newport Center Drive intersection as an exclusive westbound right turn lane.
- Utility relocation, milling and resurfacing of existing pavement, bridge widening, and installation of barrier walls, curbs, sidewalks, guardrail, drainage, overhead signs, signing and pavement marking, signals, lighting and retaining walls.

Hillsboro Boulevard Improvements Project in Deerfield Beach

Financial Number: 430602-1-52-01
Project Length: 2.32 miles
Project Limits: Hillsboro Boulevard from Military Trail to US 1 in Deerfield Beach
Start Date: January 3, 2017
Completion Date: Early 2018
Contractor: General Asphalt Co.
Estimated Construction Cost: $9.4 million
Scope of Work:

The improvements under this project consisted of the following:

- Improved the off-ramp from NB I-95 to EB Hillsboro Boulevard including the addition of a new signalized intersection and second lane to increase capacity.
- Relocated and upgraded drainage structures, upgraded crosswalk ramps to meet ADA requirements, constructed new stamped asphalt crosswalks from east of Natura Boulevard to US 1.
- Upgraded existing pedestrian signals to countdown timers, upgraded signalized intersections to mast arms, and installed new decorative lighting.
- Constructed new medians east of SE 2nd Avenue, removed old asphalt and resurfaced the roadway, upgraded signs and pavement markings to reflect the new roadway configuration as follows: (1) Military Trail to Dixie Highway - three 11-foot lanes in each direction (2) NE / SE 2nd Avenue to US 1 - two 11-foot lanes in each direction with a bike lane or sharrows in each direction as follows: (i) Military Trail to NW/SW 2nd Terrace - 4-foot bike lane (ii) NW / SW 2nd Terrace to NE / SE 2nd Avenue - Sharrow symbols to designate that the outside travel lane will be shared with vehicles (iii) NE / SE 2nd Avenue to US 1 - 7-foot bike lane.

Sample Road Interchange Ramp Improvements:

Financial Number: 436958-1-52-01
Project Length: 1.12 miles
Project Limits: I-95/SR-9 @ Sample Road Interchange

The improvements under this project consisted of the following:

- Combine the WB to SB loop on-ramp from Sample Road with the EB to SB slip on-ramp from Sample Road to create a single on-ramp merge on the mainline.
- Combine the EB to NB loop on-ramp from Sample Road with the WB to NB slip on-ramp from Sample Road to create a single on-ramp merge on the mainline.

1.4 Requestor Information

This I-95 Systems Interchange Modification Report (SIMR) has been prepared for the Florida Department of Transportation, District Four. For information on the SIMR, please contact the Department's Project Manager at the following address:

Robert E. Bostian, Jr., PE, Project Manager FDOT- District 4

3400 West Commercial Boulevard Fort Lauderdale, FL 33309-3421

Phone: (954) 777-4427

E-mail: Robert.Bostian@dot.state.fl.us

2 METHODOLOGY

The methodology applied for the I-95 SIMR is documented in the Methodology Letter of Understanding (MLOU), dated May 2017. The MLOU was approved by FDOT District 4 and FDOT Central Office Systems Planning. The MLOU outlines the criteria, assumptions, processes, analyses and documentation requirements for the project. The approved MLOU is included in **Appendix A** for ease of reference. The following summarizes some of the more prominent issues covered under the MLOU.

2.1 Area of Influence

2.1.1 I-95 Mainline

The Area of Influence (AOI) along I-95 (SR 9) will include the freeway merge/diverge ramps at the adjacent interchanges to the south and north of SW 10th Street including ingress/egress ramps to/from I-95 Express lanes. For existing conditions, the adjacent interchange south of SW 10th Street is Sample Road (SR 834) and the adjacent interchange north of SW 10th Street is Hillsboro Boulevard (SR 810). **Figure 2.1** provides a graphical representation of the AOI.

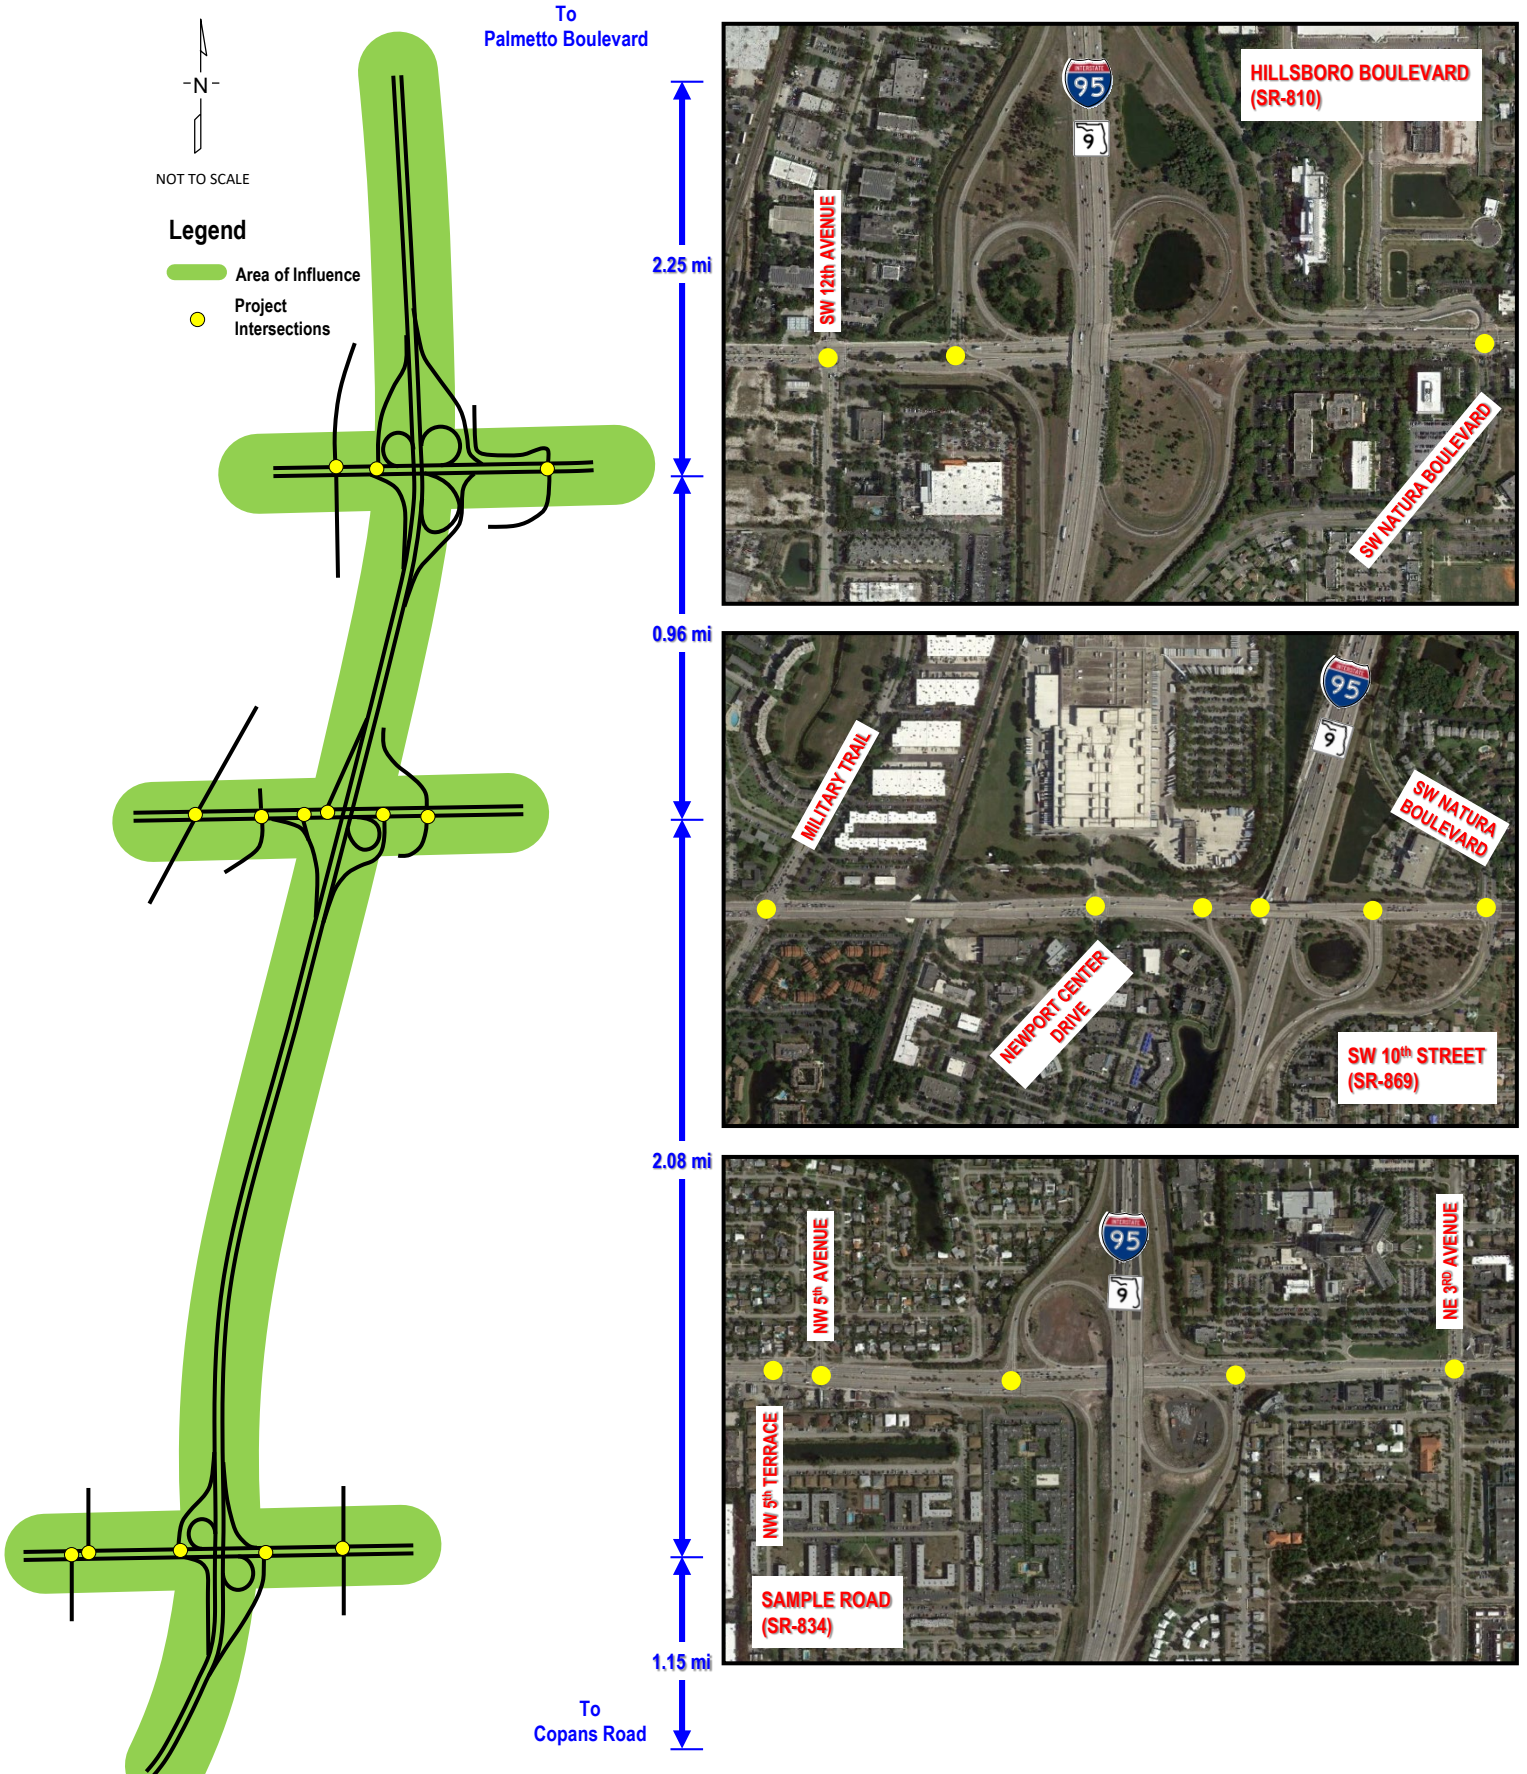
2.1.2 Along Crossroads

The AOI will include the intersections identified in **Table 2.1** below.

Table 2.1: Proposed Study Intersections

Interchange	List of Intersections
Sample Road (SR 834)	• I-95 NB off ramp at Sample Road • I-95 SB off ramp at Sample Road • Sample Road at 5th Terrace/5th Ave • Sample Road at NE 3rd Avenue
SW 10th Street (SR 869)	• I-95 NB off ramp at SW 10th Street • I-95 SB off ramp at SW 10th Street • SW 10th Street at S. Military Trail • SW 10th Street at Newport Center Drive • SW 10th Street at Natura Boulevard
Hillsboro Boulevard (SR 810)	• I-95 NB off ramp at Hillsboro Boulevard • I-95 SB off ramp at Hillsboro Boulevard • Hillsboro Boulevard at SW 12th Avenue • Hillsboro Boulevard at Natura Boulevard/Fairway Drive

Figure 2.1: Area of Influence



2.2 Analysis Years

The analysis years for the project were determined as follows:

For Traffic Forecasting:

- Base year 2010
- Horizon year 2040

For Traffic Operational Analysis:

- Existing year 2016
- Opening year 2020
- Design year 2040

2.3 Travel Demand Forecasting

2.3.1 Selected Travel Model

The modeling effort was coordinated between FDOT District 4 and Florida's Turnpike to produce a consistent traffic forecasts for various traffic studies on major corridors - I-95, SW 10th Express Lanes Street, Sawgrass Expressway Widening, and Florida's Turnpike Widening. The travel demand forecasts for the SW 10th Street SIMR were prepared by Florida's Turnpike in conjunction with the SW 10th Street PD&E and Sawgrass Widening PD&E studies. At the beginning of the forecast effort in late-2016, the Florida's Turnpike developed the project-level SERPM 6.54 FTE for use in this study. The SERPM 6.54 FTE included network and socioeconomic data updates consistent with SERPM 7. District 4 approved the use of the SERPM 6.54 model at the onset of the project since the effort was being conducted by the Florida's Turnpike. Additionally, District 4 conducted a reasonability test comparing SERPM 7 with SERPM 6.54 in anticipation of future questions. As documented in the SW 10th Street Subarea Model validation dated December 2017, the comparative analysis found the models to be relatively similar indicating reliability of forecasted volume along the corridor.

The project traffic forecasts for this study were developed through a multi-step process. With the need to estimate dynamically tolled express lane traffic for the Build scenarios, the methodology used two modeling tools:

- SERPM Travel demand model
- Express Lanes Time-of-Day Model

Forecasted AADT and EL hourly traffic were derived from these two models. This information was used to derive future year directional design hour traffic (DDHV). Model-generated origin-destination trip matrices also provided inputs to operational simulation models for the No-Build and Build scenarios.

As mentioned above, the study used the FTE version of the Southeast Regional Planning Model (SERPM-FTE) 6.5.4, which has been used for various studies, including the I-95 Express Lanes Traffic and Revenue study and the Sawgrass Expressway Widening PD&E study. The SERPM covers a three-county region in Southeast Florida: Palm Beach, Broward, and Miami-Dade. SERPM-FTE includes model network enhancements such as the recoding of interchange configurations along the major freeway networks in Southeast Florida and updates to the future land use data to reflect the best known information at the time. The SERPM produces travel demand forecasts at a daily level and by three time periods: AM Peak (6:30 AM – 9:30 AM), PM Peak (3:30 PM – 6:30 PM), and off-peak (remainder of the day).

The Express Lane Time of day (ELToD) model works in conjunction with the SERPM and is designed to take daily and peak period subarea trip tables and produce traffic estimates by hour, by direction, for both the general purpose lanes (GPLs) and ELs for each roadway segment. The model is considered state-of-the-practice for forecasting travel demand on Express Toll lanes in Florida.

2.3.2 Model Validation Methodology

The model development for this project consisted of enhancing the local subarea by recoding intersection configurations, splitting Traffic Analysis Zones (TAZs), and adding local streets important to local circulation around the study corridor. Within the subarea, the highway network coding was reviewed and corrected as needed using aerial imagery. The SERPM was validated to 2010 traffic conditions in an iterative fashion by first adjusting link speeds at the regional level and using the Cube Analyst process at the subarea level.

A Cube Analyst process was used at the subarea level to adjust the origin-destination matrices to obtain a better correlation between observed counts and model estimates. The Cube Analyst process is a matrix estimator that uses a seed origin-destination matrix along with link level traffic counts to develop an origin-destination matrix in an iterative fashion that corresponds to model-estimated volumes which closely match the provided link counts.

The adjustments to origin-destination tables by the Cube Analyst process were calculated by subtracting the original subarea origin-destination table from the adjusted origin-destination table by time period. This adjustment (also known as validation Delta) was applied to the future year model estimated origin-destination tables.

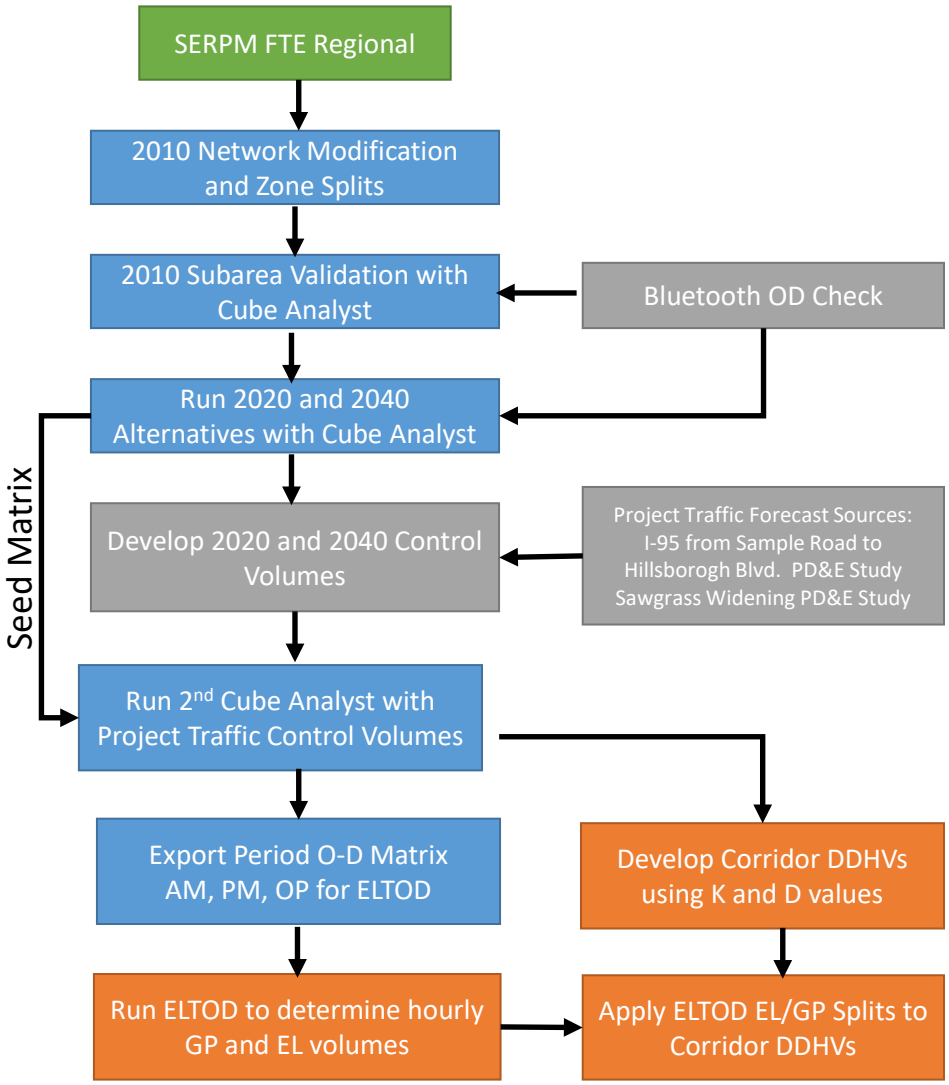
2.3.3 Project Traffic Forecast Development Methodology

The development of the project traffic forecast was a multi-step effort involving a combination of internal modeling procedures and post-model evaluation. **Figure 2.2** illustrates the process beginning with the regional model. After the SERPM-FTE project model was validated against the 2010 traffic conditions, the future year model runs were conducted for the 2020 and 2040

No-Build and Build alternatives. The results of the future year Build scenarios were checked against the Bluetooth Origin-Destination data to see if the traffic between the Turnpike and I-95 Corridors that diverted to the SW 10th Street from the other interchanges was reasonable.

The traffic forecasting methodology used for each approach of each intersection was based on the 2016 AADT (from the field), and 2010 and 2040 SERPM model volumes. The recommended 2040 AADTs were calculated by applying the model growth rate to the 2016 AADT. For all the roadway links, the 2016 and 2040 AADT has been compared, and a minimum compound growth rate of 0.5% has been adopted. Then the 2020 and 2030 volumes were interpolated using 2016 AADT and recommended 2040 volumes.

Figure 2.2: Project Traffic Forecast Development Process



Once the No-Build forecast was determined for 2040, the Build project forecast was determined by applying the model differences to the No-Build project forecast. For example, 2040 Build 2 project traffic forecasts = 2040 No-Build project traffic + (2040 Build 2 Model – 2040 No-Build Model). The Build 3 project traffic was determined by taking the difference between the Build 2 and Build 3 model values and adding this impact layer to the Build 2 project forecast. This process was also used to develop 2020 and 2040 Build 2 and Build 3 forecast volumes along I-95 mainline, all ramps, and arterials.

Once project traffic forecast volumes were established as control values, a second Cube Analyst step was implemented to adjust the initial trip tables to match with the forecast values at selected links in the subarea. The final adjusted trip tables were assigned to the subarea networks for each scenario to produce the 2020 and 2040 forecasts on all links with and without control totals. Finally, the second Cube Analyst assignment results were checked, smoothed, and rounded to produce the project forecast AADTs.

The final forecasted AADTs from the subarea model, along with K-factors and D-factors, were used to develop corridor-level directional design hour volume (DDHV). For express lane locations, the Subarea model peak period trip tables were then exported to ELToD to determine hourly traffic for the general purpose and express toll lanes.

2.3.4 Adjustment Procedures

If the model growth rate was less than the recommended 0.5% growth rate, a 0.5% growth rate was utilized. Otherwise, the growth factor calculated based on the model volumes was used. Then the 2020 and 2030 volumes were interpolated using 2016 AADT and recommended 2040 volumes. For the roadway segments where the 2040 model volumes are lower than the 2010 model volumes, or are not included in the model network, the future 2020, 2030, and 2040 AADTs were calculated using 2016 AADT and a compound growth factor of 0.5%.

The No-Build scenario for the I-95 PD&E study and the SW 10th Street PD&E study is same. Hence, there is a need to achieve a consistent project forecast between the two projects. The forecast approach discussed with FDOT District 4 and Turnpike staff was to determine a project forecast for the No-Build scenario consistent with the I-95 PD&E study and pivot from these forecasts using the impacts identified from the SW 10th Street PD&E model. The methodology outlined in the Traffic Data Collection and Traffic Projections Report for the I-95 PD&E study was to apply a growth rate of 0.5 percent or model growth (whichever is greater) to the 2016 traffic volumes. Since the SW 10th Street Study I-95 study limits extend beyond the I-95 PD&E study limits (from Sample Road to Hillsboro Boulevard), a 0.5 percent growth rate was applied for the interchanges south of Sample Road, and the raw subarea SW 10th model results were used north of Hillsboro.

2.4 Traffic Factors

The directional design hour volumes (DDHV) development process for the I-95 IMR involved the application of the standard procedure of adjusting the average annual daily traffic (AADT) volumes with the Standard K and D30 traffic factors. However, it was adjusted to produce AM and PM peak hour volumes along the different corridors as follows:

- Standard K was applied to the highest peak hour period between AM or PM; the other period K factor was determined as a ratio based on existing counts.
- I-95 mainline Standard K = 7.0% was proposed
- Standard K = 8.0 was applied to I-95 ramps and along the crossing corridors between the I-95 Ramps. Other K factors were based on existing and historical counts. D factors were calculated by link for each peak period based on existing and historical data.
- 24T and DHTf were calculated for each intersection or link based on existing and historical data. A minimum DHTf factor of 2.0% was used.
- PHF for Existing Year Analysis was based on existing counts. PHF for Future Year Analyses: PHF=0.95 for I-95 Mainline; PHF=0.92 for ramp movements and cross streets.
- TMTool, rounding and balancing were conducted; therefore, the final K and D may not match the initial values.

The proposed Traffic factors for this SIMR are summarized on **Table 2.2**

Table 2.2: Existing Traffic Factor Values

Roadway	K%	D%	24T%	DHTf(1)%	PHF(2)
I-95 Mainline	7.0	50.5 to 56.7	4.0 to 6.0	2.0 to 3.0	0.85 to 0.99
I-95 Ramps	8.0	100	4.0 to 6.0	2.0 to 3.0	0.85 to 0.99
SW 10th Street	5.7 to 12.8	50.0 to 83.4	3.0 to 8.0	2.0 to 3.0	0.93 to 0.97
Hillsboro Boulevard	3.6 to 9.0	50.0 to 93.3	3.0 to 9.0	2.0	0.94 to 0.96
Sample Road	3.9 to 9.5	50.7 to 71.2	3.0 to 7.0	2.0 to 3.0	0.92 to 0.96

Source: AECOM preliminary calculations based on existing and historical volume data.

(1) A minimum DHT_f factor of 2.0% will be used.

(2) PHF for Future Year Analyses: PHF=0.95 for I-95 Mainline; PHF=0.92 for ramp movements and cross streets.

2.5 Traffic Operational Analysis

Traffic operational analyses were performed for the Existing Conditions and future No-Build and Build Alternatives. Analyses were performed using the Highway Capacity Software (HCS2010), Version 6.60 and Synchro Version 9. In order to maintain consistency between the three projects viz. SW 10th Street Connector PD&E (439891-1), I-95/SW 10th Street SIMR (436964-1) and Sawgrass Expressway PD&E, within the study area, Synchro 9 was used for all three projects. HCS2010 was used for operational analyses of freeway segments - mainline, ramps, merge,

diverge and weaving segments. Synchro analyses were performed for adjacent signalized intersections and interchange ramp terminal intersections. Synchro software results were reported utilizing the HCM 2000 module outputs. It is important to note that HCM2000 delays can be reported for unconventional intersection designs and signal timings. HCM 2010 fails to provide this information. In order to maintain consistency between the SW 10th Street Connector PD&E Study, I-95/SW 10th Street SIMR and Sawgrass Expressway PD&E Study, HCM 2000 was reported for all intersections.

The HCS and Synchro operations analyses were performed for the following conditions:

- Existing year 2016 conditions, AM and PM peak hours
- Year 2020 conditions for No-Build, Build 1, Build 2, and Build 3 Alternatives, AM and PM peak hours
- Year 2040 conditions for No-Build, Build 1, Build 2, and Build 3 Alternatives, AM and PM peak hours
- Existing year Synchro analysis was conducted using the existing signal timing data
- All future year Synchro analysis for both the No-Build and Build conditions included signal optimization.

2.5.1 Measures of Effectiveness (MOEs)

Analyses of the interchange ramp terminals and adjacent intersections were conducted using Synchro 9 software and results were reported utilizing the HCM 2000 output. Since HCM methodology does not report queues, 95th percentile queues were obtained from Synchro report.

FDOT Topic No. 000-525-006-c provides Level of Service (LOS) Targets for the State Highway System (SHS). The following LOS criteria are considered acceptable for the SIMR. The following LOS criteria were considered for the I-95 IMP analysis since the study area is considered to be an "Urbanized Areas over 500,000".

- SIS Facilities – LOS D
- Other State Roads – LOS D

It should be noted that the traffic operational objectives were to maintain or improve the No-Build operations; therefore, the Build Alternatives may not meet the Department's LOS D target in urbanized areas because of the design constraints.

In addition to the signalized intersection LOS criteria stated above, operational analysis criteria also included the following:

- Delay (seconds per vehicle)
- Maximum volume-to-capacity (v/c) ratio: Where possible, each intersection movement was designed to have a v/c ratio of 1.0 or less.

- Interchange off-ramp queue lengths: The 95th percentile queue was utilized to determine the required storage length for all interchange off-ramp queue lengths. Since HCM methodology does not report queues, 95th percentile queues were obtained from Synchro report. The 95th percentile queue was calculated utilizing Synchro queue results which are reported in feet by lane. In order to obtain the total queue length, Synchro reported queue length was multiplied by the number of turn lanes and the lane utilization factor.

3 EXISTING CONDITIONS

3.1 Existing Road Characteristics

The general characteristics of the roadway facilities located within the project limits are described in the sections below. The data below is based on information gathered from the FDOT's Roadway Characteristics Inventory, Straight Line Diagrams (SLDs), Broward County MPO, Broward County Traffic and Engineering Division and field reviews. The existing roadway and intersection lane configurations are depicted in **Figure 3.1**. The Aerial views of the interchanges are presented in **Figures 3.2 through 3.4**.

3.1.1 SR 9/I-95 from north of Palmetto Park Road to south of Yamato Road (SR 794)

Facility Type: Freeway, Limited Access, SIS Facility
Functional Classification: Urban Principal Arterial - Interstate
Access Management Classification (FDOT): Class 1
Typical Section:

North of Sample Road to North of Hillsboro Boulevard Interchange:

Northbound and Southbound: 3 GP, 1 HOV / BW

South of Sample Road Interchange:

Northbound and Southbound: 1 AUX, 3 GP, 1 HOV / BW

Note: AUX-Auxiliary Lane/GP-General Purpose Lane/HOV-High Occupancy Vehicle Lane/BW-Barrier Wall Median

Posted Speed Limit: 65 mph

3.1.2 Sample Road, SW 10th Street, and Hillsboro Boulevard

Facility Type: Arterial
Functional Classification: Urban Principal Arterial - Other
Access Management Classification (FDOT): Class 5
Typical Section: EB & WB: 3 Lanes/ Raised Median
Posted Speed Limit: 45 mph

Figure 3.1: 2016 Existing Roadway and Intersection Lane Configurations

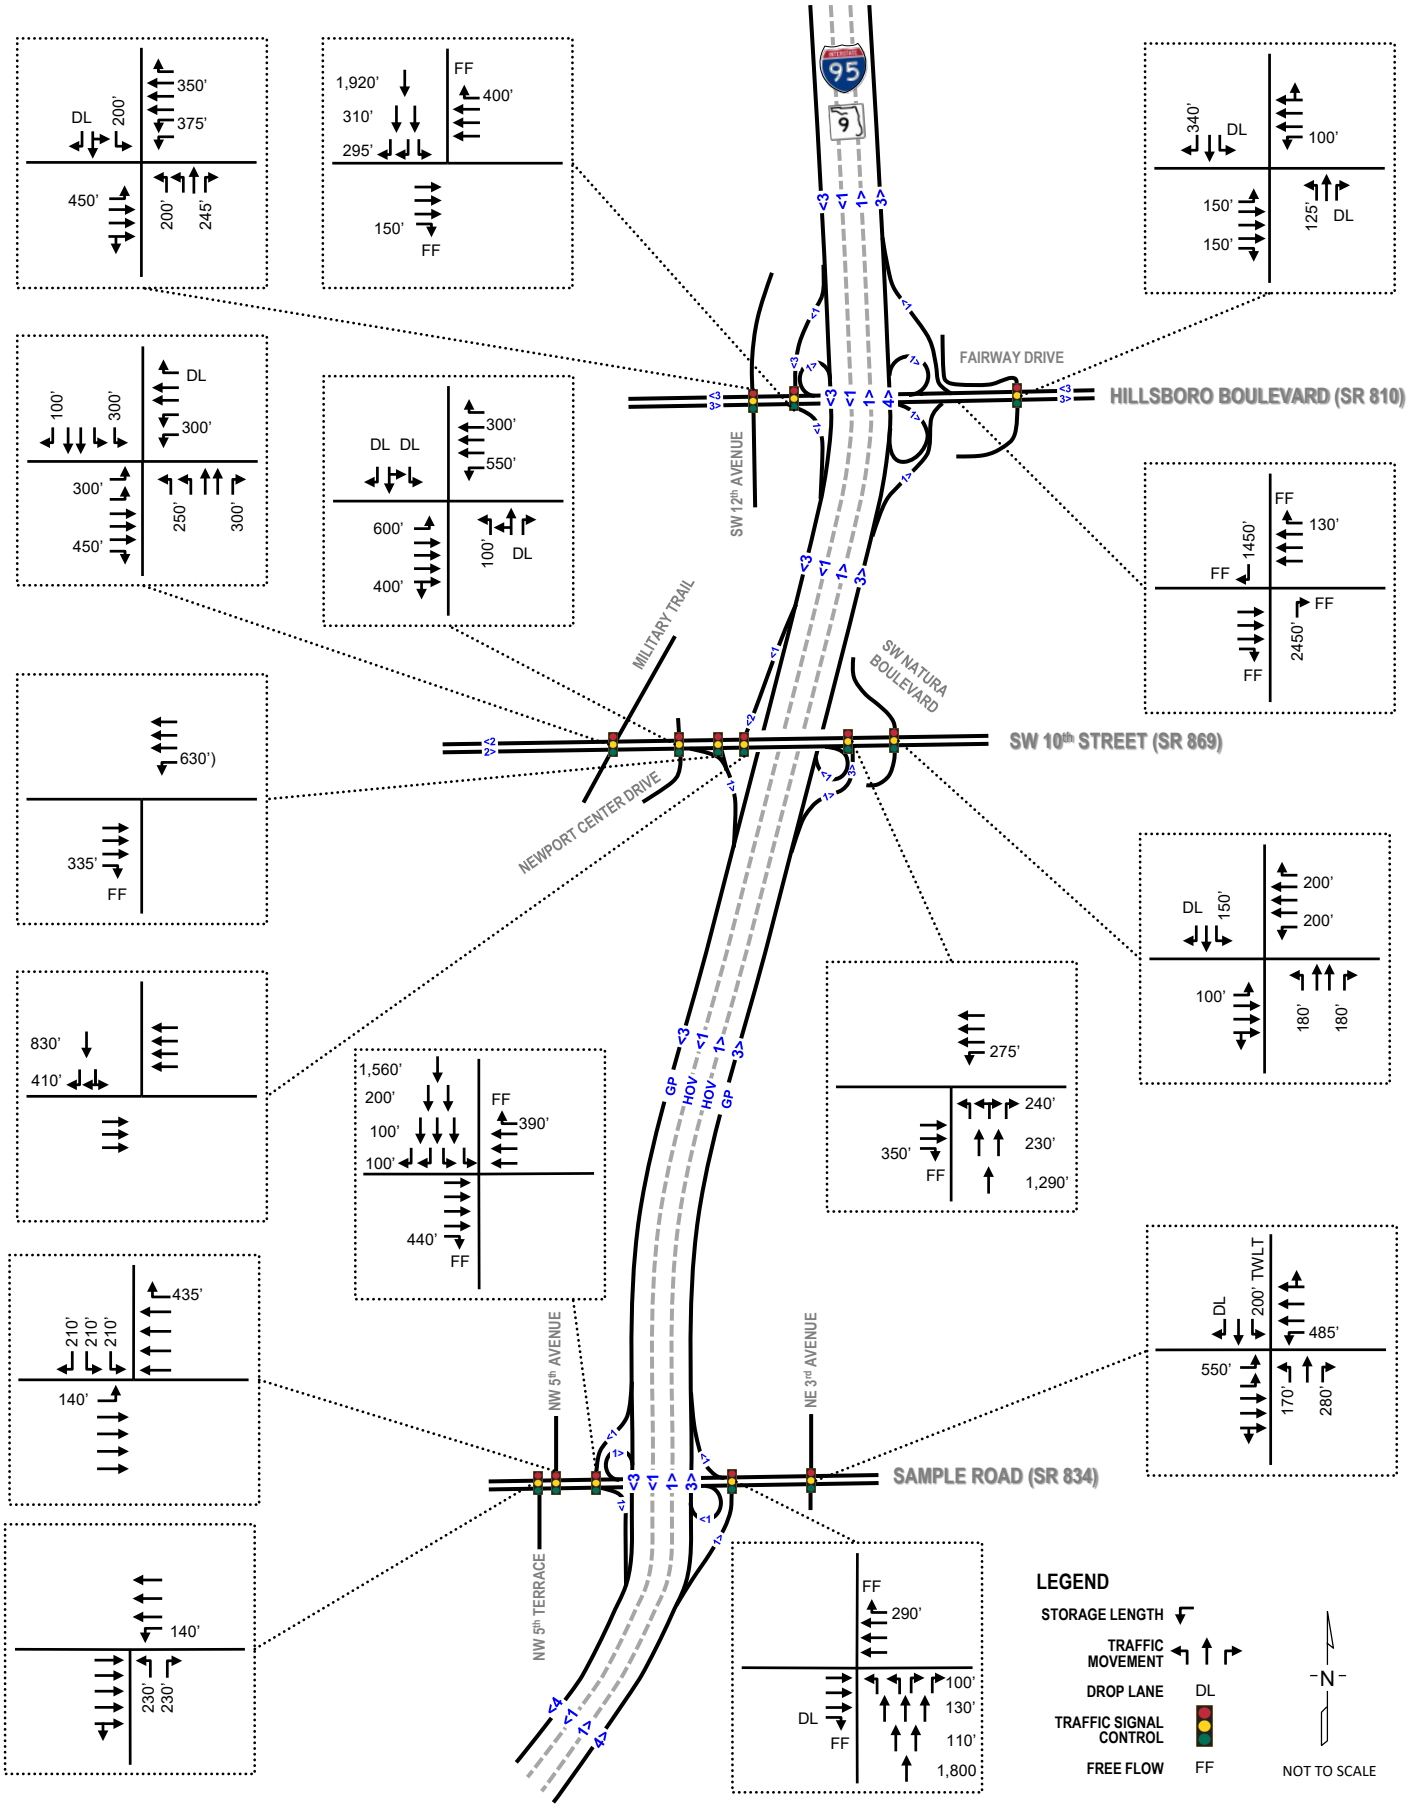


Figure 3.2: Aerial View - Hillsboro Boulevard (SR 810)

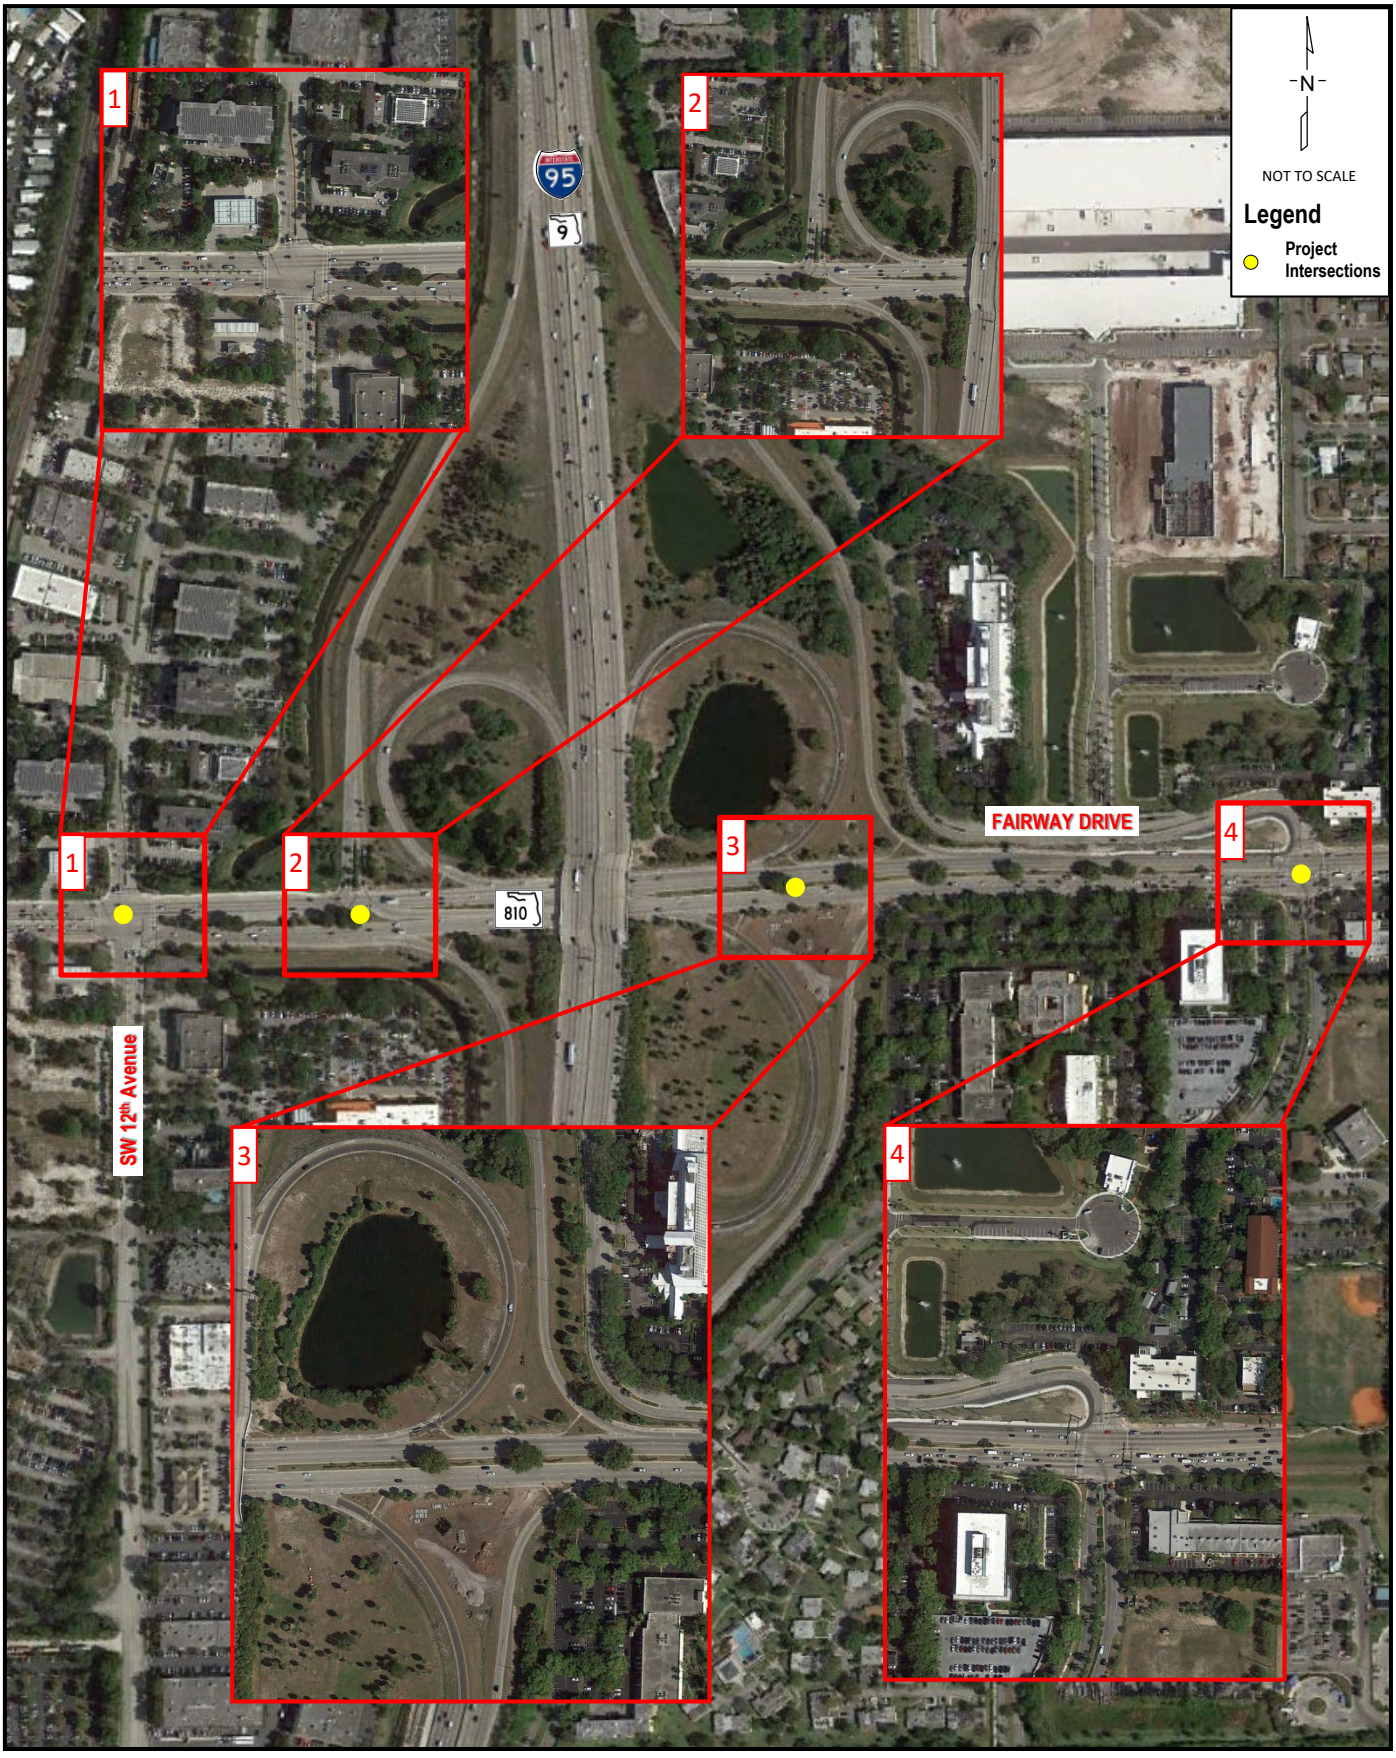

Figure 3.3: Aerial View - SW 10th Street (SR 869)

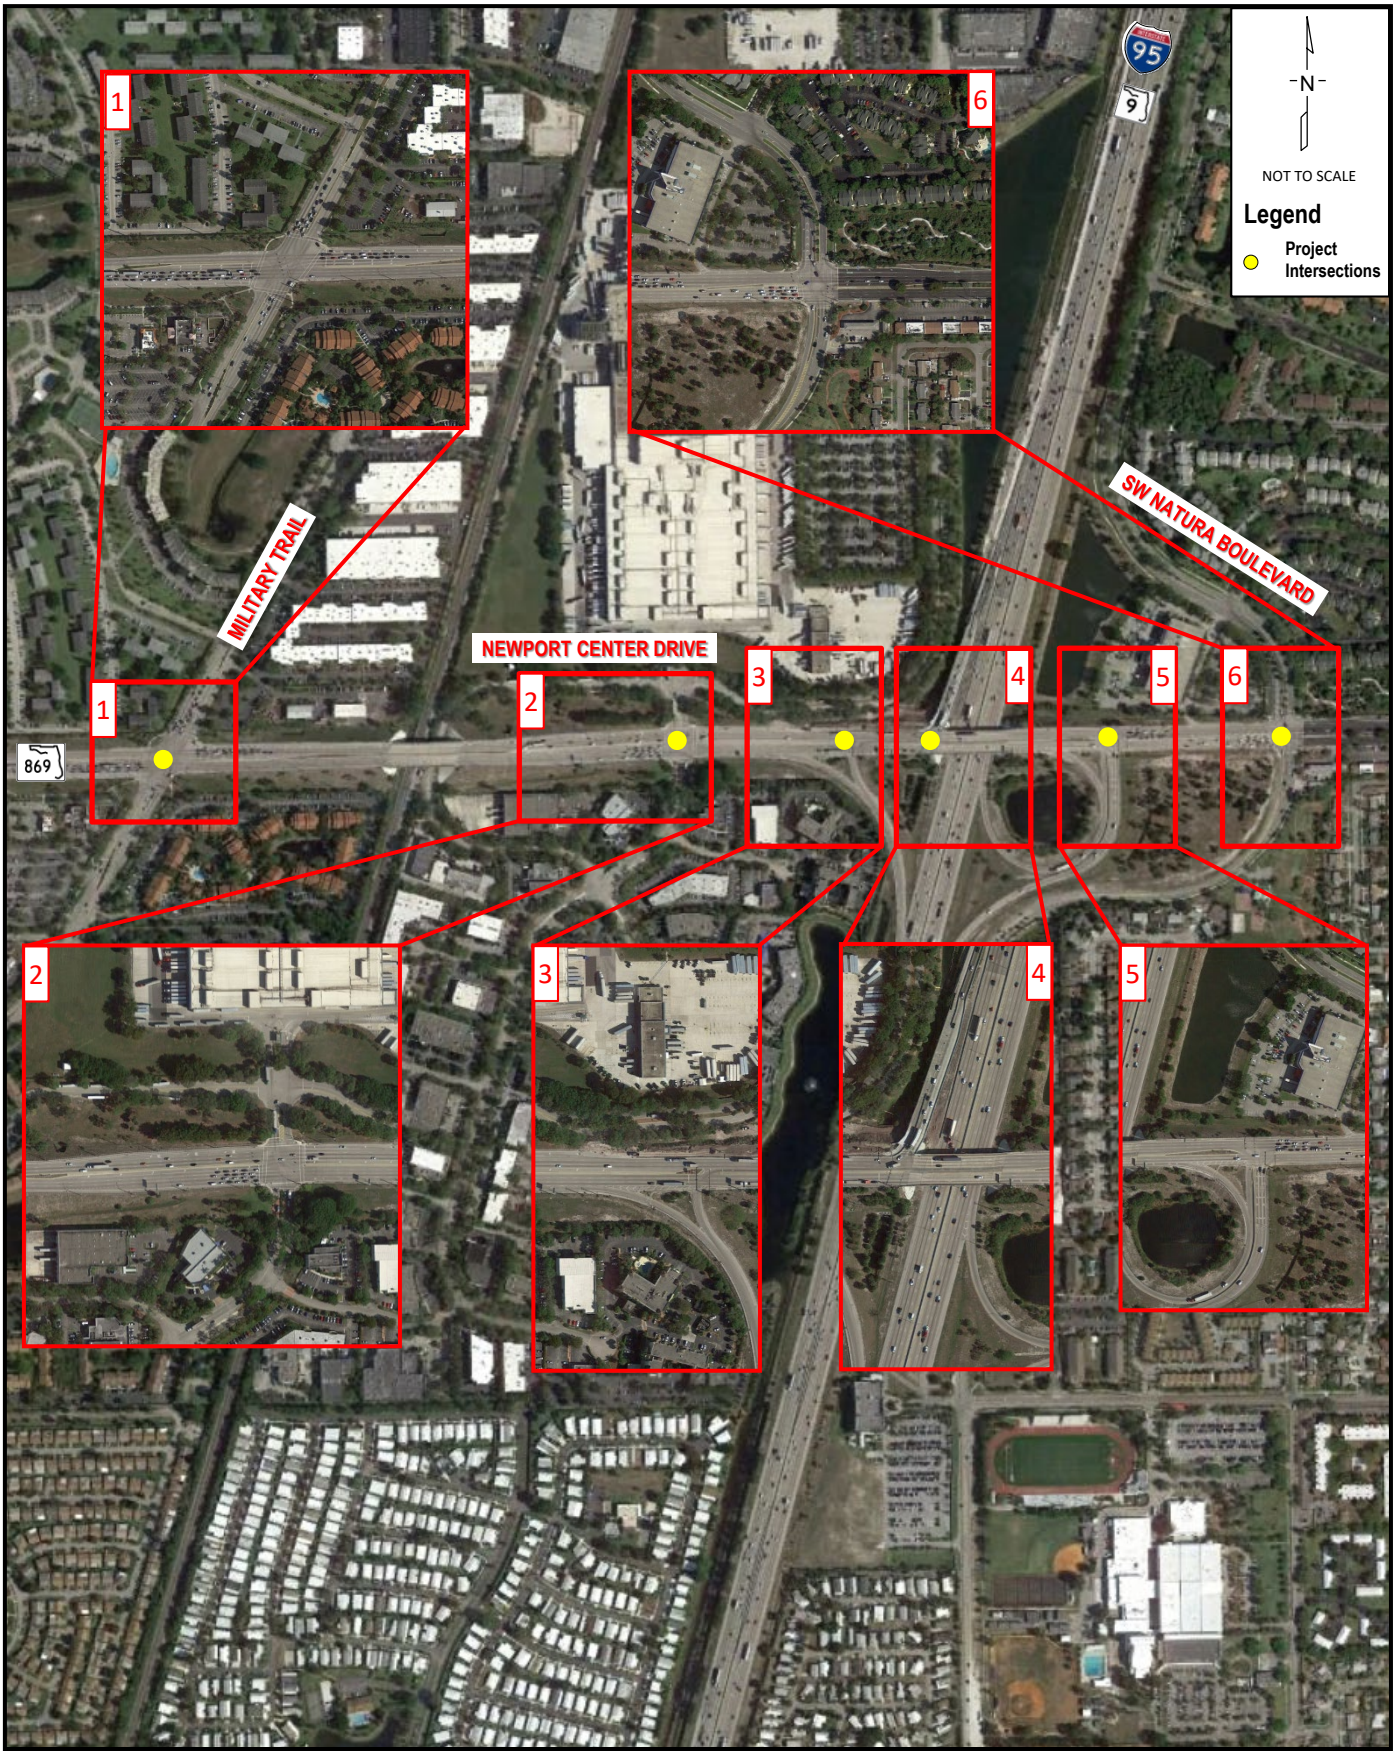

Figure 3.4: Aerial View – Sample Road (SR 834)

3.2 Existing Traffic Data

FDOT District 4 provided existing 2016 volumes that had been summarized in the *Traffic Data Collection & Traffic Projections for I-95 PD&E Study from SW 10th Street to Hillsboro Boulevard,* dated May 19, 2016. The data collection effort was completed March 8 through March 10, 2016.

As part of the SW 10th Street Connector PD&E Study (FPID 439891-1), a comparison of these volumes with volumes from previous studies revealed significant differences. In most cases, the District's March 2016 data showed lower volumes. In order to address the discrepancies and to supplement existing data, additional 4-hour turning movement counts were conducted at 16 locations and 2-day to 7-day directional machine counts were collected at 3 locations. These additional counts were collected by Florida's Turnpike Enterprise (FTE) between October 18 and October 25, 2016. The locations and summaries are documented in the *SW 10th Street PD&E Project Traffic Forecast Memorandum dated January 2019* prepared by FTE and included in Appendix F.

The additional counts verified that the March 2016 data presented lower volumes. Therefore, adjustments were made to develop balanced existing 2016 traffic volumes throughout the study area. I-95 ramp volumes were adjusted to volumes obtained as part of the Broward County Interchange Master Plan reports.

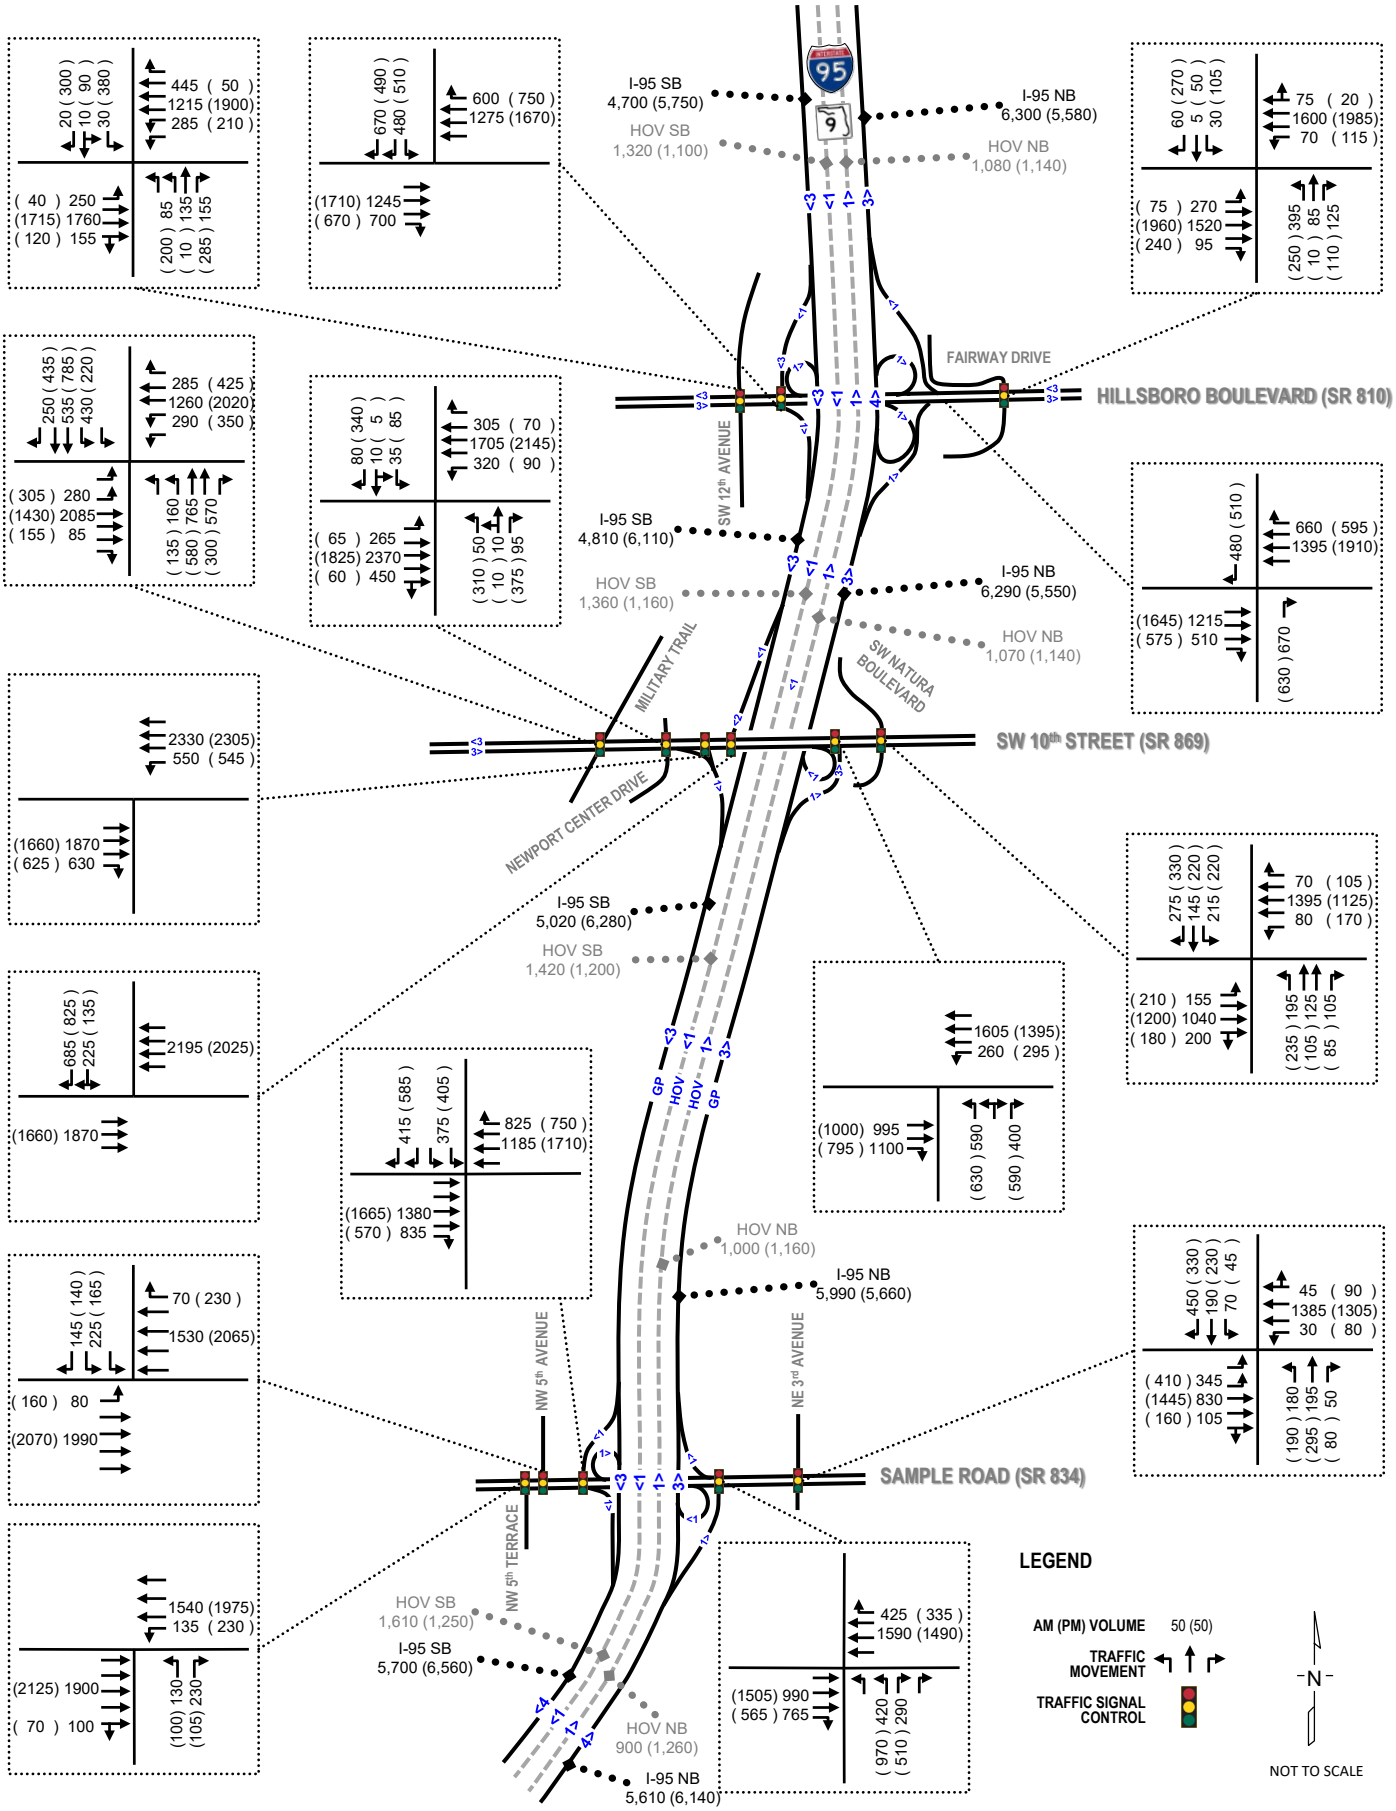
3.2.1 Existing Traffic Volumes

Figure 3.5 presents a summary of the balanced 2016 existing traffic volumes. The raw traffic counts and the existing signal timing is provided in **Appendix B**. These volumes are consistent with the ongoing SW 10th Street Connector PD&E Study.

3.3 Existing Traffic Operational Analysis

A traffic operational analysis was conducted to evaluate the existing conditions in the study area. Major analysis parameters include volume, design hour truck percentage, peak hour factor (PHF) and roadway geometry. The existing intersection PHFs were used for the intersection analysis. Design Hour Truck (DHT) values were calculated based on historical data from the FDOT count sites within the study area, mechanical classification counts and turning movement counts conducted as part of the I-95 PD&E Study data collection efforts. Peak hour values from mechanical counts were calculated as half the daily value in accordance with the FDOT Project Traffic Forecasting Handbook. The calculated DHT used for the I-95 mainline was 3.0%. The calculated DHT used was 2.0% for the ramps and for the interchange cross-streets.

Figure 3.5: 2016 Existing Volumes



3.3.1 Existing Traffic Freeway Operational Analysis – I-95

The measure of effectiveness used to estimate the LOS was density and volume to capacity ratio. The LOS for each freeway segment was determined using the corresponding HCS Freeways, Weaving or Ramps modules when applicable. When required by the specific geometry of a segment, additional ramp roadway (capacity checks) and/or major diverge analyses were conducted. Similarly, overlapping influence areas of on-ramp and off-ramp segments were analyzed both ways and the most restrictive output was reported. The upstream density of the major diverge areas was estimated using Equation 13-26 of the HCM. The capacity checks were documented as under capacity (Under) or over capacity (Over).

The HOV lane and corresponding volumes were excluded for the HCS analysis in order to be able to analyze the operating conditions of the general purpose lanes. The HOV lane demand was based on the data collection and analysis documented in the 2010 I-95 High-Occupancy Vehicle Lane Monitoring Report, dated May 2011. The report documents that the HOV northbound lane demand is approximately 16% of the total traffic for the AM and PM peak hours and the HOV southbound lane demand is approximately 16% and 18% for AM and PM peak hours, respectively. The percentile demand was applied to the provided existing volumes.

The mainline/basic, weaving, and ramp merge/diverge analysis results are summarized on **Figures 3.6** and **3.7** for Northbound and Southbound directions, respectively. Documentation of the existing traffic freeway operational analysis is provided in **Appendix C**. The results indicate that eight (8) of the sixteen (16) northbound freeway segments in the study area operate at LOS E or F during one or both of the peak hours and three (3) of the fifteen (15) southbound freeway segments in the study area operate at LOS E only during the PM peak hour.

THIS SPACE INTENTIONALLY LEFT BLANK

GPL: General Purpose Lane

3.3.2 Existing Traffic Intersection Operational Analysis

Intersection analysis for ramp-terminals and adjacent intersections was performed using existing turning movement volumes, existing lane geometry, and signal timing observations and information obtained from Broward County. The data was input into Synchro v9.1. The LOS and Delay was calculated utilizing Highway Capacity Manual (HCM) 2010 methodology where feasible. When the HCM 2010 methodology did not support the intersection characteristics, the Synchro HCM 2000 report was used. The intersection analyses are presented in **Appendix D**.

Tables 3.1 through **3.3** provide a detailed summary of the results of the signalized intersection analyses for the AM and PM peak hours for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. The results include delays (in seconds per vehicle) and Level of Service (LOS) by movement, approach, and the overall intersection. The volume to capacity (v/c) ratios and 95th percentile queue lengths have also been summarized by movement. The intersection analysis results indicate the following:

- Hillsboro Boulevard: One of the three signalized intersections operates at LOS E during the AM peak hour. The I-95 southbound off-ramp approach operates at LOS E during both peak hours.
- SW 10th Street: Two of the six signalized intersections operate at LOS F during one or both peak hours. The I-95 northbound and southbound off-ramp approaches operate at LOS F during both peak hours.
- Sample Road: All five signalized intersections operate at LOS D or better during both peak hours. The I-95 northbound and southbound off-ramp approaches operate at LOS D or better during both peak hours.

Table 3.4 summarizes the results of the off-ramp signals back of queue analyses for the AM and PM peak hours. HCM methodology does not provide queue lengths, therefore, the 95th percentile queues were obtained from Synchro reports. The Synchro reported queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length. The results present the queue length in feet for each lane group movement. The available storage length was calculated from the stop bar at the ramp terminal intersection to the gore with I-95 mainline, accounting for the changes in number of lanes. The analysis and field observations show that queues on the northbound and southbound off-ramps at SW 10th Street interchange exceed the available storage lengths and back up to the I-95 mainline through lanes during one or both peak hours. These queues exceeding the available storage are shown in red.

Table 3.1: 2016 Existing – Hillsboro Boulevard Intersection Analysis Results

Synchro Version 9.2.914.6. HCM 2000 MOEs reported.

LOS notes:

Delay is in sec/veh units

:Level of service (LOS) E reflecting at capacity operations

:Level of service (LOS) F reflecting over capacity operations

Queue notes:

HCM methodology does not report queues, results are from Synchro report outputs

~: Volume exceeds capacity, queue is theoretically infinite

#: 95th percentile volume exceeds capacity

m: Upstream metering is in effect

Table 3.4: 2016 Existing – Off-Ramp Signals Queuing Analysis Results

Intersection	Approach	Movement	Available Storage (ft)	Queue (ft)	
				AM	PM
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	#733	#738
		R (WB)	1,860	845	549
SW 10th Street at I-95 SB Off-Ramp	Southbound	L (EB)	620	#795	#958
		R (WB)	1,030	#846	#1001
SW 10th Street at I-95 NB Off-Ramp	Northbound	L (WB)	1,235	#802	#1,256
		R (EB)	1,235	#862	#1,299
Sample Road at I-95 SB Off-Ramp	Southbound	L (EB)	1,320	229	250
		R (WB)	1,320	266	#401
Sample Road at I-95 NB Off-Ramp	Northbound	L (WB)	1,405	266	#760
		R (EB)	1,405	192	333

Queue Notes:

Queue lengths exceeding the available storage are shown in Red.

Synchro queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length.

#: 95th percentile volume exceeds capacity

Example of Storage Length Calculation for SBRT at Hillsboro Blvd. = [(1920/2) + 310+ (295*2)] = 1,860 feet.

3.4 Existing Crash Data

Crash data was collected from the FDOT Crash Analysis Reporting System (CARS) for the three most recent years (from January 2013 to December 2015). Crash data along I-95 was collected between MP 21.000 and MP 25.317 including ramp segments and terminals. It was further segregated by interchange: Sample Road (SR 834) from MP 21.000 – MP 22.623; SW 10th Street (SR 869) from MP 22.623 – MP 24.150; and Hillsboro Boulevard (SR 810) from MP 24.150 – MP 25.317. Crash data for Sample Road (between NW 5th Terrace and NE 3rd Avenue), SW 10th Street (between Military Trail and SW Natura Boulevard), and Hillsboro Boulevard (between SW 12th Avenue and SW Natura Boulevard) was also obtained from the FDOT CARS. Historical Crash Maps and statistical summaries are included in **Appendix E**. **Table 3.5** presents the aggregated summary for I-95.

Others	0	0	0.0%	1	0	0.2%	0	0	0.0%
Contributing Causes	Hillsboro Blvd Interchange			SW 10th Street Interchange			Sample Road Interchange		
	Crashes	Annual Avg	Percent	Crashes	Annual Avg	Percent	Crashes	Annual Avg	Percent
No Contributing Action	64	21	10.3%	69	23	13.7%	90	30	15.7%
Careless Driving	319	106	51.3%	226	75	45.0%	249	83	43.5%
Failed to Yield ROW	5	2	0.8%	4	1	0.8%	5	2	0.9%
Improper Turn	1	0	0.2%	1	0	0.2%	0	0	0.0%
Drove Too Fast for Conditions	32	11	5.1%	16	5	3.2%	18	6	3.1%
Others	201	67	32.3%	186	62	37.1%	210	70	36.7%

Of the 1,696 reported crashes from 2013 through 2015, 970 (57%) were rear end crashes followed by 244 (14%) side-swipe crashes and 207 (12%) crashes involving fixed objects. Based on crash severity, of the 1,696 reported crashes, 1,069 (63%) were property damage only crashes, 623 (37%) were injury type crashes, and 4 (0%) were fatal crashes. There were a total of 530 (31%) night/dusk/dawn crashes reported, which is lower than the statewide average for all roadways of 34 percent; and 447 (26%) of the total crashes occurred under wet/slippery pavement conditions, which is higher than the statewide average for all roadways of 13 percent. Among the contributing causes documented in the crash data, Careless Driving (794 - 49%) and All Other (597 – 35%) were among the highest. There were 3 crashes involving pedestrians and bicycles. These types of crashes are atypical since pedestrians and bicycles are not allowed in access controlled facilities. It is important to note that the percentages for the major crash types and the contributing factors are almost similar across the three interchanges.

A High Crash Location List review was also conducted. The high crash location lists were obtained from FDOT District 4 Traffic Operations. The data was extracted from CARS, which uses crash coefficient levels over 99.95 % and crash rates over 1.00 to establish and rank high crash locations. The high crash locations within the 3-year analysis period for I-95 and Arterials based on the lists provided by FDOT are depicted on **Figure 3.8**. These locations are listed below and the years are identified within the parentheses.

High Crash Spots along I-95 from Sample Road to Hillsboro Boulevard (2013-2015)

- MP 21.280 – NB I-95 Off-Ramp to EB & WB Sample Road (2014)
- MP 21.330 - SB I-95 On-Ramp from EB Sample Road (2013, 2014)
- MP 21.522 – NB I-95 On-Ramp from EB Sample Road (2014)
- MP 21.910 – NB I-95 On-Ramp from WB Sample Road (2014, 2015)
- MP 24.400 – SB I-95 On-Ramp from EB Hillsboro Boulevard (2013, 2014, 2015)
- MP 24.711 – SB I-95 On-Ramp from WB Hillsboro Boulevard (2013, 2014, 2015)
- MP 24.732 – NB I-95 Off-Ramp to WB Hillsboro Boulevard (2013, 2015)

High Crash Spots along SW 10th Street from Military Trail to Natura Boulevard (2013-2015)

- MP 1.427 – at Military Trail (2013, 2014, 2015)
- MP 1.955 – at WB exit to SB I-95 (2013)
- MP 2.01 – at Natura Boulevard (2013, 2015)

High Crash Spots along Sample Road from NW 5th Terrace to NE 3rd Avenue (2013-2015)

- MP 7.410 – at NW 5th Terrace (2013, 2014, 2015)
- MP 7.443 – at the Driveway between NW 5th Terrace and NW 5th Avenue (2013, 2014)
- MP 7.459 – at NW 5th Avenue (2013, 2014)
- MP 7.659 – at SB I-95 Off-Ramp terminal (2015)
- MP 7.911 – east of NB I-95 Off-Ramp terminal (2015)
- MP 8.135 – at NE 3rd Avenue (2013, 2014)

Section 5.7 of this report documents the safety analyses that were conducted using the Highway Safety Manual (HSM) methodology and the traditional Crash Reduction Analysis to determine the benefits of the proposed improvements under the Build alternatives.

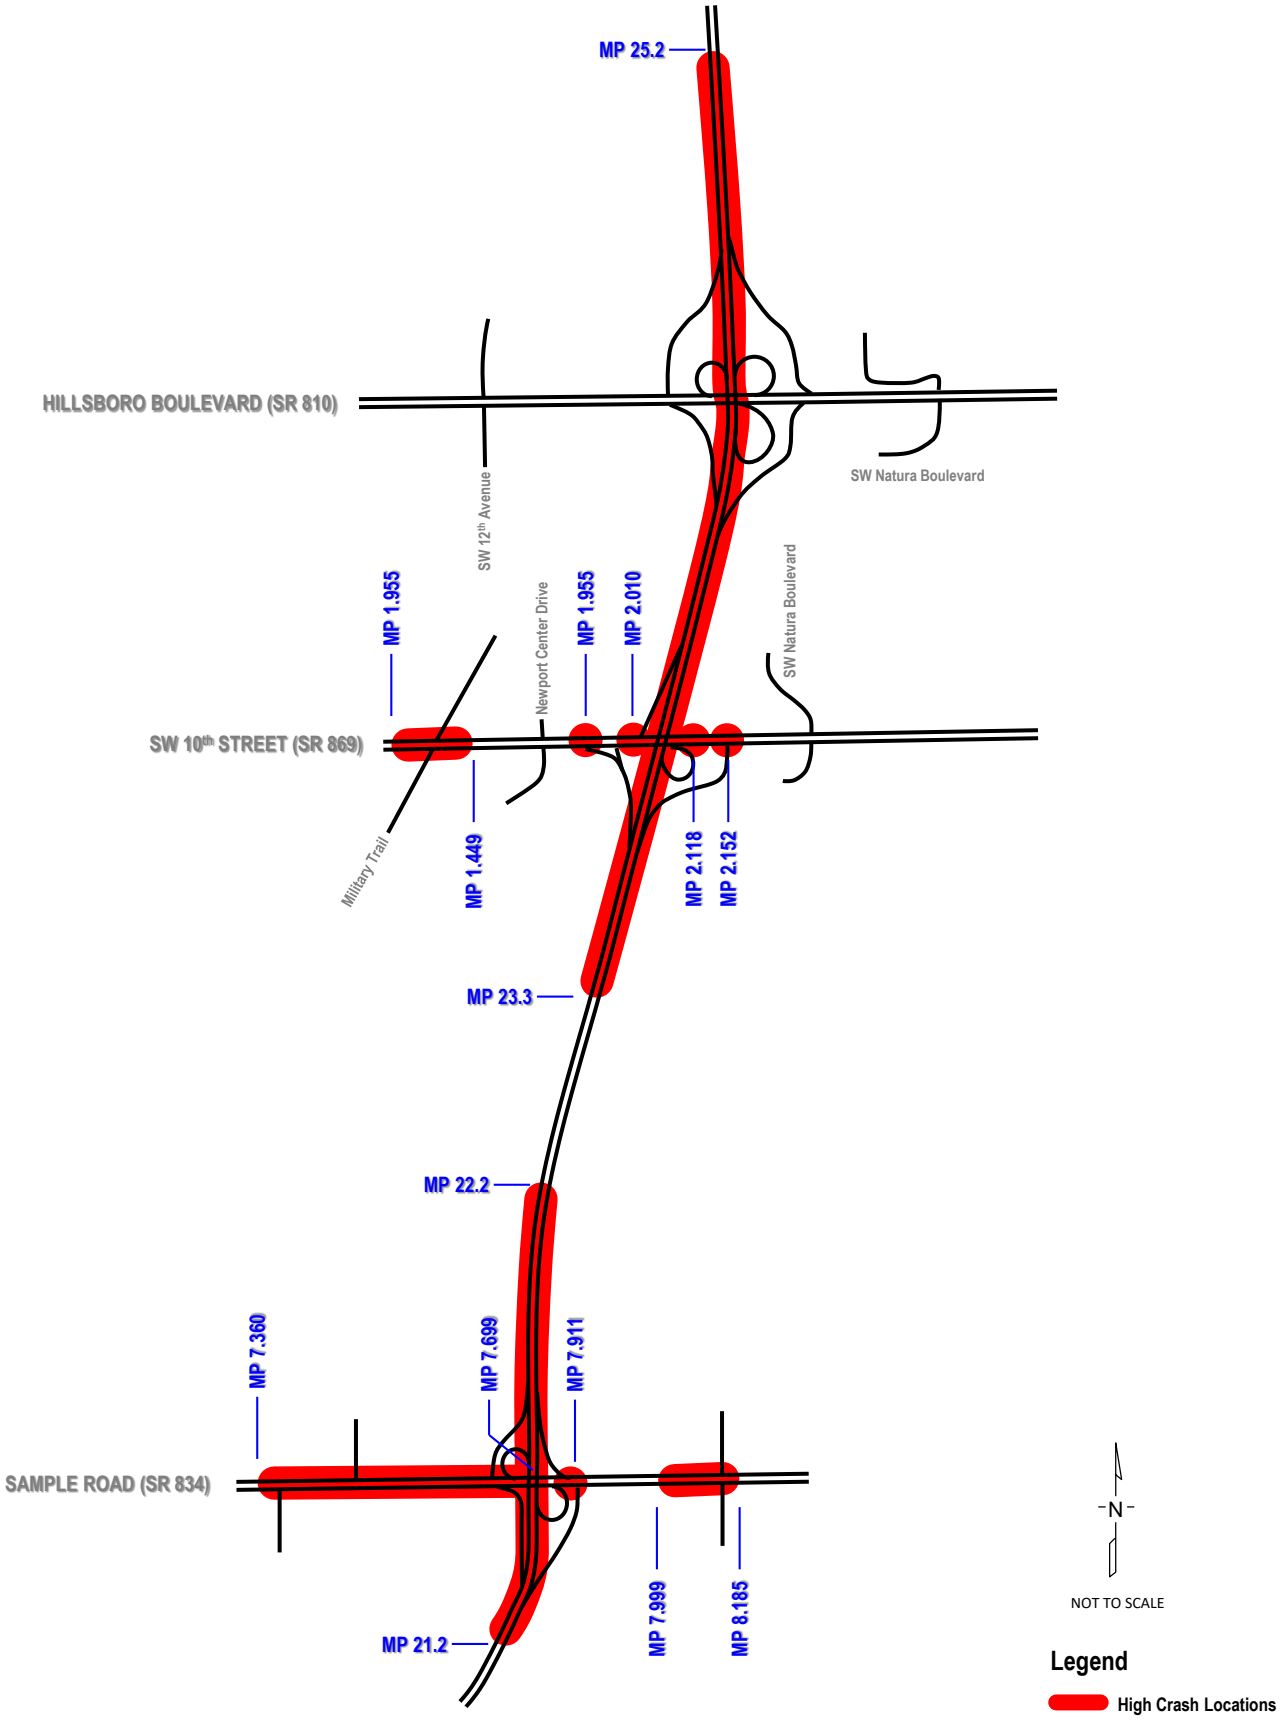
Figure 3.8: FDOT CARS High Crash Locations 2013 – 2015



4 FUTURE NO-BUILD CONDITIONS

4.1 Future Land Use

As previously stated, the three interchanges are located within the City of Deerfield Beach and the City of Pompano Beach. **Figure 4.1** presents the City of Deerfield Beach Future Land Use Map. The City of Pompano Beach Future Land Use Map is presented in **Figure 4.2**. The zoning maps show the following zone classifications for each interchange:

4.1.1 Hillsboro Boulevard Interchange

The City of Deerfield Beach Future Land Use Map shows the northwest quadrant of the Hillsboro Boulevard Interchange as Industrial and Commercial while the northeast quadrant is shown as Industrial, Commercial, Recreation Open Space and Employment Center. The southeast quadrant shows as Commercial, Residential Moderate (10 DU/AC) and Recreation Open Space. The southwest quadrant shows as Commercial, Industrial and the York Residential Transit Oriented Development.

4.1.2 SW 10th Street Interchange

The City of Deerfield Beach Future Land Use Map shows the area west of the SW 10th Street interchange as Industrial. The northeast quadrant of the interchange is shown as Residential Moderate (10 DU/AC), Commercial and Conservation. The southeast quadrant shows as Community Facility, Recreation Open Space, Residential Low (5 DU/AC), Residential Moderate (10 DU/AC), and Residential Medium (15 DU/AC).

4.1.3 Sample Road Interchange

The City of Deerfield Beach Future Land Use Map shows the northwest quadrant of the interchange as Low Density Residential Low (5 DU/AC) and the northeast quadrant as Community Facility, Office Park and Commercial. The City of Pompano Boulevard Future Land Use Map shows the Southeast quadrant as Commercial, Community Facilities and Residential – Low (1-5 DU/AC), Low-Medium (5-10 DU/AC) and Medium (10-16 DU/AC). The Southeast quadrant shows as Commercial and Residential – Medium (10-16 DU/AC) and Medium High (16-25 DU/AC).

THIS SPACE INTENTIONSALLY LEFT BLANK

Figure 4.1: Zoning Map – City of Deerfield Beach Future Land Use Map

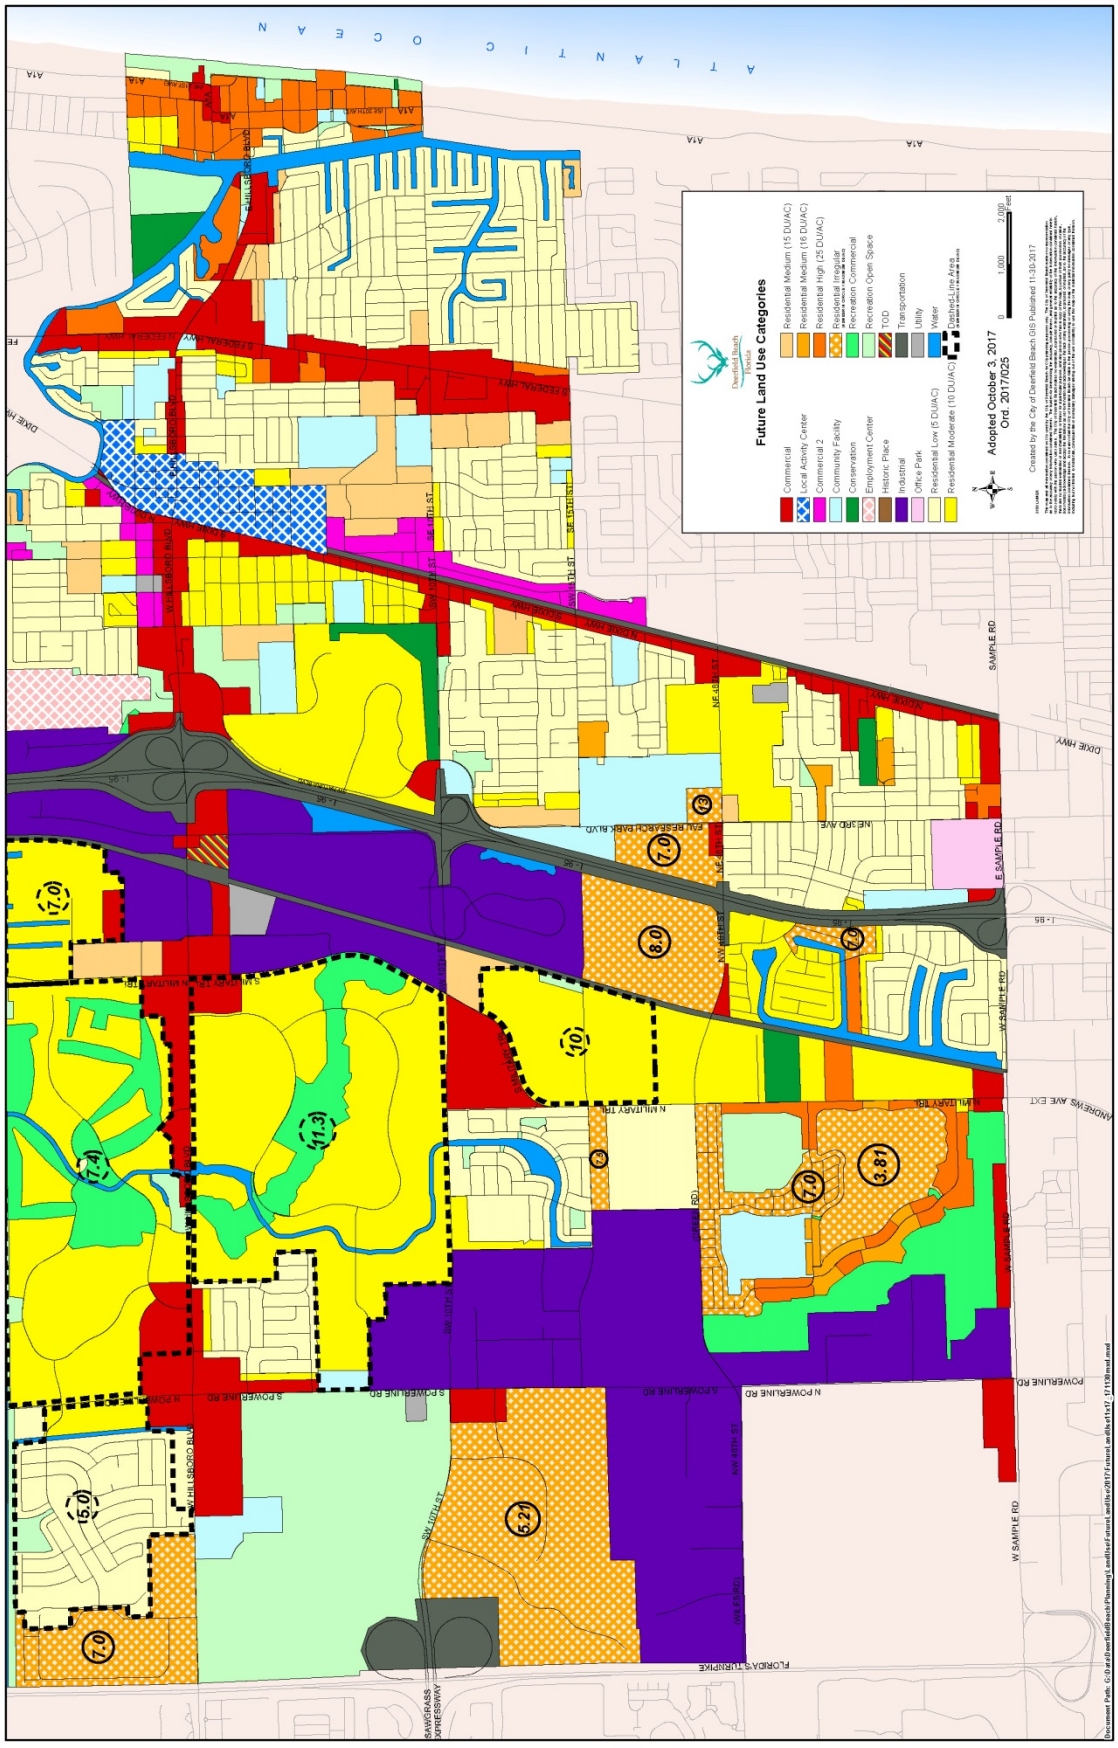


Figure 4.2: Zoning Map – City of Pompano Beach Future Land Use Map

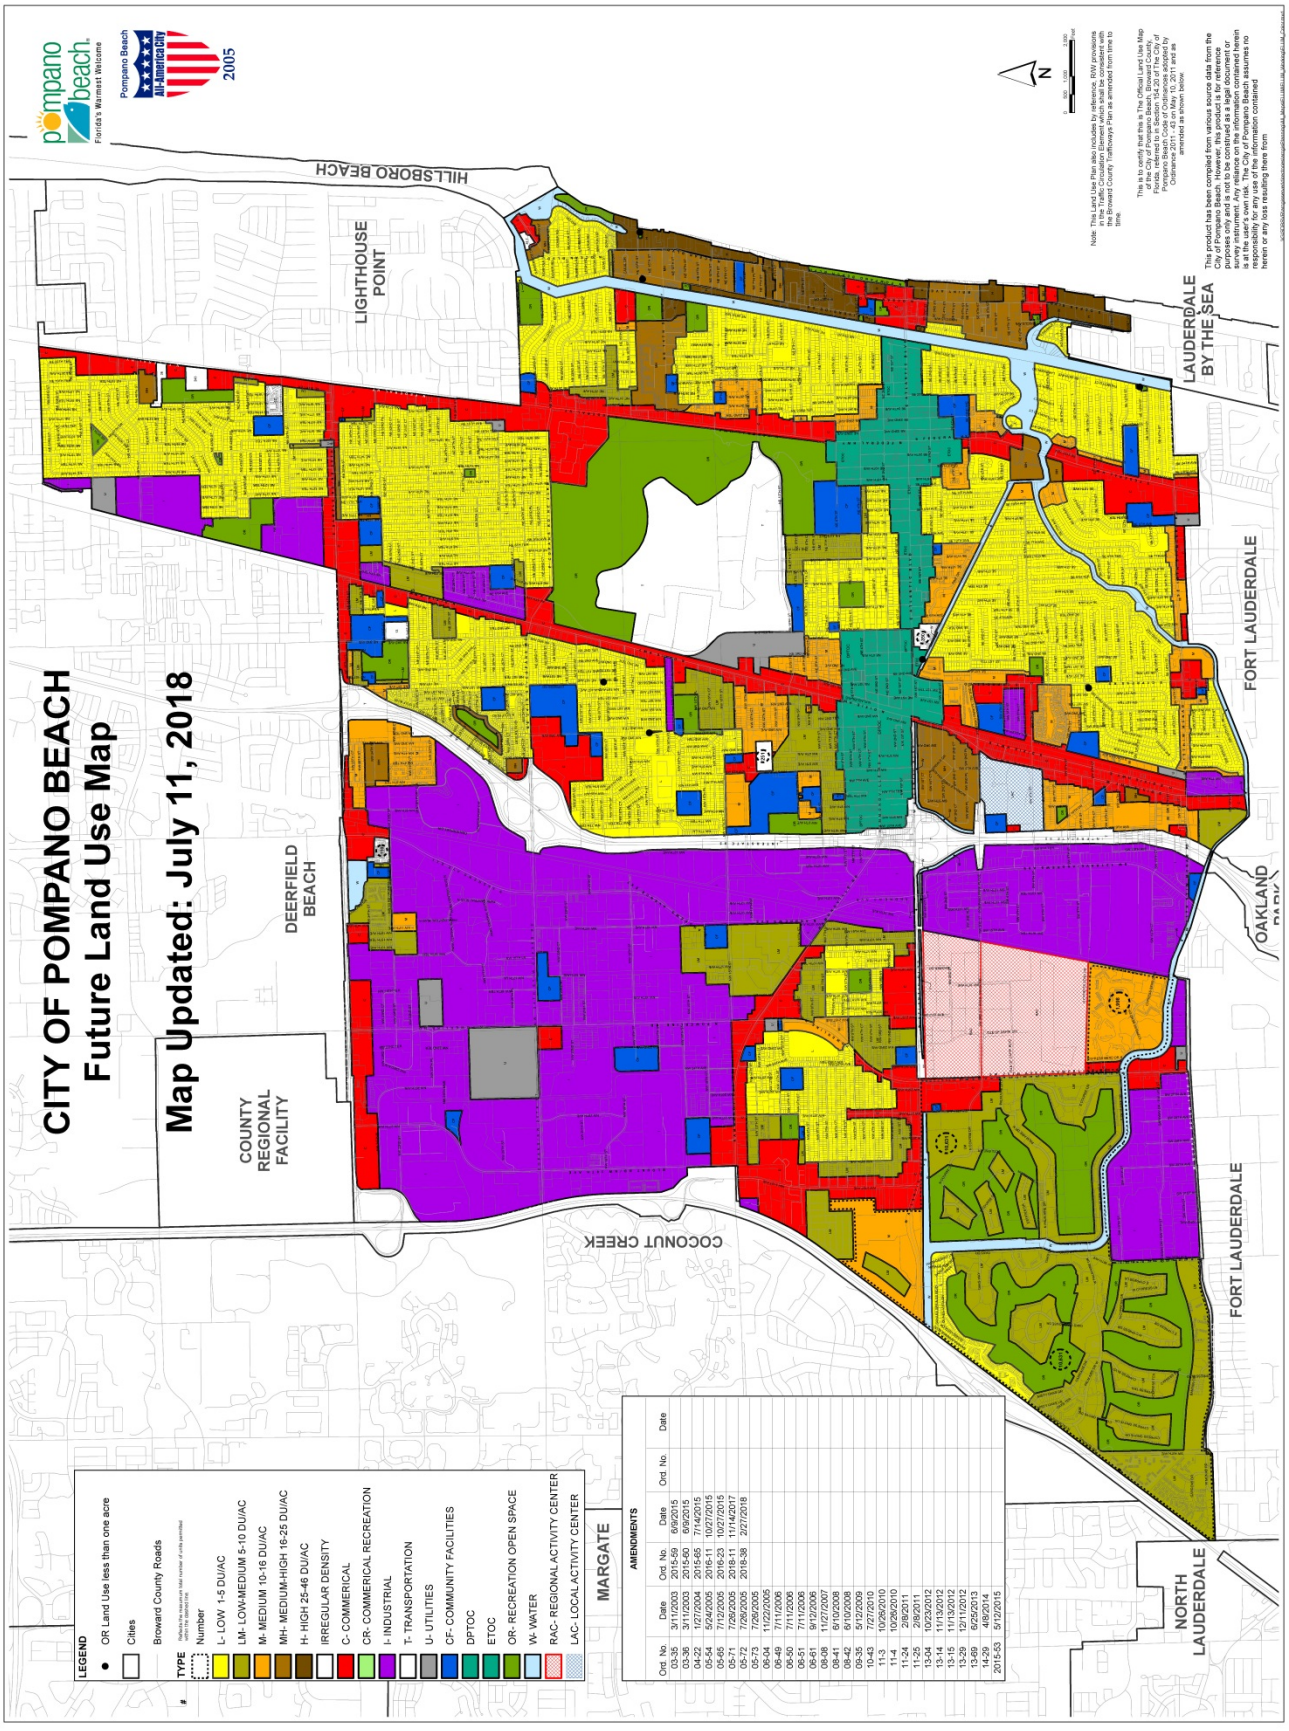

4.2 Land Use Change

No significant future land use changes were identified in the project area. For traffic projection purposes, the base SERPM Version 6.5 model utilizes MPO developed 2005 base year and 2035 LRTP horizon year data; therefore, TAZ data for the 2010 and 2040 analysis years were interpolated/extrapolated from the available 2005 and 2035 data. The interpolated 2010 and extrapolated 2040 TAZ data developed for the I-95 PD&E Study (Stirling Road to Linton Boulevard) was used for this project. The 2040 TAZ data was developed by extrapolation of the MPO-approved 2035 TAZ data, via benchmarking the County Control totals to Bureau of Economic and Business Research (BEBR) projections, consistent with previous revisions of the I-95 Corridor Planning Study (CPS) Model.

4.3 No-Build Alternative – Transportation Network

The future year No-Build Alternative network includes the existing (2015/2016) roadway conditions plus all funded and committed projects within the study corridor as described in Section 1.3-Planned and Programmed Transportation Projects of this SIMR. **Figure 4.3** presents the Future No-Build Alternative Lane Configuration.

4.4 Future Traffic Forecast

As mentioned previously, traffic forecasting was a coordinated effort between FDOT District 4 and the Turnpike. In order to maintain consistency with the on-going SW 10th Street Connector PD&E Study, traffic projections for both the No-Build and Build conditions were obtained from the recently published *SW 10th Street Connector PD&E Study Project Traffic Forecast Memorandum (PTFM)* dated January 2019 (FPID 439891-1). Section 4 of the PTFM provides a detailed description of the modeling methodology and the development of the Directional Design Hour volumes (DDHVs). The complete document is included in **Appendix F**. **Figures 4.4** and **4.5** present the No-Build Traffic Projection Volumes for Opening Year 2020 and Design Year 2040, respectively.

THIS SPACE INTENTIONALLY LEFT BLANK

Figure 4.3: No-Build Roadway and Intersection Lane Configurations

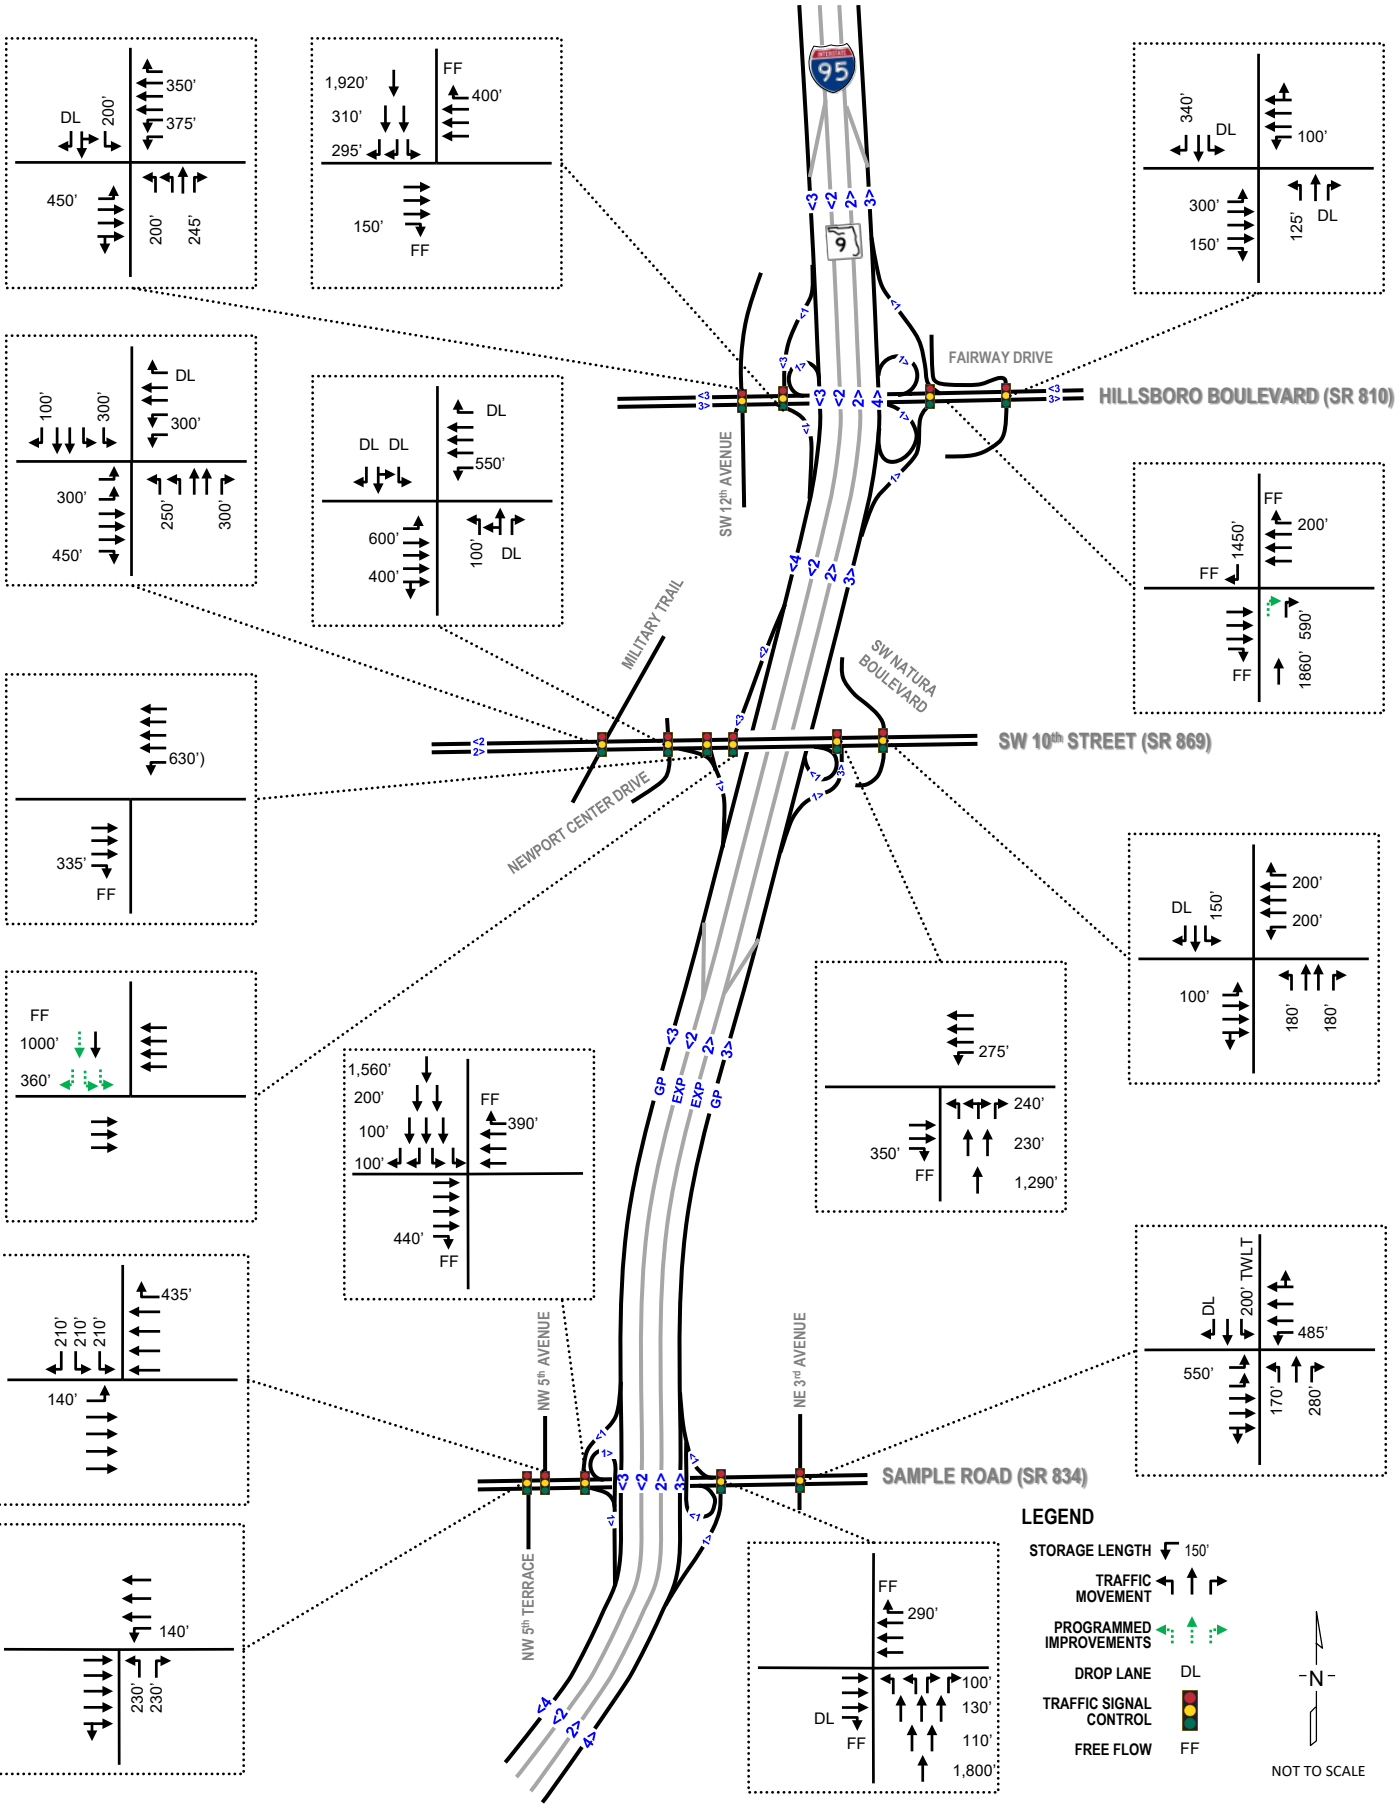

Figure 4.4: 2020 No-Build Volumes

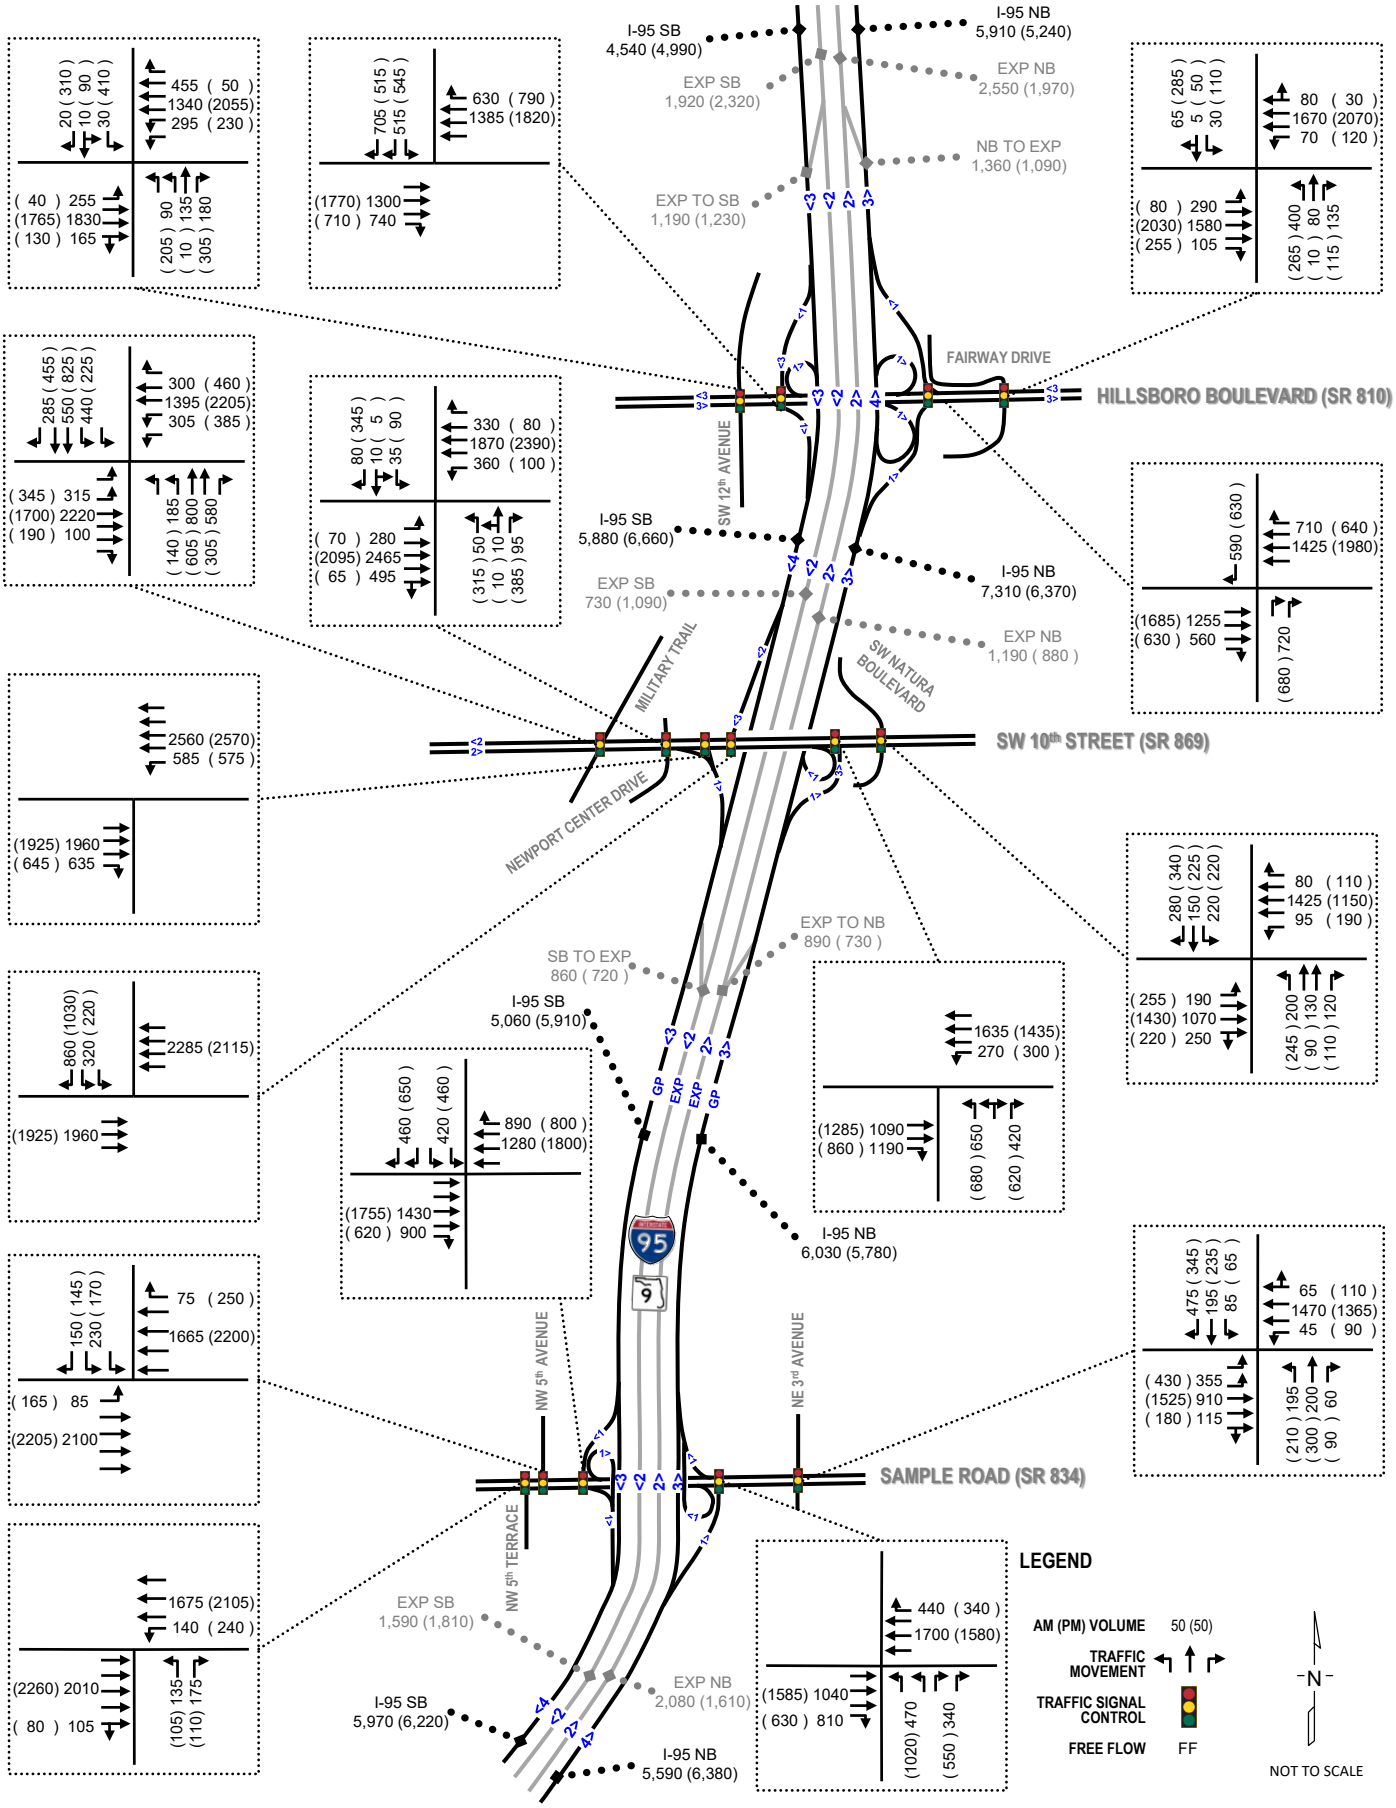

Figure 4.5: 2040 No-Build Volumes

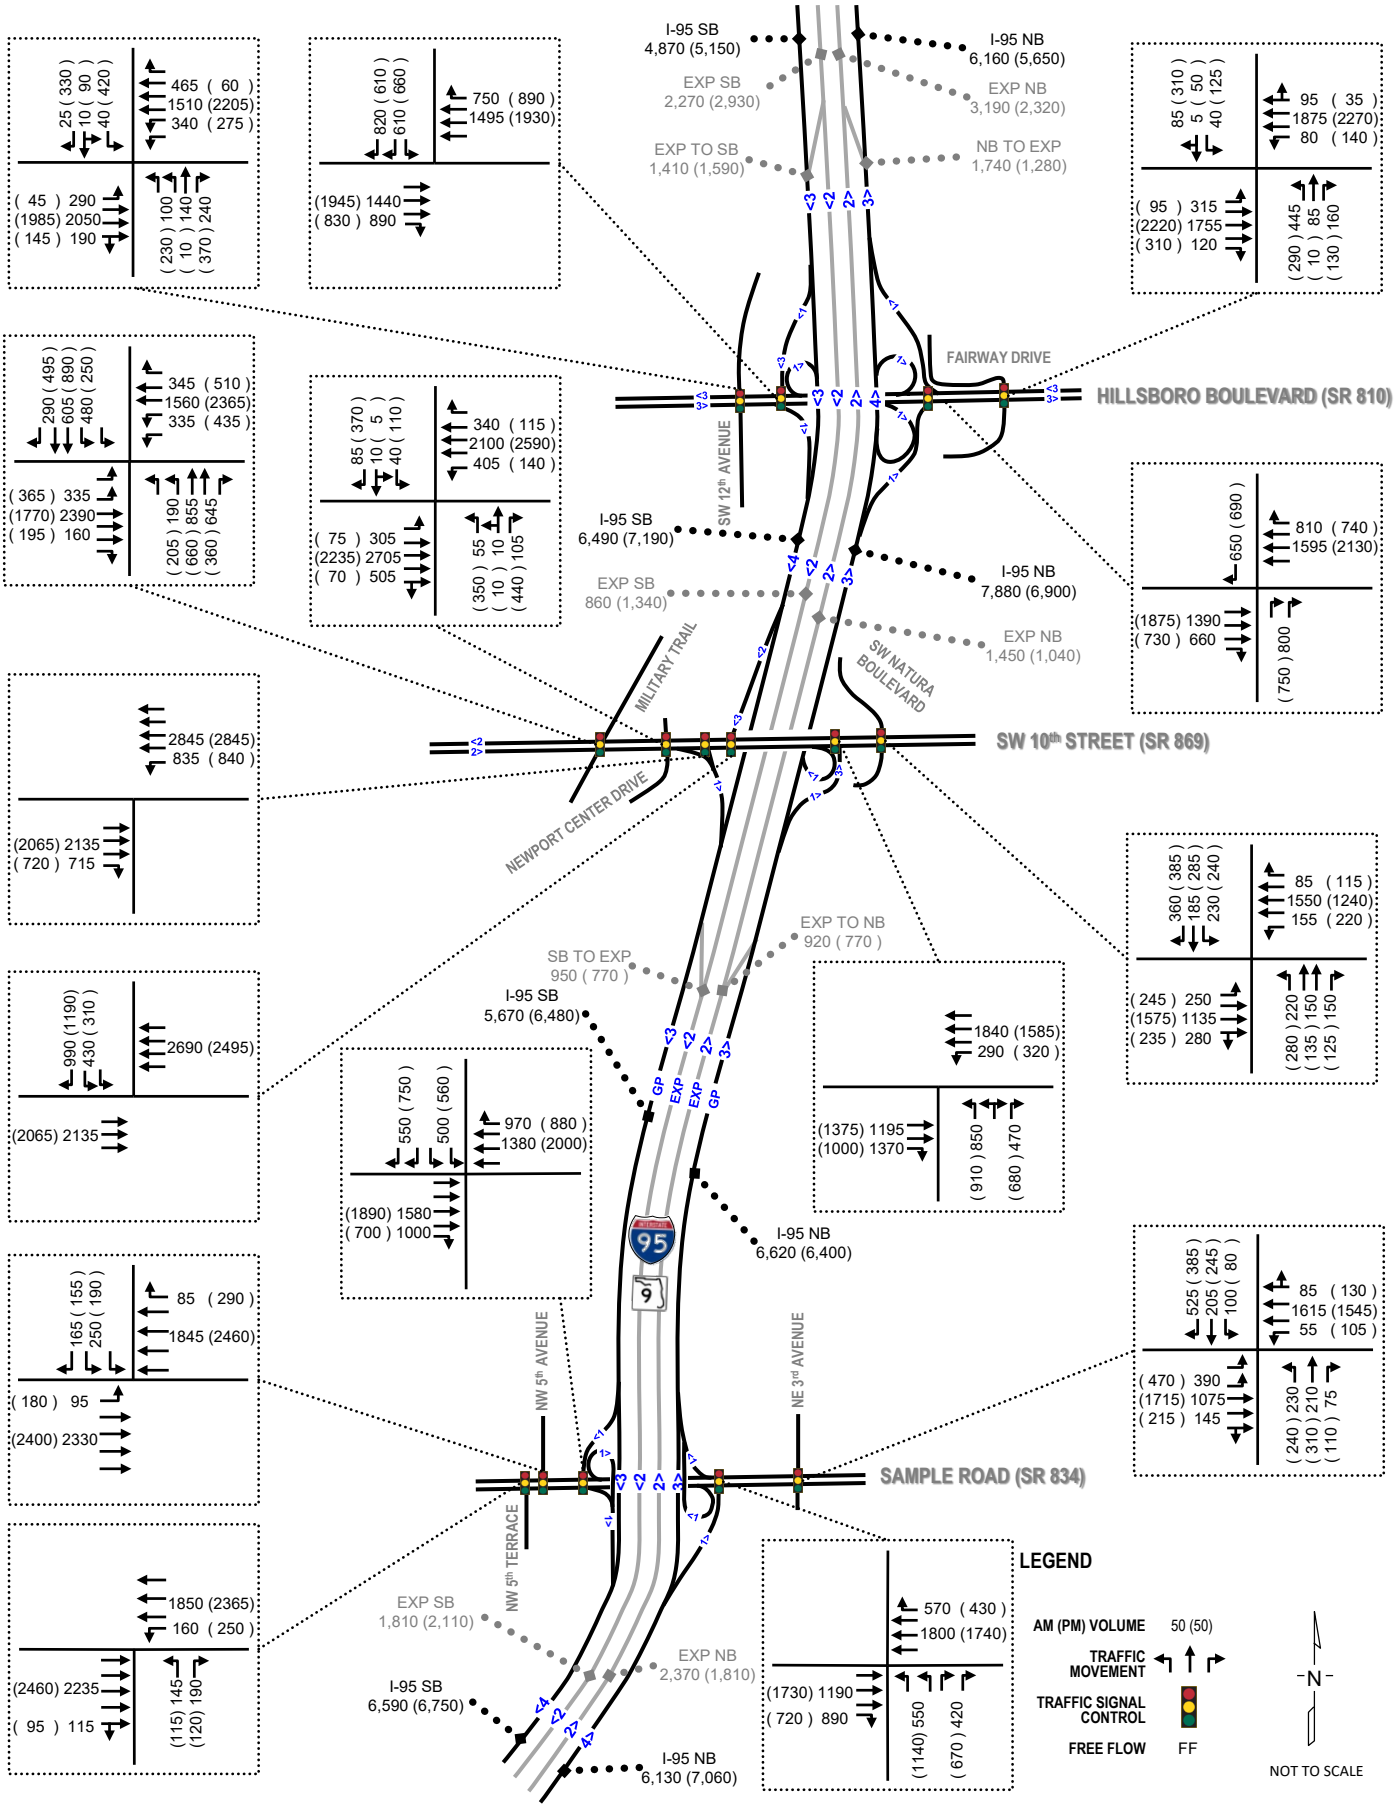

4.4.1 2020 & 2040 No-Build – Freeway Analysis – I-95

The No-Build analysis includes the implementation of I-95 Express Lanes. The mainline/basic, weaving, and ramp merge/diverge analysis results for Opening Year 2020 are summarized and depicted on **Figures 4.6** and **4.7** for the NB and SB directions, respectively. The Design Year 2040 analysis results are summarized and depicted on **Figures** in **4.8** and **4.9** for the NB and SB directions, respectively. Documentation of the 2020 and 2040 No-Build Alternative traffic freeway operational analysis is provided in **Appendix G**. The Design Year 2040 No-Build Alternative analysis indicates that 15 of the 16 freeway segments in the NB direction are projected to operate at LOS E or F during one or both peak hours. Similarly, 9 of the 14 freeway segments in the SB direction are projected to operate at LOS E or F during one or both peak hours.

4.4.2 2020 & 2040 No-Build - Intersection Analysis

Intersection analysis for ramp-terminals and adjacent intersections was performed in a similar manner as for the existing conditions. The No-Build Alternative includes the existing intersection control and lane geometry. **Figure 4.3**, previously presented, presents the No-Build Alternative Lane Configuration and **Figures 4.4** and **4.5**, previously presented, show the AM and PM intersection volumes for 2020 and 2040 conditions, respectively. Signal timing was optimized to reflect routine maintenance operations. **Appendix H** presents the intersection analysis worksheets.

Tables 4.1 through **4.3** summarize the results of the 2020 No-Build signalized intersection analyses for the AM and PM peak hours for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. **Tables 4.4** through **4.6** summarize the results of the 2040 No-Build signalized intersection analyses for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. The results include delays (in seconds per vehicle) and Level of Service (LOS) by movement, approach, and the overall intersection. The volume to capacity (v/c) ratios and 95th percentile queue lengths have also been summarized by movement. The intersection analysis results indicate the following for the 2040 Design Year:

- Hillsboro Boulevard: Two of the three signalized intersections are expected to operate at LOS E during the AM or PM peak hours. The I-95 northbound and southbound off-ramp intersections are expected to operate at LOS C or better during both the AM and PM peak hours.
- SW 10th Street: Three of the six signalized intersections are expected to operate at LOS E or F during one or both peak hours. The I-95 northbound off-ramp approach is expected to operate at LOS F during both peak hours. The I-95 southbound off-ramp approach is expected to operate at LOS C or better during both peak hours.

Synchro Version 9.2.914.6. HCM 2000 MOEs reported.

LOS notes:

Delay is in sec/veh units

:Level of service (LOS) E reflecting at capacity operations

:Level of service (LOS) F reflecting over capacity operations

Queue notes:

HCM methodology does not report queues, results are from Synchro report outputs

~: Volume exceeds capacity, queue is theoretically infinite

#: 95th percentile volume exceeds capacity

m: Upstream metering is in effect

- Sample Road: All five signalized intersections are expected to operate at LOS D or better during both peak hours. The I-95 northbound and southbound off-ramp approaches are expected to operate at LOS D or better during both peak hours.

Table 4.7 summarizes the results of the off-ramp signals back of queue analyses for the AM and PM peak hours for 2020 and 2040 No-Build conditions. HCM methodology does not provide queue lengths. The 95th percentile queues were obtained from Synchro reports. The Synchro reported queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length. The results present the queue length in feet for each lane group movement. The available storage length was calculated from the stop bar at the ramp terminal intersection to the gore with I-95 mainline, accounting for the changes in number of lanes. The analysis indicates that the queues on the off-ramps are not expected to exceed the available storage lengths.

Table 4.7: 2020 & 2040 No-Build – Off-Ramp Signals Queuing Analysis Results

Intersection	Approach	Movement	Available Storage (ft)	Queue (ft)	
				AM	PM
2020 No-Build					
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	653	499
		R (WB)	1,860	788	375

Sample Road at I-95 NB Off-Ramp	Northbound	L (WB)	1,405	277	947
		R (EB)	1,405	222	514

Queue Notes:

Synchro queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length.

#: 95th percentile volume exceeds capacity

Example of Storage Length Calculation for SBRT at Hillsboro Blvd. = [(1920/2) + 310+ (295*2)] = 1,860 feet.

5 FUTURE BUILD CONDITIONS

5.1 Build Alternative – Transportation Network

The future Build Alternative network incorporates all the roadway improvements described under Section 4.3 and depicted in Figure 4.3 for the No-Build Alternative plus the proposed improvements to mitigate deficiencies identified in the No-Build Alternative, when feasible. The Build Alternative maintains the typical section from the No-Build Alternative along I-95 between interchanges (i.e., no through lanes along I-95 are added.)

5.2 Future Build Alternative Traffic Forecast

Traffic projections were obtained from the *Project Traffic Forecast Memorandum (PTFM)* dated January 2019 for the SW 10th Street Connector PD&E Study (FPID 439891-1).

5.3 Development and Screening of Build Alternatives

Based on the evaluation of the No-Build conditions, various Build alternatives were developed and analyzed for the I-95 and SW 10th Street SIMR (FPID 436964-1) and the SW 10th Street Connector PD&E Study (FPID 439891-1). Traffic evaluations were conducted for two different Build Alternatives (a Center Alignment and a Northern Alignment for the proposed managed lanes), with six different managed lane ingress and egress configurations resulting in a total of twelve (12) Build Alternatives.

The fifteen scenarios (existing 2016 conditions, 2040 No-Build conditions, 2040 Partial Build conditions, and twelve 2040 Build conditions) were first analyzed by conducting a Tier 1 volume to capacity ratio analysis of the SW 10th Street general use lanes and proposed managed lanes. In addition, the vehicle-miles traveled in the managed lanes during the peak hours for each of the twelve Build alternatives were calculated and compared. Subsequently, a Tier 2 intersection operations analysis was completed for the signalized intersections along SW 10th Street. A Tier 2 freeway analysis of the proposed managed lanes connecting the Sawgrass Expressway, Florida's Turnpike and I-95 was also completed. The peak hour traffic operations analysis results were reviewed to screen the twelve Build alternatives for any traffic operations fatal flaws, and a comparison of results was used to identify the most advantageous Build Alternatives to be considered further.

Overall, Tier 1 and Tier 2 analyses resulted in the selection of the North Build Alternative 3D-1.3 and the Center Build Alternative 3D-1.3 as the top ranked alternatives. VISSIM microsimulation was conducted to further evaluate these two shortlisted alternatives. The North Build Alternative 3D-1.3 was projected to provide better operating conditions than the Center Build Alternative. Hence, the PTFM identified the North Build Alternative 3D-1.3 as the best

Build Alternative based on projected traffic operations and was further refined to improve the overall operations. An *Alternatives Analysis Memorandum* documenting the development and screening of various alternatives for SW 10th Street and I-95 was submitted to FDOT District 4 on June 29, 2018 and is included in **Appendix I**. Based on the conclusions of the PTFM, Alternatives Analysis Memorandum, and directions received from the Department, the following three Build Alternatives were considered for this SIMR.

Build 1 Alternative: This Build alternative has been identified as an alternative without the direct-connect ramps to and from I-95 but includes all other freeway and arterial improvements proposed under Build 2 and Build 3 alternatives below. The traffic forecast for this alternative is similar to the No-Build forecast.

Build 2 Alternative: This Build alternative has been identified as the Partial Build alternative in the PTFM and in the *Alternatives Analysis Memorandum* dated June 2018. The Partial-Build/Build 2 alternative provides for grade-separated direct-connect ramps to and from the I-95 Express lanes extending just west of Military Trail. Also, there are no entry or exits ramps on the direct-connect ramps between Military Trail and I-95.

Build 3 Alternative: This Build alternative has been identified as Build Option 3D-1.3 (North Alignment) in the PTFM and in the *Alternatives Analysis Memorandum* dated June 2018. Build 3 provides for grade separated express lanes along SW 10th Street from I-95 to Sawgrass Expressway with express lane overpass at all signalized intersections. It provides for an EB exit ramp and a WB entrance ramp on the express lanes between Military Trail and I-95.

It is important to note that except or the direct-connect ramps, the geometric configuration for Build 1, 2 and 3 alternatives are similar within the SIMR study limits and the area of influence. However, the traffic projections for Build 1 are the same as the No-Build but the Build 3 traffic projections are different than Build 2 due to the presence of express lanes between I-95 and Sawgrass Expressway. The conceptual plans for the Build 1, Build 2, and Build 3 alternatives are included in **Appendix J**.

Figure 5.1 shows the Roadway and Intersection Lane Configuration for Build 1 and **Figure 5.2** shows it for both Build 2 and Build 3 alternatives and includes the following improvements in addition to the No-Build improvements:

THIS SPACE INTENTIONALLY LEFT BLANK

Figure 5.1: Build 1 - Roadway and Intersection Lane Configurations

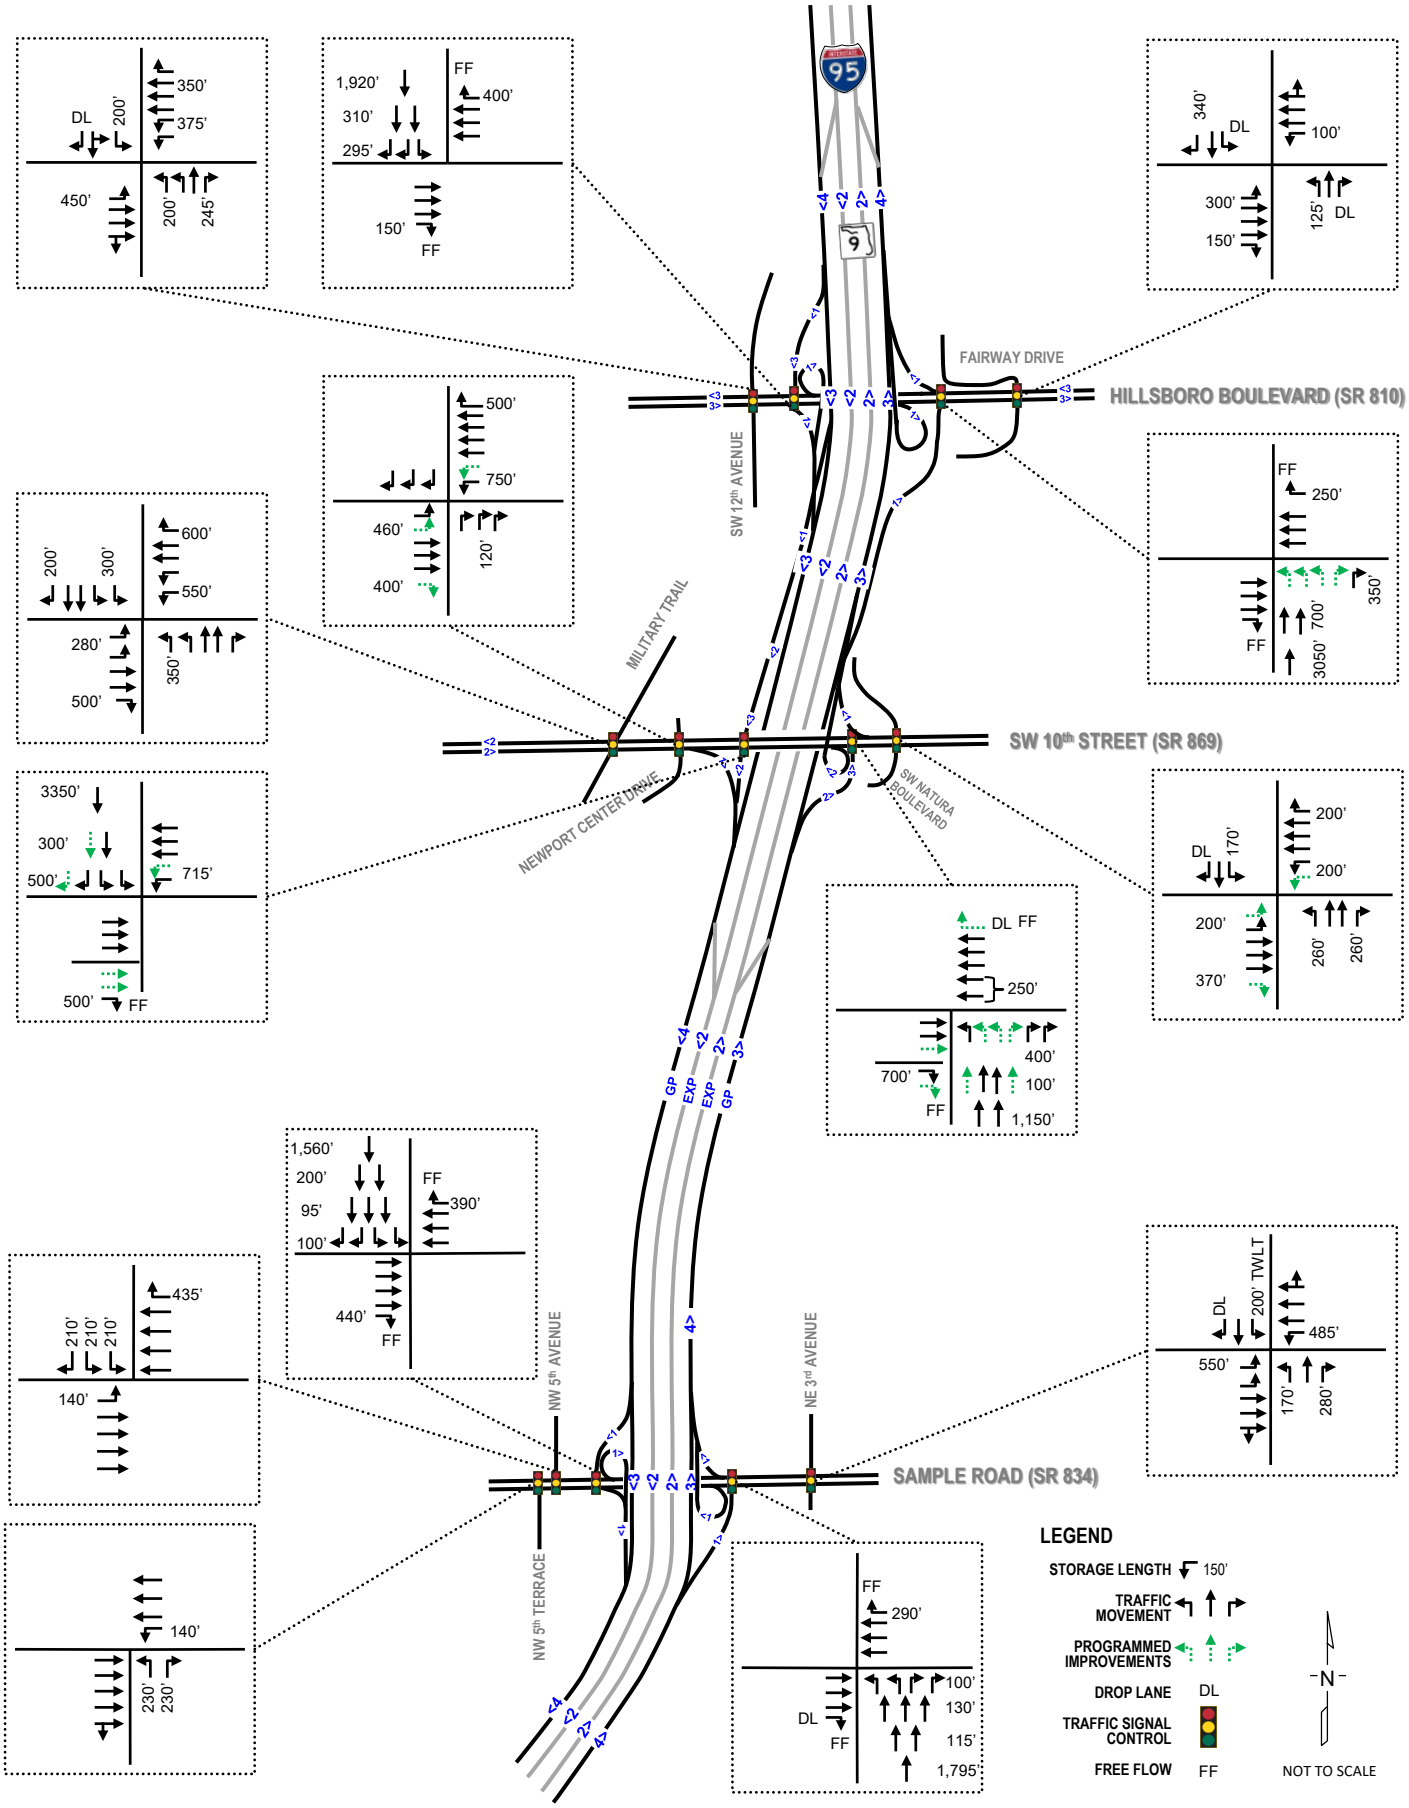

Figure 5.2: Build 2 & Build 3 - Roadway and Intersection Lane Configurations

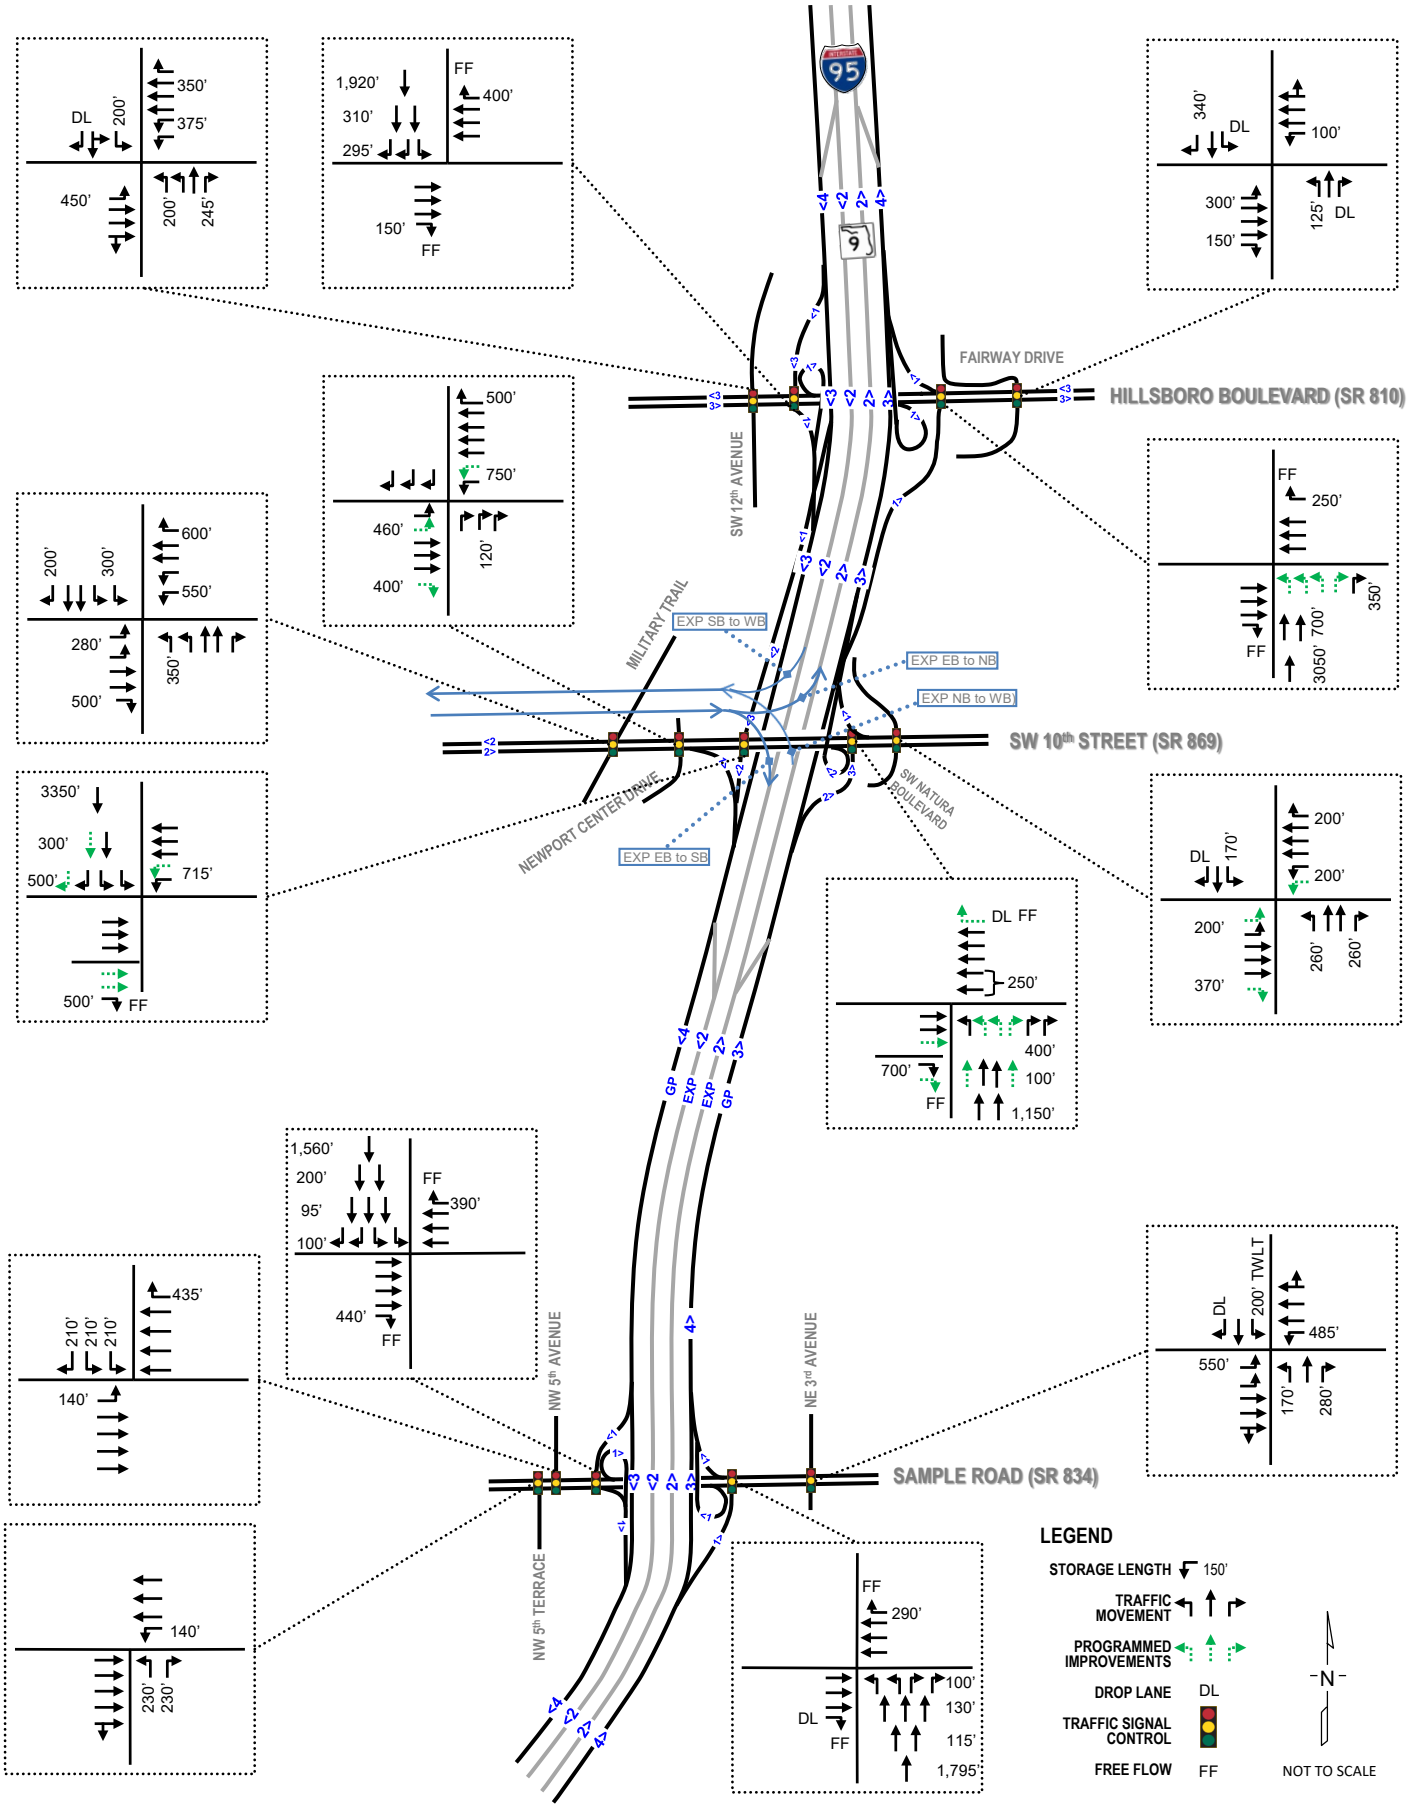

I-95 Improvements:

- I-95 NB and SB auxiliary lanes between Hillsboro Boulevard and Palmetto Park Road. (FPIDs 433108-6-52-01 and 433109-4-52-01)
- I-95 southbound auxiliary lane between SB entrance ramp from SW 10th Street and the SB exit ramp to Sample Road. This creates a 4-lane mainline segment on SB I-95. (FPID 433108-5-52-01)
- Eliminate the SB auxiliary lane between Hillsboro Boulevard and SW 10th Street. The proposed braided ramps in the southwest quadrant of interchange as discussed below eliminate the need for this auxiliary lane.

SW 10th Street Interchange Ramp Improvements:

- Provide a slip on-ramp for WB SW 10th Street to I-95 NB. Combine the EB to NB loop on-ramp from SW 10th Street with the new WB to NB slip on-ramp from SW 10th Street to create a single on-ramp merge on the mainline.
- Widen the EB to NB loop on-ramp to two lanes.
- Provide a braided NB off-ramp for Hillsboro Boulevard upstream of the NB on-ramp merge from SW 10th Street.
- Provide a two-lane NB off-ramp exit for SW 10th Street.
- Provide for 3 left-turn lanes and 3 right-turn lanes on the NB off-ramp approach.
- Provide for 2 left-turn lanes and 2 right-turn lanes on the SB off-ramp approach.
- Eliminate the existing WB to SB on-ramp signal on SW 10th Street by aligning it with the SB off-ramp signal. Widen the WB to SB on-ramp to two lanes.

Hillsboro Boulevard Interchange Ramp Improvements:

- Combine the WB to SB loop on-ramp from Hillsboro Boulevard with the EB to SB slip on-ramp from Hillsboro Boulevard to create a single on-ramp merge on the mainline.
- Provide a braided SB off-ramp for SW 10th Street upstream of the SB on-ramp merge from Hillsboro Boulevard.

SW 10th Street Intersection Improvements:

- At Newport Center Drive, eliminate the N-S left and through movements and provide for triple NB and triple SB right turn lanes. Provide dual EB and WB left turn lanes and an exclusive EB right turn lane.
- Provide barrier separated two EB through lanes for EB to NB I-95 traffic from east of Newport Center Drive to west of NB off-ramp intersection. Widen the loop on-ramp in the southeast quadrant to two lanes.
- At the SB ramp intersection, provide dual WB left turn lanes extending 250 feet east of the

NB ramp intersection.

- Widen the existing single free-flow southbound right turn lane to provide for signal controlled dual right-turn lanes to improve operations and safety in the westbound direction. The free-flow right turn movements are always a safety concern for the pedestrians in the cross-walk. Due to this safety concern, many municipalities and FDOT districts are not in favor of free-flow right turns. Also, due to the proximity of the signalized intersection at Newport Center Drive, the free-flow right turn induces weaving with the westbound traffic. This condition is likely to become worse with the introduction of the access to the westbound connector lanes immediately west of the Newport Center Drive.
- At Natura Boulevard, provide dual EB and WB left turn lanes and an exclusive EB right turn lane.

The 2020 and 2040 traffic volumes for the Build 1 Alternative are shown in **Figures 5.3** and **5.4**, respectively. The 2020 and 2040 traffic volumes for Build 2 Alternative are shown in **Figures 5.5** and **5.6**, respectively. The 2020 and 2040 traffic volumes for Build 3 Alternative are shown in **Figures 5.7** and **5.8**, respectively.

These improvements address the traffic operation deficiencies by improving or eliminating failing merge, diverge and weaving segments; and may reduce crash rates by reducing congestion. Improvements at the ramp terminal intersections are projected to eliminate queue spillbacks on to the I-95 mainline. In addition, pedestrian and bicycle mobility is maintained or enhanced through improved design.

THIS SPACE INTENTIONALLY LEFT BLANK

5.4 Build 1 Alternative – Traffic Operational Analysis

The proposed improvements are expected to provide better operating conditions than the No-Build conditions and prevent any spillbacks from the ramp terminals on to the mainline. These improvements are also likely to improve safety by reducing congestion and the number of conflict points.

5.4.1 2020 & 2040 – Freeway Analysis – I-95

The mainline/basic, weaving, and ramp merge/diverge analysis results for Opening Year 2020 are summarized and depicted on **Figures 5.9** and **5.10** for the NB and SB directions, respectively. The Design Year 2040 analysis results are summarized and depicted on **Figures 5.11** and **5.12** for the NB and SB directions, respectively. Documentation of the 2020 and 2040 Build 1 Alternative traffic freeway operational analysis is provided in **Appendix K**. The Design Year 2040 Build 1 Alternative analysis indicates that 7 of the 14 freeway segments in the NB direction are projected to operate at LOS E or F during one or both peak hours. In the SB direction, 3 of the 14 freeway segments are projected to operate at LOS E or F during one or both peak hours.

5.4.2 2020 & 2040 - Intersection Analysis

Tables 5.1 through **5.3** summarize the results of the 2020 Build 1 signalized intersection analyses for the AM and PM peak hours for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. **Tables 5.4** through **5.6** summarize the results of the 2040 Build 1 signalized intersection analyses for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. Signal timing was optimized for all intersections. The results include delays (in seconds per vehicle) and LOS by movement, approach, and the overall intersection. The volume to capacity (v/c) ratios and 95th percentile queue lengths have also been summarized by movement. **Appendix L** presents the intersection analysis worksheets. The intersection analysis results indicate the following for the 2040 Design Year:

- Hillsboro Boulevard: Two of the four signalized intersections are expected to operate at LOS E or worse during the AM or PM peak hours. The I-95 northbound and southbound off-ramp intersections are expected to operate at LOS C or better during both the AM and PM peak hours.
- SW 10th Street: Of the five signalized intersections, only the intersection at Military Trail is expected to operate at LOS F during both peak hours. The I-95 NB and SB off-ramp approaches are expected to operate at LOS E or worse during both peak hours.
- Sample Road: All five signalized intersections including the I-95 NB and SB off-ramp approaches are expected to operate at LOS D or better during both peak hours.

Synchro Version 9.2.914.6. HCM 2000 MOEs reported.

LOS notes:

Delay is in sec/veh units

:Level of service (LOS) E reflecting at capacity operations

:Level of service (LOS) F reflecting over capacity operations

Queue notes:

HCM methodology does not report queues, results are from Synchro report outputs

~: Volume exceeds capacity, queue is theoretically infinite

#: 95th percentile volume exceeds capacity

m: Upstream metering is in effect

Tables 5.7 summarizes the results of the off-ramp signals back of queue analyses for the AM and PM peak hours for 2020 and 2040 Build 1 conditions. HCM methodology does not provide queue lengths. The 95th percentile queues were obtained from Synchro reports. The Synchro reported queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length. The results present the queue length in feet for each lane group movement. The available storage length was calculated from the stop bar at the ramp terminal intersection to the gore with I-95 mainline, accounting for the changes in number of lanes. The analysis indicates that the queues on the off-ramps are not expected to exceed the available storage lengths and are not likely to affect the I-95 mainline operations.

Table 5.7: 2020 & 2040 Build 1 – Off-Ramp Signals Queuing Analysis Results

Intersection	Approach	Movement	Available Storage (ft)	Queue (ft)	
				AM	PM
2020 Build 1					
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	653	499
		R (WB)	1,860	788	375
Hillsboro Boulevard at I-95 NB Off-Ramp	Northbound	L (WB)	3,275	310	271
		R (EB)	2,925	426	#340

		R (WB)	1,320	243	#428
Sample Road at I-95 NB Off-Ramp	Northbound	L (WB)	1,405	241	807
		R (EB)	1,405	183	405
2040 Build 1					
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	719	733
		R (WB)	1,860	833	503
Hillsboro Boulevard at I-95 NB Off-Ramp	Northbound	L (WB)	3,275	341	333
		R (EB)	2,925	496	#422
SW 10th Street at I-95 SB Off-Ramp	Southbound	L (EB)	2,975	454	312
		R (WB)	2,975	#1,475	#1,856
SW 10th Street at I-95 NB Off-Ramp	Northbound	L (WB)	2,550	#1,184	#1,325
		R (EB)	2,550	620	#1,072
Sample Road at I-95 SB Off-Ramp	Southbound	L (EB)	1,320	246	277
		R (WB)	1,320	#333	#491
Sample Road at I-95 NB Off-Ramp	Northbound	L (WB)	1,405	277	1,013
		R (EB)	1,405	222	547

Queue Notes:

Synchro queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length.

#: 95th percentile volume exceeds capacity

Example of Storage Length Calculation for SBRT at Hillsboro Blvd. = [(1920/2) + 310+ (295*2)] = 1,860 feet.

5.5 Build 2 Alternative – Traffic Operational Analysis

The proposed improvements under Build 2 are similar to Build 1 and are expected to provide better operating conditions than the No-Build conditions. They are also likely to prevent any spillbacks from the ramp terminals on to the mainline and improve safety by reducing congestion and the number of conflict points.

5.5.1 2020 & 2040 – Freeway Analysis – I-95

The mainline/basic, weaving, and ramp merge/diverge analysis results for Opening Year 2020 are summarized on **Figures 5.13** and **5.14** for the NB and SB directions, respectively. **Figures 5.15** and **5.16** summarize the Design Year 2040 analysis results for NB and SB directions, respectively. Documentation of the Build 2 Alternative traffic freeway operational analysis is provided in **Appendix M**. The Design Year 2040 Build 2 Alternative analysis indicates that 5 of the 14 freeway segments in the NB direction are projected to operate at LOS E or F during one or both peak hours. In the SB direction, 2 of the 14 freeway segments are projected to operate at LOS E or F during one or both peak hours.

5.5.2 2020 & 2040 - Intersection Analysis

Tables 5.8 through **5.10** summarize the results of the 2020 Build 2 signalized intersection analyses for the AM and PM peak hours for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. **Tables 5.11** through **5.13** summarize the results of the 2040 Build 2 signalized intersection analyses for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. Signal timing was optimized for all intersections. The results include delays (in seconds per vehicle) and LOS by movement, approach, and the overall intersection. The volume to capacity (v/c) ratios and 95th percentile queue lengths have also been summarized by movement. **Appendix N** presents the intersection analysis worksheets. The intersection analysis results indicate the following for the 2040 Design Year:

- Hillsboro Boulevard: Two of the four signalized intersections are expected to operate at LOS E or worse during the AM or PM peak hours. The I-95 NB and SB off-ramp intersections are expected to operate at LOS D or better during both the AM and PM peak hours.
- SW 10th Street: Of the five signalized intersections, only the intersection at Military Trail is expected to operate at LOS F during both the AM and PM peak hours. The I-95 NB and SB off-ramp approaches are expected to operate at LOS E or worse during both peak hours.
- Sample Road: All five signalized intersections including the I-95 NB and SB off-ramp approaches are expected to operate at LOS D or better during both peak hours.

Synchro Version 9.2.914.6. HCM 2000 MOEs reported.

LOS notes:

Delay is in sec/veh units

:Level of service (LOS) E reflecting at capacity operations

:Level of service (LOS) F reflecting over capacity operations

Queue notes:

HCM methodology does not report queues, results are from Synchro report outputs

~: Volume exceeds capacity, queue is theoretically infinite

#: 95th percentile volume exceeds capacity

m: Upstream metering is in effect

Tables 5.14 summarizes the results of the off-ramp signals back of queue analyses for the AM and PM peak hours for 2020 and 2040 Build 2 conditions. HCM methodology does not provide queue lengths. The 95th percentile queues were obtained from Synchro reports. The Synchro reported queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length. The results present the queue length in feet for each lane group movement. The available storage length was calculated from the stop bar at the ramp terminal intersection to the gore with I-95 mainline, accounting for the changes in number of lanes. The analysis indicates that the queues on the off-ramps are not expected to exceed the available storage lengths and are not likely to affect the I-95 mainline operations.

Table 5.14: 2020 & 2040 Build 2 – Off-Ramp Signals Queuing Analysis Results

Intersection	Approach	Movement	Available Storage (ft)	Queue (ft)	
				AM	PM
2020 Build 2					
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	609	484
		R (WB)	1,860	739	364
Hillsboro Boulevard at I-95 NB Off-Ramp	Northbound	L (WB)	3,275	262	245
		R (EB)	2,925	405	#340
SW 10th Street at I-95 SB Off-Ramp	Southbound	L (EB)	2,975	324	233
		R (WB)	2,975	882	#745

		R (EB)	1,405	183	294
2040 Build 2					
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	693	693
		R (WB)	1,860	789	488
Hillsboro Boulevard at I-95 NB Off-Ramp	Northbound	L (WB)	3,275	276	274
		R (EB)	2,925	496	#422
SW 10th Street at I-95 SB Off-Ramp	Southbound	L (EB)	2,975	437	363
		R (WB)	2,975	#1,229	#993
SW 10th Street at I-95 NB Off-Ramp	Northbound	L (WB)	2,550	#1,168	#1,213
		R (EB)	2,550	577	#1,008
Sample Road at I-95 SB Off-Ramp	Southbound	L (EB)	1,320	239	264
		R (WB)	1,320	#320	#486
Sample Road at I-95 NB Off-Ramp	Northbound	L (WB)	1,405	277	995
		R (EB)	1,405	222	540

Queue Notes:

Synchro queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length.

#: 95th percentile volume exceeds capacity

Example of Storage Length Calculation for SBRT at Hillsboro Blvd. = [(1920/2) + 310+ (295*2)] = 1,860 feet.

5.6 Build 3 Alternative – Traffic Operational Analysis

The proposed improvements under Build 3 are similar to Build 1 and Build 2 and are expected to provide better operating conditions than the No-Build conditions. They are also likely to prevent any spillbacks from the ramp terminals on to the mainline and improve safety by reducing congestion and the number of conflict points.

5.6.1 2020 & 2040 – Freeway Analysis – I-95

The mainline/basic, weaving, and ramp merge/diverge analysis results for Opening Year 2020 are summarized on **Figures 5.17** and **5.18** for the NB and SB directions, respectively. **Figures 5.19** and **5.20** summarize the Design Year 2040 analysis results for NB and SB directions, respectively. Documentation of the Build 3 Alternative traffic freeway operational analysis is provided in **Appendix O**. The Design Year 2040 Build 3 Alternative analysis indicates that 3 of the 14 freeway segments in the NB direction are projected to operate at LOS E or F during one or both peak hours. In the SB direction, 2 of the 14 freeway segments are projected to operate at LOS E or F during one or both peak hours.

5.6.2 2020 & 2040 - Intersection Analysis

Tables 5.15 through **5.17** summarize the results of the 2020 Build 3 signalized intersection analyses for the AM and PM peak hours for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. **Tables 5.18** through **5.20** summarize the results of the 2040 Build 3 signalized intersection analyses for Hillsboro Boulevard, SW 10th Street, and Sample Road intersections, respectively. Signal timing was optimized for all intersections. The results include delays (in seconds per vehicle) and LOS by movement, approach, and the overall intersection. The volume to capacity (v/c) ratios and 95th percentile queue lengths have also been summarized by movement. **Appendix P** presents the intersection analysis worksheets. The intersection analysis results indicate the following for the 2040 Design Year:

- Hillsboro Boulevard: Two of the four signalized intersections are expected to operate at LOS E or worse during the AM or PM peak hours. The I-95 NB and SB off-ramp intersections are expected to operate at LOS D or better during both the AM and PM peak hours.
- SW 10th Street: All five signalized intersections are expected to operate at LOS D or better. The I-95 NB and SB off-ramp approaches are expected to operate at LOS E or worse during both peak hours.
- Sample Road: All five signalized intersections including the I-95 NB and SB off-ramp approaches are expected to operate at LOS D or better during both peak hours.

Synchro Version 9.2.914.6. HCM 2000 MOEs reported.

LOS notes:

Delay is in sec/veh units

:Level of service (LOS) E reflecting at capacity operations

:Level of service (LOS) F reflecting over capacity operations

Queue notes:

HCM methodology does not report queues, results are from Synchro report outputs

~: Volume exceeds capacity, queue is theoretically infinite

#: 95th percentile volume exceeds capacity

m: Upstream metering is in effect

Synchro Version 9.2.914.6. HCM 2000 MOEs reported.

LOS notes:

Delay is in sec/veh units

:Level of service (LOS) E reflecting at capacity operations

:Level of service (LOS) F reflecting over capacity operations

Queue notes:

HCM methodology does not report queues, results are from Synchro report outputs

~: Volume exceeds capacity, queue is theoretically infinite

#: 95th percentile volume exceeds capacity

m: Upstream metering is in effect

Table 5.19: 2040 Build 3 – SW 10th Street Intersection Analysis Results

Synchro Version 9.2.914.6. HCM 2000 MOEs reported.

LOS notes:

Delay is in sec/veh units

:Level of service (LOS) E reflecting at capacity operations

:Level of service (LOS) F reflecting over capacity operations

Queue notes:

HCM methodology does not report queues, results are from Synchro report outputs

~: Volume exceeds capacity, queue is theoretically infinite

#: 95th percentile volume exceeds capacity

m: Upstream metering is in effect

Tables 5.21 summarizes the results of the off-ramp signals back of queue analyses for the AM and PM peak hours for 2020 and 2040 Build 2 conditions. HCM methodology does not provide queue lengths. The 95th percentile queues were obtained from Synchro reports. The Synchro reported queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length. The results present the queue length in feet for each lane group movement. The available storage length was calculated from the stop bar at the ramp terminal intersection to the gore with I-95 mainline, accounting for the changes in number of lanes. The analysis indicates that the queues on the off-ramps are not expected to exceed the available storage lengths and are not likely to affect the I-95 mainline operations.

Table 5.21: 2020 & 2040 Build 3 – Off-Ramp Signals Queuing Analysis Results

Intersection	Approach	Movement	Available Storage (ft)	Queue (ft)	
				AM	PM
2020 Build 3					
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	583	486
		R (WB)	1,860	384	209
Hillsboro Boulevard at I-95 NB Off-Ramp	Northbound	L (WB)	3,275	84	84
		R (EB)	2,925	224	#193
SW 10th Street at I-95 SB Off-Ramp	Southbound	L (EB)	2,975	140	109
		R (WB)	2,975	#514	#436
SW 10th Street at I-95 NB Off-Ramp	Northbound	L (WB)	2,550	249	159
		R (EB)	2,550	190	288
Sample Road at I-95 SB Off-Ramp	Southbound	L (EB)	1,320	108	114

2040 Build 3					
Hillsboro Boulevard at I-95 SB Off-Ramp	Southbound	L (EB)	1,565	702	669
		R (WB)	1,860	454	256
Hillsboro Boulevard at I-95 NB Off-Ramp	Northbound	L (WB)	3,275	98	92
		R (EB)	2,925	292	#263
SW 10th Street at I-95 SB Off-Ramp	Southbound	L (EB)	2,975	197	151
		R (WB)	2,975	#868	#631
SW 10th Street at I-95 NB Off-Ramp	Northbound	L (WB)	2,550	#469	234
		R (EB)	2,550	253	#335
Sample Road at I-95 SB Off-Ramp	Southbound	L (EB)	1,320	128	137
		R (WB)	1,320	#185	#285
Sample Road at I-95 NB Off-Ramp	Northbound	L (WB)	1,405	144	522
		R (EB)	1,405	127	318

Queue Notes:

Synchro queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length.

#: 95th percentile volume exceeds capacity

Example of Storage Length Calculation for SBRT at Hillsboro Blvd. = [(1920/2) + 310+ (295*2)] = 1,860 feet.

5.6.3 VISSIM Analysis of 2040 No-Build and Build 3 Alternatives

Some of the Synchro analysis results did not appear to be reasonable probably because of its limitations pertaining to over-saturated traffic conditions, closely spaced intersections, unconventional intersection treatment, and free-flow right turn lane treatment. Synchro analysis failed to fully capture the operational benefits of the proposed improvements. For example, the analysis results for the southbound right turn movement from the I-95 southbound off-ramp to SW 10th Street, did not appear reasonable under the No-Build and Build conditions. Tables 4.5 and 5.19, presented earlier, provide a summary of the Synchro intersection analysis results for SW 10th Street for the 2040 No-Build and 2040 Build 3 alternatives, respectively. Table 4.5 shows that the free-flow southbound right turn movement from the I-95 southbound off-ramp will have a delay of less than 5 seconds per vehicle and practically zero queue length. With the heavy westbound traffic, weaving movements, and the proximity of the Newport Center Drive intersection, it is very unlikely that this movement will not experience any operational issues as indicated by the Synchro results. Similarly, Table 5.19 shows that the proposed signal controlled dual southbound right turn lanes will operate at LOS F despite the elimination of the signal for the westbound to I-95 southbound movement and the reconfiguration of the ramp terminal to physically separate the eastbound to I-95 northbound traffic from the eastbound through traffic. Therefore, in order to reasonably compare the No-Build and Build alternatives, additional traffic analysis such as traffic simulation was needed to make an informed decision. VISSIM traffic simulation analysis results for the SW 10th Street interchange were obtained from the ongoing SW 10th Street Connector PD&E Study. The traffic forecast and the Build alternative included in the SW 10th Street Connector PD&E Study are identical to the forecast and Build 3 alternative of the SIMR project.

Table 5.22 below shows a comparison of the Synchro and VISSIM analysis results for the SW 10th Street interchange ramp approaches and movements. It can be observed that Synchro analysis shows zero queue and LOS A for the free-flow southbound right turn movement under the 2040 No-Build conditions whereas VISSIM shows more than 80 seconds of delay and very long queue for the same movement. Similarly, under the 2040 Build 3 conditions, Synchro analysis shows LOS F for the signal controlled dual southbound right turn movement whereas VISSIM shows this movement to operate at LOS D. The reliability of the results from VISSIM analysis is much higher than the results from Synchro analysis. Therefore, it can be concluded that the I-95 ramps at SW 10th Street are expected to operate much better under the Build 3 conditions than under the No-Build conditions in 2040.

Table 5.22: 2040 Comparison of SYNCHRO and VISSIM Results
SW 10th Street Interchange Ramp Approaches

Intersection	Approach	Movt.	SYNCHRO MOEs				VISSIM MOEs (1)

(1) VISSIM MOEs obtained from the Project Traffic Analysis Report (PTAR) dated August 2019 for SR 869/SW 10th Street Connector PD&E Study.

Synchro Queue Notes:

All lengths are in feet.

Synchro queue was multiplied by the number of turn lanes and the lane utilization factor to calculate the total queue length.

#: 95th percentile volume exceeds capacity

Table 5.23 provides a comparison of the network-wide MOEs for the 2040 No-Build and Build 3 alternatives. These MOEs were obtained from VISSIM analysis documented in the PTAR dated August 2019 for the SW 10th Street Connector PD&E Study. The comparison clearly shows the Build 3 alternative to be better than the No-Build for all MOEs.

Table 5.23: 2040 Network-Wide Output (VISSIM)

*Benefits over 2040 No-Build Alternative using AM & PM Peak Period at 260 days.

5.7 Safety Analysis of the 2040 No-Build and Build Alternatives

5.7.1 HSM Analysis

As discussed earlier under Section 3.4, the crash data was obtained from FDOT Crash Analysis Reporting System (CARS) and summarized in Table 3.5. It was found that the percentages of the major crash types and the contributing factors were found to be very similar across the three interchanges. In order to assess the benefits of the proposed interchange and roadway design improvements as part of the three Build Alternatives, the theories and methods contained in Part C of the American Association of State and Highway Transportation Officials (AASHTO) Highway Safety Manual (HSM) were used. Part C of the HSM outlines procedures to estimate the frequency of crashes expected on a roadway based on geometric and traffic characteristics. The crash frequency is estimated based on predictive methods using Safety Performance Functions (SPFs) to determine base condition performance. Then Crash Modification Factors (CMFs) are applied to account for the unique characteristics of the site being analyzed. The Empirical Bayes (EB) Method is applied to determine the expected crash frequency for the "No-Build" condition. The EB Method combines the predicted average crash frequency, determined as part of the predictive method, and the observed crash frequency to determine the expected crash frequency. The addition of the observed crash frequency provides a more statistically reliable estimate of the expected average crash frequency. The HSM Arterial Spreadsheets and Excel file provided by FDOT for use on Freeways and Ramps were utilized to conduct this analysis. The limits of this analysis included:

- I-95 from south of Sample Road to north of Hillsboro Boulevard
  Including: Three freeway segments (including associated weaving sections), seven ramp terminals, nine merging segments, and seven diverging segments
- Sample Road from NW 5th Terrace to NE 3rd Avenue
  Including: Three arterial segments and three arterial intersections
- SW 10th Street from South Military Trail to Natura Boulevard
  Including: Five arterial segments and three arterial intersections
- Hillsboro Boulevard from SW 12th Avenue to Natura Boulevard
  Including: Three arterial segments and two arterial intersections

The primary modifications along the freeway segments include the addition of collector-distributor (C-D) roads at the SW 10th Street and Hillsboro Blvd Interchanges and the resultant reorganization of freeway entry and exit points, which contributed to changes in the predicted crash frequencies. Additionally, the ramp terminals at SW 10th street were re-designed. The HSM analysis for the No-Build and Build alternatives is summarized in **Table 5.24**. No changes

are proposed at the Sample Road Interchange; therefore, no Build condition analysis was conducted and the same crash frequency was assumed for the No-Build and Build conditions.

Table 5.24: 2040 No-Build and Build Alternatives – Summary of HSM Analysis

SW 10th Street HSM Analysis Summary					
Interchange	Site Type	No-Build Predicted Crash Frequency (crashes/year)	Build 1 Predicted Crash Frequency (crashes/year)	Build 2 Predicted Crash Frequency (crashes/year)	Build 3 Predicted Crash Frequency (crashes/year)
Sample Road	Freeway	129.72	129.72	129.72	129.72
	Arterial	38.95	38.95	38.95	38.95
SW 10th Street	Freeway	190.93	214.89	225.45	250.99
	Arterial	38.93	39.59	43.05	43.15
Hillsboro Blvd	Freeway	130.86	126.30	128.82	136.09
	Arterial	28.00	28.00	28.59	28.63
Total	Freeway	451.51	470.92	483.99	516.81
	Arterial	105.88	106.54	110.58	110.73
	All	**557.39**	**577.46**	**594.58**	**627.54**

The HSM analysis conducted is showing an increase in crashes from the No-Build to each of the Build conditions. The potential reasons for this increase are discussed in detail below. The complete summary tables for each location can be found in **Appendix Q**.

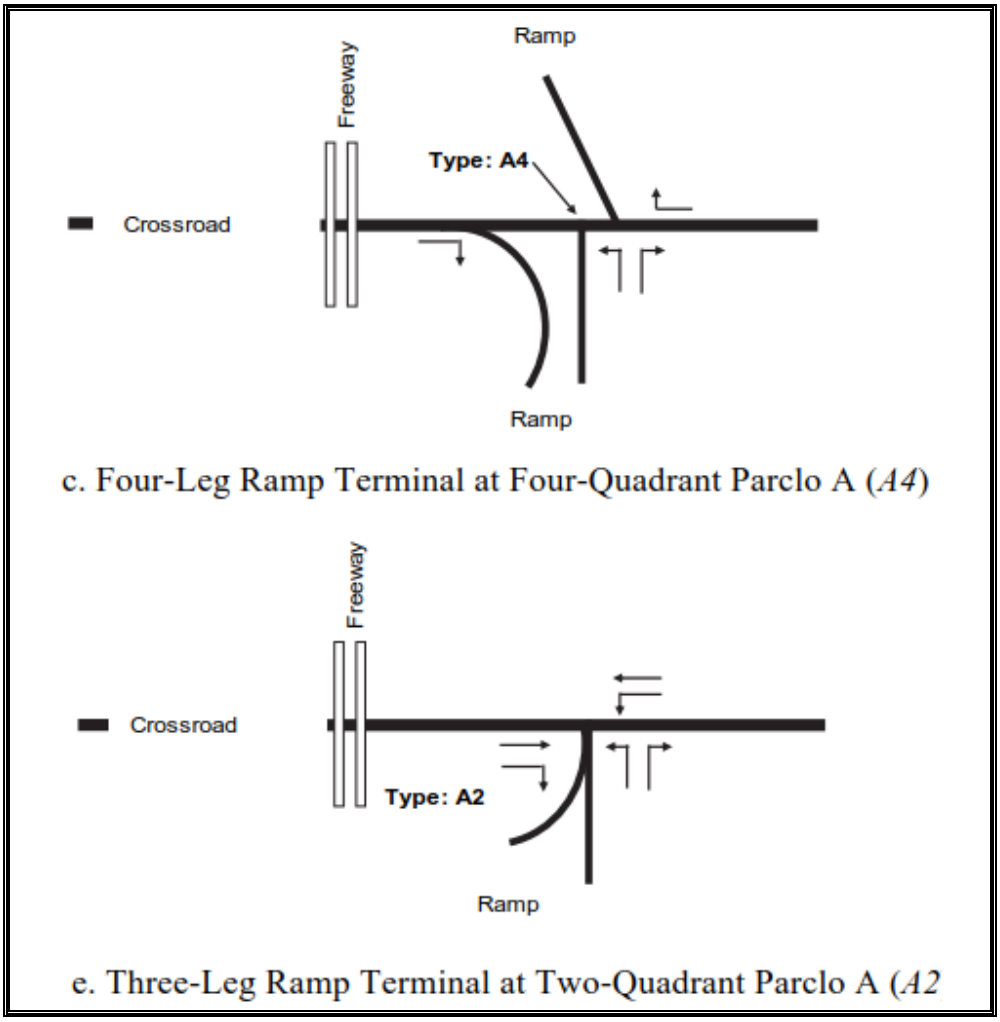
Based on the HSM analysis, the greatest benefit was seen through the Hillsboro Boulevard interchange. Within this interchange the predicted freeway crashes per year dropped from 131 under the No-Build conditions to 126 under the Build 1 conditions then increased to 129 and 136 crashes under the Build 2 and Build 3 conditions, respectively.

While the HSM predictive method is a very useful tool in assessing the safety impacts of new and modified roadways, there are still some limitations. These methods are relatively new and research is still being conducted to determine the safety impacts and predictive methods for some of the new and developing traffic management strategies and innovative roadway designs being produced at this time. One of the major factors that impacted the analysis, primarily in the vicinity of SW 10th Street, is the SPFs dependency on length and AADT. A good example of this is seen when comparing the freeway segments for the SW 10th Street No-Build and Build 1 conditions, where the AADT is the same and only the geometry changes. In the No-Build condition, SW 10th Street is a traditional interchange with merge and diverge points in both directions, resulting in an effective freeway length (total length minus merge and diverge areas) of 1.45 miles. However, in the Build conditions, these merge and diverge areas are relocated or eliminated through the use of C-D roads (braided ramps) and auxiliary lanes resulting in two freeway segments that have a total effective length of 1.88 miles. Due to the SPFs reliance on length and AADT, this increase in length results in 26 more crashes predicted in Build 1 vs. No-

Build. Therefore, even though from an operational standpoint, the re-organization of the merge and diverge points will most likely yield good results with increased safety, better average speeds and travel time reliability through the interchange, these benefits cannot be reflected in the HSM analysis.

Another major factor contributing to the increase in crashes at the SW 10th Street interchange based on HSM methodology is the increase in crashes at the NB exit ramp terminal. This ramp terminal is being re-designed from the existing "Three-leg at Two-Quadrant Parclo A" design to a "Four-leg at Four-Quadrant Parclo A" design as shown in **Figure 5.21**. Prior to the application of Crash Modification Factors (CMFs) this change in design shows a reduction in crashes, however, after the CMFs are applied, the values change and result in an increase in crashes for the Build 1 Condition. The HSM methodology fails to recognize the safety benefits of the conversion of the westbound left turn movement into a free-flow right turn movement.

Figure 5.21: SW 10th Street – I-95 NB Ramp Terminal Configuration – No-Build Vs. Build



The CMFs that have the biggest impact are the presence of turn lanes, protected only left-turn signal phasing and channelized right turns. When turn lanes or protected only left-turn phasing are presents a CMF of lower than 1 is applied, which reduces the predicted crash rate. When a channelized right-turn is present a CMF higher than 1 is applied, which increases the predicted crash rate. In the No-Build condition, at SW 10th Street, left-turn lanes with protected only signal phasing are present for the westbound approach (entering the loop ramp to northbound I-95) and a channelized right-turn is present on the eastbound approach (entering the loop ramp to northbound I-95). However in the Build condition this westbound left-turn movement is eliminated and replaced by an exclusive westbound to northbound ramp with a channelized right-turn entry. Based on the geometric and signal related features for the No-build condition the final CMFs are 0.55 for fatal crashes and 0.68 for Property Damage Only crashes, whereas the final CMFs for the Build Condition are 1.21 for fatal and property damage only crashes. As with the freeway segment, the potential operational benefits of eliminating the westbound left-turn movement in the Build condition are not able to be reflected by the HSM analysis and are actually being negatively represented by an increase in predicted crashes. Some of the other limitations that may have impacted this analysis include innovative arterial intersection designs, no analysis for six-lane arterial segments, and Express Lanes.

The arterial intersections' SPFs are based on classic three and four leg intersection design and as such the innovative design being proposed at SW 10th Street and Newport Center Drive cannot be accurately reflected. The proposed design eliminates the northbound and southbound left-turn and through movements and redirects them to a loop road that connects the north and south sides of Newport Center Drive. While we know that both safety and operational impacts should be seen by eliminating these movements there is currently no way to reflect the elimination of a major movement in the HSM analysis. Additional research was conducted to see if any CMFs exist to account for this change, however, nothing could be found. When individual sites along SW 10th Street are looked at, most sites show either the same or a lower crash frequency for the Build condition vs. the No-Build condition. The only areas that show an increase in crashes are the sites in the vicinity of Newport Center Drive where the AADT increased in the Build condition, but the intersection geometry/configuration could not be accurately reflected.

All three of the arterials being analyzed are six-lane divided arterials. However, the HSM only includes SPFs for four-lane divided arterials. When conducting this analysis all arterials were shown as four-lane divided arterials and then an additional Crash Modification Factor (CMF) was applied to account for the six-lane condition. The CMF used was determined via the CMF Clearing House website, details of this CMF can be found in Appendix Q.

5.7.2 Traditional Crash Reduction Analysis

As discussed above, the limitations in the HSM methodology could not quantify the safety benefits of the proposed improvements under the Build conditions. Therefore, in consultation with FDOT and District 4 Safety staff, it was determined that a traditional crash reduction analysis will need to be conducted to determine the safety benefits of the proposed improvements.

In order to estimate the potential safety benefits associated with proposed freeway, interchange, and arterial improvements, the crash reduction analysis utilized the following steps:

1. Identifying applicable crash reduction factors (CRF)
2. Identifying potentially correctable crashes for each improvement with an applicable CRF
3. Applying the CRFs to potentially correctable crashes to estimate the crash reduction per year.

This analysis was conducted based on historic crash data for the years 2012 to 2016. Life cycle analysis, which takes into account the project life in years and capital recovery factor, was not included in this analysis.

The following available resources in the order listed, were used to determine the applicable CRFs:

- FHWA Desktop Reference for Crash Reduction Factors
- FDOT approved Technical Report "Update of Florida Crash Reduction Factors and Countermeasures to improve the Development of District Safety Improvement Projects"
- CMFClearinghouse.org website
- Literature Review for any recent studies that may provide applicable CRFs

Based on the available CRF data, applicable CRFs were identified for the following nine of the proposed improvements under the Build alternatives:

1. I-95 NB auxiliary lanes between Hillsboro Boulevard and Palmetto Park Road.
2. I-95 SB auxiliary lanes between Hillsboro Boulevard and Palmetto Park Road.
3. I-95 SB auxiliary lane between SW 10th Street and Sample Road.
4. Widen the EB to NB loop on-ramp from SW 10th Street to two lanes.
5. Widen NB off-ramp to SW 10th Street from one lane to two lanes.
6. Provide two right-turn lanes on the SB off-ramp to SW 10th Street.
7. Convert SW 10th Street/Newport Center Drive intersection from conventional intersection to RCUT Style intersection.

8. Provide an additional WB left-turn lane at the SW 10th Street and SB entry/exit ramp intersection.
9. Provide dual EB and WB left turn lanes and an exclusive EB right turn lane at the SW 10th Street/Natura Blvd Intersection

It is important to note that appropriate CRFs are not available for many of the proposed improvements under the Build alternatives. These improvements are very likely to improve the operations and consequently the safety, the benefits of which cannot be quantified due to the lack of available data. Some of the improvements for which no appropriate CRFs could be obtained are:

1. Removal of the traffic signal for the WB to SB movement at the SW 10th Street interchange. This signal is being combined with the SB off-ramp signal.
2. Elimination of the weaving between the EB Hillsboro Boulevard to I-95 NB loop ramp and the NB I-95 to WB Hillsboro Boulevard loop ramp.
3. Elimination (through braided ramps) of the conflict between the NB On-ramp from SW 10th Street and NB Off-Ramp to Hillsboro Boulevard.
4. Elimination (through braided ramps) of the conflict between the SB On-ramp from Hillsboro Boulevard and the SB Off-Ramp to SW 10th Street.
5. Elimination of the WB to SB I-95 loop ramp merge with I-95 mainline lanes at Hillsboro Boulevard
6. Increasing the storage length of the NB Off-Ramp to Hillsboro Boulevard from 2450’ to 4100’ to prevent queue spillback onto I-95 mainline.
7. Increasing the storage length of the SB Off-Ramp to SW 10th Street from 1360’ to 4150’ to prevent queue spillback onto I-95 mainline.

The 2012 to 2016 crash data related to the nine improvements for which CRFs were available was obtained and a high-level review was conducted to determine those crashes that may be correctable as a result of each of the nine improvements. Crash data for all but one of the improvements was obtained from the FDOT Crash Analysis Reporting System (CARS). SW 10th Street is not a State Road east of the NB I-95 on/off ramp intersection. As such, the crash data for the SW 10th Street/Natura Boulevard intersection had to be obtained from Signal Four Analytics. The crash data was filtered to include only those crashes that would be applicable to the associated improvements. For example, only the crashes that occurred in the southbound direction were used in the analysis for the SB auxiliary lane improvements. All pertinent data is included in **Appendix Q**. The results of this analysis are summarized in **Table 5.25**. The analysis results show that approximately 43 crashes per year may be reduced by the proposed improvements resulting in an annual safety benefit of $6,358,987. The safety benefit per year was calculated based on the average cost per crash provided in the FDOT Design Manual which is based on the 2012 to 2016 crash data.

Table 5.25: Crash Reduction Analysis Summary

#	Improvement	BMP	EMP	CRF[1]	Source	Potentially Correctable Crashes[2] (2012-2016)	Estimated Crash Reduction (per year)	Cost per crash[3]	Estimated Safety Benefit (per year)
1	I-95 NB auxiliary lanes between Hillsboro Boulevard and Palmetto Park Road.	25.013/0.000	25.334/1.354	21%	CMF Clearing House	227	9.534	$153,130	$1,459,941.42
2	I-95 SB auxiliary lanes between Hillsboro Boulevard and Palmetto Park Road.	25.334/1.337	24.980/0.000	21%	CMF Clearing House	278	11.676	$153,130	$1,787,945.88
3	I-95 SB auxiliary lane between SW 10th Street and Sample Road.	23.526	21.983	21%	CMF Clearing House	201	8.442	$153,130	$1,292,723.46
4	Widen the EB to NB loop on-ramp from SW 10th Street to two lanes.	-	-	25%	FDOT Report	26	1.3	$153,130	$199,069.00
5	Widen NB off-ramp to SW 10th Street from one lane to two lanes	-	-	25%	FDOT Report	57	2.85	$153,130	$436,420.50
6	Provide two right-turn lanes on the SB off-ramp to SW 10th Street	-	-	17%	FDOT Report	52	1.768	$153,130	$270,733.84
7	Convert SW 10th Street/Newport Center Drive intersection from conventional intersection to RCUT Style intersection	1.774	1.874	15%	FHWA-HRT-17-082	86	2.58	$123,598	$318,882.84
8	Provide an additional WB left-turn lane at the SW 10th Street and SB entry/exit ramp intersection	1.955	2.135	17%	FDOT Report	44	1.496	$123,598	$184,902.61
9	Provide dual EB and WB left turn lanes and an exclusive EB right turn lane at the SW 10th Street/Natura Blvd Intersection[4]	n/a	n/a	28%	FDOT Report	59	3.304	$123,598	$408,367.79
						Total	**42.95**		**$6,358,987.34**

1. See appendix Q for CRF Reference Information
2. See Appendix Q for Crash Data
3. Cost per crash based on FDOT Design Manual Section 122.6.1 Table 122.6.1
4. This portion of SW 10th Street is not part of the SHS, crash data was obtained from Signal Four Anlaytics

6 OTHER CONSIDERATIONS

6.1 Potential Design Exceptions and Variations

Improvements along the I-95 mainline and ramps will require a border width variation, as there are several locations where the 94' minimum width cannot be achieved without further right-of-way acquisition, and a horizontal alignment variation due to several curves that do not meet the minimum curve length of 400'. Improvements along SW 10th Street may require a border width variation from the I-95 interchange to Military Trail where the minimum 8' cannot be established, a median width variation at several locations where the minimum 15.5' width is not provided, and a shoulder width variation for each direct connect bridge over I-95 and SW 10th Street connecting managed lanes and express lanes. All other improvements along the mainline, ramps, SW 10th Street and Hillsboro Boulevard should be designed using minimum standards established in the latest editions of AASHTO's A Policy on Geometric Design of Highways and Streets and the FDOT Design Manual.

7 PROJECT JUSTIFICATION

7.1 FHWA's Policy on Access to the Interstate System

The Federal Highway Administration's (FHWA's) newly adopted policy on *Access to the Interstate System* became effective on May 22, 2017 and replaces the policy of August 27, 2009 on *Access to the Interstate System*, published at 74 Federal Register 43743. The changes in this policy are made to ensure this policy focuses on safety, operational, and engineering issues. The consideration of social, economic, and environmental impacts discussed in the 2009 policy are removed from this policy. However, the removal from this policy does not eliminate the need to consider those matters. Those issues will be addressed under the National Environmental Policy Act and other statutes and regulations applicable to the approval process.

This policy is effective as of May 22, 2017.

It is in the national interest to preserve and enhance the Interstate System to meet the needs of the 21st Century by assuring that it provides the highest level of service in terms of safety and mobility. Full control of access along the Interstate mainline and ramps, along with control of access on the crossroad at interchanges, is critical to providing such service. Therefore, the Federal Highway Administration's (FHWA) decision to approve new or revised access points to the Interstate System under Title 23, United States Code (U.S.C.), Section 111, must be supported by substantiated information justifying and documenting that decision. The FHWA's decision to approve a request is dependent on the proposal satisfying and documenting the following requirements:

Considerations and Requirements

1. *An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate facility (which includes mainline lanes, existing, new, or modified ramps, and ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (Title 23, Code of Federal Regulations (CFR), paragraphs 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic*

on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

The operational analysis conducted for the SIMR confirmed that the proposed interchange modifications are not expected to have any significant adverse impacts on safety and operations on the interstate facility (I-95). The proposed improvements along Hillsboro Boulevard and SW 10th Street under the Build alternatives are expected to significantly improve the operations at the NB and SB off-ramp terminal intersections. The 2040 No-Build queuing results for the NB off-ramp at SW 10th Street show the queues to be approaching the available storage lengths which could adversely impact the flow of traffic along I-95. The proposed improvements under the 2040 Build conditions are projected to significantly increase the available storage length for this ramp and should prevent the queue from adversely affecting the operations along I-95. The comparison between No-Build and Build Alternative 3 shows that annual travel time saving is approximately $ 119 million. Build Alternative 3 is projected to significantly reduce delays during AM and PM peak hours. The projected failing conditions under the No-Build Alternative are expected to increase future crash risk within the project corridor. This potential for increased crash risk is alleviated by the capacity improvements proposed in the Build Alternatives.

Many of the improvements proposed for this project are unconventional and unique. The limitations in the Highway Safety Manual (HSM) analysis methodology fail to capture the benefits of the proposed operational and capacity improvements proposed under the Build alternatives and consequently fail to quantify the crash reduction in a meaningful way for this project. Therefore, a traditional crash reduction analysis was conducted to estimate the potential safety benefits of the proposed freeway, interchange, and arterial improvements. The analysis shows that the proposed improvements are likely to reduce approximately 43 crashes per year resulting in an annual safety benefit of more than six (6) million dollars.

2. *The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit or high occupancy vehicle and high occupancy toll lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.*

This SIMR does not propose any new interchanges along I-95. These existing interchanges provide access to public roads only. The improvements proposed at the interchanges will maintain full access to the existing cross streets and accommodate all movements.

THIS SPACE INTENTIONALLY LEFT BLANK

8 CONCEPTUAL FUNDING

A funding plan for the proposed project has been developed and the right of way phase has been programmed. The interchange improvements will be constructed as part of a Design/Build project under FM number 436964-2 as follows:

- Design/Build Advertisement – April 2024
- Contract Execution – December 2024
- Open to Traffic – July 2027

Funding has been identified in the Work Program for the preliminary design, right of way, utility and design build phases in FY 2019 through FY 2024. The total estimated construction cost is $286 million. Cost estimates have been developed based on an engineer's opinion of probable cost using current FDOT Long Range Estimates (LRE) base costs.

THIS SPACE INTENTIONALLY LEFT BLANK

9 CONCLUSION AND RECOMMENDATION

The primary purpose of the I-95 Systems Interchange Modification Report (SIMR) project is to identify the long-term needs through 2040 and to develop design concepts to address traffic spillbacks onto I-95, improve interchange operations, reduce congestion, and enhance safety at the I-95 interchange at SW 10th Street (SR 869) and adjacent interchanges at Hillsboro Boulevard (SR 810) and Sample Road (SR 834). This SIMR evaluates the traffic operations of the No-Build, Build 1 and Build 2 alternatives.

The information and analysis indicate that several of the merge, diverge and weaving areas have been designated as High Crash Locations at some point within the last three years of analysis (2013-2015). Similarly, the No-Build Alternative is projected to experience operational failures at multiple merge, diverge and weave locations along I-95 within the study interchanges. Proposed modifications to the interchange are recommended to address projected deficiencies in the future. Listed below are specific modifications and projected benefits:

- The proposed Build alternatives with a 7,900 foot SB auxiliary lane on I-95 between the SB entrance ramp from SW 10th Street and the SB exit ramp to Sample Road creates a 4-lane mainline segment on SB I-95 and is projected to significantly improve the operations in the SB direction.
- The proposed NB braided ramps at the SW 10th Street interchange and the SB braided ramps at Hillsboro Boulevard not only reduce the number of merge and diverge points along I-95 but also provides for longer off-ramp storage lengths. Freeway analysis projects significant improvements over the No-Build conditions in the merge, diverge and mainline operations in both directions.
- The interchange ramp terminal improvements proposed under the Build alternatives are projected to significantly improve the operations at the ramp terminals and potentially eliminate the possibility of off-ramp queues spilling on to the mainline.
- The proposed elimination of the SB on-ramp signal at SW 10th Street and the proposed improvements along SW 10th Street are expected to significantly improve the flow of traffic along the arterial, particularly at the interchange. The improved operations are projected to improve the safety along the corridor.
- The intersection of SW 10th Street and Newport Center Drive is located less than 900 feet west of the SB off-ramp terminal and the westbound queues affect the ramp operations. In order to provide more green time for the east-west movements at this intersection, the northbound and southbound approaches have been modified to allow only right turn movements. Triple right turn lanes have been provided on the northbound and southbound approaches. The northbound and southbound through and left turn

movements have been reassigned based on their destination to SW 12th Avenue/Newport Center Drive local road.

These improvements address the traffic operation deficiencies by eliminating or improving the failing conditions within the interchange influence area and improving safety by reducing congestion and improving operating conditions along SW 10th Street and Hillsboro Boulevard. A traditional crash reduction analysis shows that the proposed improvements are likely to reduce approximately 43 crashes per year resulting in an annual safety benefit of more than six (6) million dollars.

Table 9.1 provides a comparison of the Design Year 2040 intersection analysis results. It is evident from this summary table that the Build alternatives are projected to provide better operating conditions than the No-Build in Design Year 2040. Among the Build alternatives, Build 2 appears to provide better MOEs than Build 1 and Build 3 has slightly better MOEs than Build 2. It is important to note that the traffic demand through the roadway network is the highest under Build 3 due to the system-to-system connection between Sawgrass Expressway in the west and I-95 in the east.

Table 9.2 provides a comparison of the off-ramp queuing analysis results for Design Year 2040. The analysis indicates that under the Build alternatives, it is highly unlikely for the off-ramp queues to exceed the available storage lengths. It is also important to note that the Build queues are shorter than the No-Build queues in most instances.

Considering the overall operations along I-95, ramp terminals, and along Hillsboro Boulevard and SW 10th Street, all three Build alternatives are projected to provide better operating conditions than the No-Build. However, the operational improvements under the Build 3 alternative are better than Build 1 and Build 2 despite the highest traffic demand under Build 3. In terms of Strategic Intermodal System (SIS) connectivity, Build 3 provides better connectivity. Build 3 provides a direct and logical system-to-system connection between Sawgrass Expressway and I-95 and Florida's Turnpike. VISSIM analysis of the No-Build and Build 3 alternatives confirms that the Build 3 alternative is expected to provide better operations than the No-Build alternative in 2040.

Fort Lauderdale, FL 33309
May 4, 2017

SUBJECT: Interstate 95 and SW 10th Street (S.R. 869) Interchange Modification Report Amendment to the Methodology Letter of Understanding (MLOU)

Dear Mr. Martinez:

The purpose of this letter is to request an Administrative Amendment to the Methodology Letter of Understanding (MLOU) for the **Interstate 95 (I-95)** and **SW 10th Street (S.R. 869)** Interchange Access Request. A copy of the signed MLOU is provided in **Appendix A**. This amendment is requested to document changes in the traffic K factor values. The changes are recommended due FDOT policy changes and information related to project area historical AADT growth and recently collected existing characteristics.

The recommended modifications to the MLOU are outlined as follows:

5.0 Travel Demand Forecasting

E. Traffic Factors

(Update with the following)

- Utilizing recommended ranges identified in the Project Traffic Forecasting Handbook and Procedure (525-030-120).
- Utilizing other factors, identified below

Description:

The directional design hour volumes (DDHV) development process for the I-95 IMR will involve the application of the standard procedure of adjusting the average annual daily traffic (AADT) volumes with the Standard K and D_{30} traffic factors. However, it will be adjusted to produce AM and PM peak hour volumes along the different corridors as follows:

- Standard K will be applied to the highest peak hour period between AM or PM; the other period K factor will be determined as a ratio based on existing counts.
- I-95 mainline Standard K = 7.0% is proposed
- Standard K = 8.0 will be applied to I-95 ramps and along the crossing corridors between the I-95 Ramps. Other K factors will be based on existing and historical counts. D factors will be calculated by link for each

peak period based on existing and historical data.

As outlined in the Project Traffic Forecasting Handbook, FDOT has replaced the previous K30 factor development with Standard K factors based on research of Florida roadway characteristics and a recognized inability to continue to cost effectively design urban roadway based on the 30th highest hour demand volumes. Such is the case with I-95 within the study area, Standard K factors have been established statewide by using the data measured at the continuous count sites, and it is expected that future K values (Standard K) will be lower than existing field measured K values.

The current identified value for Standard K on I-95 mainline is 8%, however recently collected traffic data within the project area has demonstrated a lower value is appropriate. Applying a Standard K factor of 8% produces a design hour trend or DDHVs which significantly exceed historical growth trends.

Exhibit 1 shows that the historical AADT growth is <1%. Traffic volumes from the telemetered traffic monitoring site (TTMS) #0163 on I-95 just north of 48th Street in Pompano Beach (just south of SW 10th Street) were used to calculate the growth rate. The volumes show a flat growth rate over the last 15 years. The chart below shows the historical AADT volumes for I-95, with a 2015 AADT of 204,200.

Exhibit 1 - I-95 Historical AADT Volumes

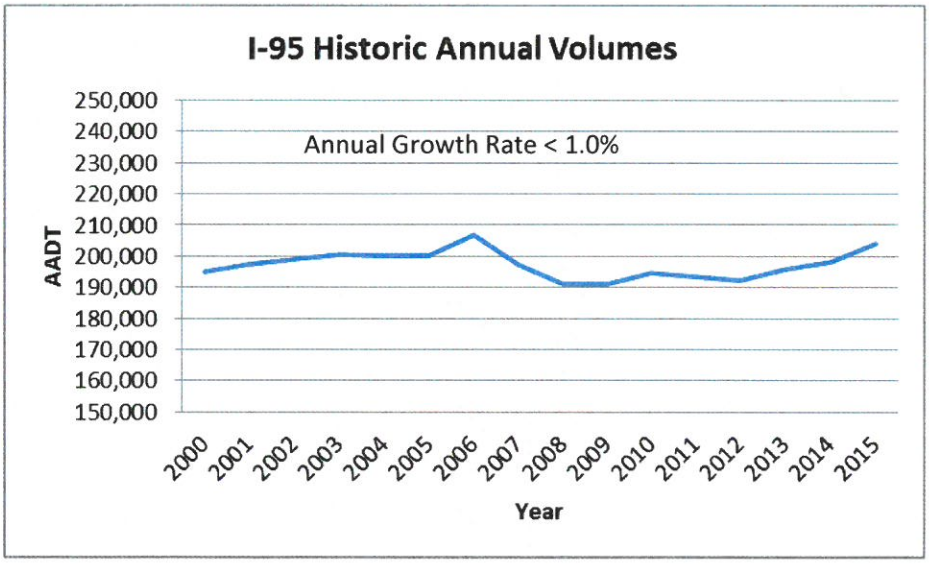

Exhibit 2 shows existing values for K and D factors. The values for K factor for I-95 mainline lanes currently range between 6.4% and 6.7%. The existing ramp K values are between 6.3% and 8.4%.

Exhibit 2 - I-95 Existing Data

I-95 Interchange	Profile	Existing 2016 (PTFM)				
		2016 AADT	AM Peak Hr Vol		PM Peak Hr Vol	
			SB AM	NB AM	SB PM	NB PM
		207,800	**6,020**	**7,880**	**6,850**	**6,720**
SR 810 - Hillsboro Blvd		27,500	1,150	1,170	1,000	1,170
		32,800	1,300	1,150	1,420	1,140
		213,100	**6,170**	**7,860**	**7,270**	**6,690**
SR 869 - SW 10th St		31,500	910	1,360	960	1,090
		30,300	1,180	990	1,170	1,220
		211,900	**6,440**	**7,490**	**7,480**	**6,820**
SR 834 - Sample Rd		27,100	790	1,190	990	900
		37,800	1,660	710	1,320	1,480
		222,600	**7,310**	**7,010**	**7,810**	**7,400**

I-95 Interchange	Profile	2016 Observed K and D Values				
		2016 AADT	AM Peak Hr Vol		PM Peak Hr Vol	
			K	D	K	D
		207,800	**6.7%**	**56.7%**	**6.5%**	**50.5%**
SR 810 - Hillsboro Blvd		27,500	8.4%	50.4%	7.9%	53.9%
		32,800	7.5%	53.1%	7.8%	55.5%
		213,100	**6.6%**	**56.0%**	**6.6%**	**52.1%**
SR 869 - SW 10th St		31,500	7.2%	59.9%	6.5%	53.2%
		30,300	7.2%	54.4%	7.9%	51.0%
		211,900	**6.6%**	**53.8%**	**6.7%**	**52.3%**
SR 834 - Sample Rd		27,100	7.3%	60.1%	7.0%	52.4%
		37,800	6.3%	70.0%	7.4%	52.9%
		222,600	**6.4%**	**51.0%**	**6.8%**	**51.3%**

Exhibit 3 shows that the projected DDHV using a K factor of 8% yields a growth rate greater than 1%, which contradicts AADT historical trend and project specific growth of 0.5% per year. However, the projected DDHVs using a K factor of 7% yields a growth rate less than 1%.

- 24T and DHT_f will be calculated for each intersection or link based on existing and historical data. A minimum DHT_f factor of 2.0% will be used.
- PHF for Existing Year Analysis will be based on existing counts.
- PHF for Future Year Analyses: PHF=0.95 for I-95 Mainline and Ramp movements; PHF=0.92 for cross streets; If Adaptive Signal Control is provided, then PHF=1.00.
- TMTool, rounding and balancing will be conducted; therefore, the final K and D may not match the initial values.

The proposed revision to the traffic factors for the project are outlined below:

Roadway	K	D	24T	DHT_f	PHF
I-95 Mainline	7.0	50.5 to 56.7	4.0 to 6.0	2.0 to 3.0	0.85 to 0.99
I-95 Ramps	8.0	100	4.0 to 6.0	2.0 to 3.0	0.85 to 0.99
SW 10th Street	5.7 to 12.8	50.0 to 83.4	3.0 to 8.0	2.0 to 3.0	0.93 to 0.97
Hillsboro Boulevard	6.3 to 9.0	50.0 to 93.3	3.0 to 9.0	2.0	0.94 to 0.96
Sample Road	3.9 to 9.5	50.7 to 71.2	3.0 to 7.0	2.0 to 3.0	0.92 to 0.96

Source: AECOM preliminary calculations based on existing and historical volume data. A minimum DHT_f factor of 2.0% will be used. DHT_f factors for the Publix Distribution Center along SW 10th Street will be significantly higher within the immediate area.

Please sign the appropriate signature block to show your concurrence with the proposed Administrative Amendment #1 to the approved Methodology Letter of Understanding (MLOU) signed on January 2017. Thank you in advance for your consideration and processing of this request.

Sincerely,

Pramod Choudhary, PE, PTOE
Transportation Engineering Manager

Methodology Letter of Understanding (MLOU)

METHODOLOGY LETTER OF UNDERSTANDING - ADMINISTRATIVE AMENDMENT #1

Interstate 95 and SW 10th Street (S.R. 869)
Interchange Modification Report

Financial Project No: 436964-1-22-02

The undersigned approve and concur to amend the approved Methodology Letter of Understanding (MLOU) as stated in the letter dated May 3, 2017. All other methodology and procedures set forth in the MLOU remain unchanged and in force.

Requestor	Humberto Arrieta *FDOT District 4*	5/22/17 *Date*
Interchange Review Coordinator	Scott Peterson *Project Development Manager*	5/22/17 *Date*
State Interchange Review Coordinator	Andrew Young *Systems Planning Office – Central Office*	6/2/17 *Date*

Appendix A

I-95 and SW 10th Street (SR 869) Interchange Modification Report MLOU

1.0 Project Description

Provide background or supporting information that explains the basis for the request.

A. *Purpose and Need Statement*

Provide the Purpose, the Need, and the Goals and Objectives.

This document serves as the Methodology Letter of Understanding (MLOU) between the Requester, the Florida Department of Transportation (FDOT) Central Office, and FDOT District Four for preparing an Interchange Modification Report (IMR) for the Interstate 95 (I-95) / State Road (SR) 9 and SW 10th Street / SR 869 Interchange in Broward County, Florida.

The primary purpose of this IMR is to identify the long-term needs through the year 2040 and to develop design concepts to address traffic spillbacks onto I-95, improve interchange operations, reduce congestion, and enhance safety at the study interchange at SW 10th Street (SR 869) and adjacent interchanges at Hillsboro Boulevard (SR 810) and Sample Road. FDOT District 4 has conducted an Interchange Master Plan (IMP) for I-95 interchanges within Broward County. This IMR relates to the proposed improvements associated with the IMP study. This MLOU outlines criteria, assumptions, processes and documentation requirements for this project.

A primary need of this IMR is to update geometric improvements that were based on prior design standards and historical design traffic projections. Increasing traffic spillbacks onto the I-95 mainline from the off-ramps, safety concerns at high crash locations, delay caused by congestion and inefficient traffic signal timings at I-95 ramp terminals will be addressed. The IMR must be compatible with the proposed I-95 Express Lanes. The goal is to define, prioritize and program necessary interchange projects.

B. *Project Location*

Provide project description and a map of the IAR project location.

The project area includes I-95 (SR 9), from south of Sample Road (SR 834) Interchange (MP 21.601) to north of Hillsboro Boulevard (SR 810) interchange (MP 24.641), in Broward County, Florida. **Figure 1** provides a Project Location and **Figure 2** summarizes the interchange spacing within the IMR limits.

Exhibit / Figure # - Figure 1 and Figure 2 attached ☒

C. *Area of Influence*

Provide a description of the area of influence along the main line and cross street.

Along mainline:

I-95 (SR 9), from south of Sample Road (SR 834) to north of Hillsboro Boulevard (SR 810), including ingress/egress ramps from/to I-95 Express Lanes.

Along crossroads:

The anticipated area of influence (AOI) typically extends from each study interchange ramp terminal intersection to the nearest signalized intersection to the east and west or additional intersections as needed. **Table 1** summarizes the proposed study intersections.

Exhibit / Figure # - Table 1 attached ☒

D. *Project Schedule*

Identify the schedule of production activities consistent with a proposed conceptual funding plan and opening year.

The work program shows available funds for FY 2019. Therefore, the Advance Production Process (APP) schedule is anticipated at this time. The scheduling notes that construction should be in conjunction with Project FM 439891-1. The exact scope is not yet finalized; however, expectations are as follows:

- Contract Letting – September 2019
- Contract Execution – December 2019
- Open to Traffic – July 2022

2.0 Analysis Years

A. *Traffic Forecasting*
   - Base year 2010
   - Horizon year 2040

B. *Traffic Operational Analysis*
   - Existing year 2015/2016
   - Opening year 2020
   - Design year 2040

A year of failure analysis shall be performed for Preferred Alternative, in case a failing LOS is obtained in Design Year.

3.0 Alternatives

The No-Build and Build alternatives shall be analyzed in the IAR. Details of all reasonable build alternatives considered, including those eliminated from further considerations, shall be documented. The documentation for the alternatives eliminated can be minimal like a summary of what was considered, reasons for elimination etc. Build Alternatives meeting purpose and need of the project shall have a more detailed description and evaluated in the IAR.

The implementation of TSM&O alternative will be considered in the IAR.

4.0 Data Collection

The type of data that may be used should be identified.

A. *Transportation System Data*

Data will be collected for the study from numerous sources including, but not limited to, the following.

a. Roadway Characteristics Inventory Database
b. Broward County traffic signal timing data
c. FDOT Florida Traffic Online Website
d. FDOT Florida Traffic Information (FTI) DVD
e. FDOT Crash Data (Crash Analysis Reporting System – CARS)
f. Field visits to confirm geometry, storage lengths, signal phasing, queues, etc.
g. FDOT Five (5) Year Work Program
h. SIS Funding Strategy First Five Year Plan (FY 2014/2015 through 2018/2019)
i. SIS Funding Strategy Second Five Year Plan (FY 2019/2020 through 2023/2024)
j. Broward Metropolitan Planning Organization (MPO) Transportation
k. Transportation Improvement Program (TIP)
l. FDOT traffic volume forecasts developed under the *Traffic Data Collection & Traffic Projections for I-95 PD&E Study from SW 10th Street to Hillsboro Boulevard FM No 436964-1-22-02 Dated May 19, 2016*

m. FDOT Straight Line Diagrams
n. Conceptual Development Alternatives (CDAs) for the I-95 Express Lanes Phase 3
o. I-95 Broward and Palm Beach Origin-Destination Study

B. Existing and Historical Traffic Data

FDOT will provide the existing traffic data (2015/2016) for this project.
Traffic data includes:

- Arterial bi-directional counts in 15-minute increments
- Weekday peak period (AM and PM) turning movement counts (TMCs) at AOI signalized intersections and on- and off-ramp terminal intersections. TMCs include passenger vehicles, buses, trucks and pedestrian/bicyclist counts where applicable.

System-wide AM and PM peak hours will be identified from the traffic data and existing peak hour volumes will be determined.

The traffic data will be supplemented with existing and historical traffic data (AADTs) from the FDOT Florida Traffic Online website and available previous studies.

C. Land Use Data

The Broward MPO 2040 Long Range Transportation Plan (LRTP), Deerfield Beach comprehensive plans, applicable master plans, and active development of regional impacts (DRI) applications will be reviewed and documented in the IMR.

D. Environmental Data

Efficient Transportation Decision Making (ETDM) Environmental Data, Environmental Data from Broward County Environmental Protection and Growth Management Department and the Florida Geographic Data Library (FGDL) will be reviewed. Environmental issues, including socio-cultural features, contamination, natural resource features and noise sensitive receptors will be investigated, documented and considered as part of the IMR.

E. Planned and Programmed Projects

Applicable master plans, SIS Plans, FDOT's Five (5) Year Work Program, SW 10th Street PD&E draft tentative work program, interchange planning and safety studies performed by FDOT District Four, Broward MPO TIP, Broward MPO 2040 LRTP, local government comprehensive plans, and active development of regional impact (DRI) applications will be reviewed and documented in the I-95 IMR. Additionally, the I-95 Express Lanes Phase 3 will be reviewed to identify planned and programmed improvements within the IMR limits. The IMR improvements will be developed consistent with these plans or steps will be taken to achieve consistency.

5.0 Travel Demand Forecasting

A. *Selected Travel Demand Model(s)*

The modeling efforts have been provided by FDOT on the *Traffic Data Collection & Traffic Projections for I-95 PD&E Study from SW 10th Street to Hillsboro Boulevard FM No 436964-1-22-02 Dated May 19, 2016*. The Southeast Florida Regional Planning Model (SERPM), Version 7.061 has been used for travel forecasting for this project. SERPM 7.061 is an Activity-Based Model (ABM) that simulates both household-level and person-level travel choices including intra-household interactions with household members. SERPM 7.061 model is validated to Year 2010 conditions and includes a future year 2040 scenario based on the adopted Cost Feasible plans from Miami-Dade MPO, Broward MPO, and Palm Beach MPO. It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies. The RTTAC-MS comprises representatives from FDOT District 4, District 6, and the three MPOs in South Florida.

B. *Project Traffic Forecast Development Methodology*

Describe the methodology and assumptions in developing the future year traffic volumes (AADT and DDHV)

As presented on the *Traffic Data Collection & Traffic Projections for I-95 PD&E Study from SW 10th Street to Hillsboro Boulevard FM No 436964-1-22-02 Dated May 19, 2016*, the comprehensive traffic forecasting method was used to develop the AADT for these PD&E studies. The traffic forecasting methodology used for each approach of each intersection was based on the 2016 AADT (from field), and 2010 and 2040 SERPM 7.061 model volumes. The recommended 2040 AADT were calculated by applying the model growth rate to the 2016 AADT. For all the roadway links, the 2016 and 2040 AADT has been compared, and a minimum compound growth rate of 0.5% has been adopted. Then the 2020 and 2030 volumes were interpolated using 2016 AADT and recommended 2040 volumes.

C. *Validation Methodology*

Describe the validation methodology using current FDOT procedures and data collection procedure.

Identify how modifications to the travel demand forecasting model will be made, including modifications to the facility type and area type for links, modifications to socio-economic data and all input and output modeling files for review.

Model validations have been conducted under the *Traffic Data Collection & Traffic Projections for I-95 PD&E Study from SW 10th Street to Hillsboro Boulevard FM No 436964-1-22-02 Dated May 19, 2016*. The SERPM 7.061 model has already been validated to Year 2010 conditions following the standard model validation procedures and principles and best practices in the industry. In addition, the growth rates of historical counts, historical counts plus model projections, SERPM socioeconomic growth, and the comprehensive model to model projections methodology were summarized and compared with each other. Based on the comparison and discussions with the FDOT Project Manager, the comprehensive traffic forecasting method was used to develop the AADT for these PD&E studies.

D. *Adjustment Procedures*

Identify the process used to adjust modeled future year traffic to the defined analysis years. Discuss how trends/growth-rates will be factored into this, if applicable.

If the model growth rate was less than the recommended 0.5% growth rate, a 0.5% growth rate was utilized. Otherwise, the growth factor calculated based on the model volumes was used. Then the 2020 and 2030 volumes were interpolated using 2016 AADT and recommended 2040 volumes. For the roadway segments where the SERPM 7.061 2040 model volumes are lower than the SERPM 7.061 2010 model volumes, or are not included in the SERPM 7.061 network, the future 2020, 2030, and 2040 AADTs were calculated using 2016 AADT and a compound growth factor of 0.5%.

E. *Traffic Factors*

- Utilizing recommended ranges identified in the Project Traffic Forecasting Handbook and Procedure (525-030-120).
- Utilizing other factors, identified below

Description:

The directional design hour volumes (DDHV) development process for the I-95 IMR will involve the application of the standard procedure of adjusting the average annual daily traffic (AADT) volumes with the Standard K and D_{30} traffic factors. However, it will be adjusted to produce AM

and PM peak hour volumes along the different corridors as follows:

- Standard K will be applied to the highest peak hour period between AM or PM; the other period K factor will be determined as a ratio based on existing counts.
  Standard K = 9.0 will be applied to I-95 mainline, ramps, and along the crossing corridors between the I-95 Ramps. Other K factors will be based on existing and historical counts. D factors will be calculated by link for each peak period based on existing and historical data.
- 24T and DHT_f will be calculated for each intersection or link based on existing and historical data. A minimum DHTf factor of 2.0% will be used.
- PHF for Existing Year Analysis will be based on existing counts.
- PHF for Future Year Analyses: PHF=0.95 for I-95 Mainline; PHF=0.92 for intersections and I-95 Ramps; If Adaptive Signal Control, then PHF=1.00.
- TMTool, rounding and balancing will be conducted; therefore, the final K and D may not match the initial values.

Roadway	K	D	24T	DHT_f	PHF
I-95	9.0	50.5 to 100	4.0 to 6.0	2.0 to 3.0	0.85 to 0.99
SW 10th Street	5.7 to 12.8	50.0 to 83.4	3.0 to 8.0	2.0 to 3.0	0.93 to 0.97
Hillsboro Boulevard	6.3 to 9.0	50.0 to 93.3	3.0 to 9.0	2.0	0.94 to 0.96
Sample Road	3.9 to 9.5	50.7 to 71.2	3.0 to 7.0	2.0 to 3.0	0.92 to 0.96

Source: AECOM preliminary calculations based on existing and historical volume data. A minimum DHT_f factor of 2.0% will be used.

6.0 Traffic Operational Analysis

The area type, traffic conditions, and analysis tools to be used are summarized in this section.

A. Existing Area Type/Traffic Conditions

Area Type	Conditions	
	Under Saturated	Saturated
Rural	☐	☐
Urban Area/Transitioning Area	☒	☐

B. Traffic Analysis Software Used

Software		System Component

Florida Department of Transportation Interchange Access Request Methodology Letter of Understanding (MLOU)

Type of request ☐ IJR ☒ IMR ☐ IOAR

Type of Process ☒ Programmatic ☐ Non-Programmatic

SR-9/I-95 from SW 10th Street to Hillsboro Boulevard, Broward County

Coordination of assumptions, procedures, data, networks, and outputs for project traffic review during the access request process will be maintained throughout the evaluation process.

Full compliance with all MLOU requirements does not obligate the Acceptance Authorities to accept the IAR.

The Requester shall inform the approval authorities of any changes to the approved methodology in the MLOU and an amendment shall be prepared if determined to be necessary.

Requestor	Humberto Arrieta *FDOT District 4*	5/22/17 *Date*
Interchange Review Coordinator	Scott Peterson *Project Development Manager*	5/22/17 *Date*
State Interchange Review Coordinator	Andrew Young *Systems Planning Office – Central Office*	6/2/17 *Date*

Other	☐	☐	☐	☐	☐	☐	☐

C. *Calibration Methodology*

- *Calibration methodology and parameters utilized will be documented.*
- *Calibration Measures of Effectiveness (MOEs) and calibration targets.*

Calibration will be conducted and documented based on the guidelines presented on the *FDOT Traffic Analysis Handbook, March 2014.*

D. *Selection of Measures of Effectiveness (MOE)*

- *The Level of Service criteria for each roadway classification, including mainline, ramps, ramp terminal intersections and the crossroad beyond the interchange ramp terminal intersections are identified below.*

  Analyses of the I-95 system, including the mainline and the interchange ramps, will be based on criteria and policies detailed in the FDOT Interstate Access Request User's Guide, 2015 Edition. Freeway and ramp operations analyses will be conducted utilizing Highway Capacity Software (HCS 2010) (MOE: Density). Intersection analyses will be conducted using Synchro 9.0 software and results will be reported utilizing the HCM 2010 output when feasible. Otherwise, results will be reported utilizing the HCM 2000 output (MOE: Delay).

  FDOT Topic No. 525-000-006 provides Level of Service (LOS) standards for the State Highway System (SHS). The following LOS criteria are considered acceptable for the IMR.

  Urbanized Areas over 500,000
  - SIS Facilities – LOS D
  - Other State Roads – LOS D

- *In addition to the Level of Service criteria, state other operational MOEs to be utilized for the evaluation of alternatives.*

  In addition to the signalized intersection LOS criteria stated above, operational criteria will also include the following:

  - Maximum volume-to-capacity (v/c) ratio
    - Each intersection movement should have a v/c ratio of 1.0 or less.
  - Interchange ramp queue length
    - The 95th percentile queue will be utilized to determine the required storage length for all interchange off-ramp queue lengths. The 95th percentile queue will be calculated utilizing HCM 2010 methodology when feasible. Otherwise, the intersection Queue Report will be utilized.

7.0 Safety Analysis

A. Detailed crash data within the study area will be analyzed and documented.

Years: 2012, 2013, and 2014
Source: FDOT Crash Data (CARS)

8.0 Consistency with Other Plans/Projects

A. The request will be reviewed for consistency with facility Master Plans, Actions Plans, SIS Plan, MPO Long Range Transportation Plans, Local Government Comprehensive Plans or development applications, etc.

B. Where the request is inconsistent with any plan, steps to bring the plan into consistency will be

developed.

C. *The operational relationship of this request to the other interchanges will be reviewed and documented. The following other IARs are located within the area of influence:* None. The I-95 IMR will consider the relationship of the interchanges within the study area

9.0 Environmental Considerations

A. *Status of Environmental Approval and permitting process.*
The IMR will identify potential long-term improvements to the interstate and adjacent roadway network. Once improvements have been identified, a determination of Environmental Approval and permitting process will be conducted.

B. *Identify the environmental considerations that could influence the outcome of the alternative development and selection process.*
Environmental issues, including socio-cultural features, contamination, natural resource features, and noise sensitive receptors, will be investigated, documented, and considered as part of the IMR.

10.0 Coordination

Yes	No/NA	
☒	☐	An appropriate effort of coordination will be made with appropriate proposed developments in the area.
☒	☐	Request will identify and include (if applicable) a commitment to complete the other non-interchange/non-intersection improvements that are necessary for the interchange/intersection to function as proposed.
☒	☐	Request will document whether the project requires financial or infrastructure commitments from other agencies, organizations, or private entities.
☒	☐	Request will document any pre-condition contingencies required in regards to the timing of other improvements and their inclusion in a TIP/STIP/LRTP prior to the Interstate access acceptance (final approval of NEPA document).
☒	☐	Request will document the funding and phasing.

**Explain if No or Not Applicable (N/A) is checked*:

11.0 Anticipated Design Exceptions and Variations

☒ *Design exceptions/variations are not anticipated, but if an exception/variation should arise it will be processed per FHWA and FDOT standards.*

☐ *The following exceptions/variations to FDOT, AASHTO or FHWA rules, policies, standards, criteria or procedures have been identified:*

12.0 Conceptual Signing Plan

☒ *A conceptual signing and marking plan shall be prepared and included in the access request.*

13.0 Access Management Plan

☒ *Access management plan within the area of influence will not be changed by the proposed*

improvements to the interchange.

☐ *The improvement will affect access management within the area of influence will be changed. An access management plan will be developed within the area of influence to complement the improvements to the interchange:*

14.0 FHWA Policy Points

☒ *The FHWA eight policy points will be addressed within the access request.*

SIGNALIZATION NOTES
1. CONTROLLER OPERATIONS:
-MAJOR STREET IS S.R. 834 (SAMPLE RD.).
-MINOR STREET IS I-95 SB RAMP.
-THE CONTROLLER SHALL BE WIRED FOR SIGNAL OPERATING PLAN AS SHOWN ABOVE WITH THE FOLLOWING:
(A) FLASHING OPERATION IS YELLOW ALONG S.R. 834 AND RED ALONG I-95 SB RAMP.
(B) SIGNAL TIMINGS ARE INITIAL AND MAY REQUIRE FIELD ADJUSTMENT AS DIRECTED BY THE ENGINEER.
2. STATIONS AND OFFSETS FOR STEEL MAST ARMS ARE MEASURED FROM THE BASELINE FOR S.R. 834 AS SHOWN.

2016 Existing Freeway HCS Operational Analysis

FREEWAY WEAVING WORKSHEET

General Information

Analyst	
Agency/Company	AECOM
Date Performed	
Analysis Time Period	AM

Site Information

Freeway/Dir of Travel	I-95 NB
Weaving Segment Location	Seg 1-Bet Copans & Sample
Analysis Year	EXISTING 2015/2016

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	One-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	1820ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	4560	0.95	3	0	1.5	1.2	0.985	1.00	4872
V_{RF}	340	0.97	2	0	1.5	1.2	0.990	1.00	354
V_{FR}	710	0.90	2	0	1.5	1.2	0.990	1.00	797
V_{RR}	0	0.97	2	0	1.5	1.2	0.990	1.00	0
V_{NW}	4872							V =	6023
V_W	1151								
VR	0.191								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	1151 lc/h
Interchange density, ID	0.8 int/mi	Weaving lane changes, LC_W	1540 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	1220 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	2760 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	709

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	5940 veh/h	Weaving intensity factor, W	0.314
Weaving segment capacity, c_w	8666 veh/h	Weaving segment speed, S	54.9 mph
Weaving segment v/c ratio	0.685	Average weaving speed, S_W	56.9 mph
Weaving segment density, D	27.4 pc/mi/ln	Average non-weaving speed, S_{NW}	54.5 mph
Level of Service, LOS	C	Maximum weaving length, L_{MAX}	4445 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = 0.604 using Equation (Exhibit 13-6)

V_{12} = 3536 pc/h

V_3 or V_{av34} 2315 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☑ Yes ☐ No

If Yes,V_{12a} = 3536 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}	6700	Exhibit 13-8		No

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}	4385	Exhibit 13-8	4600:All	No

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734 v_R + 0.0078 V_{12} - 0.00627 L_A$

D_R = 33.3 (pc/mi/ln)

LOS = D (Exhibit 13-2)

Speed Determination

M_S = 0.538 (Exibit 13-11)

S_R= 54.9 mph (Exhibit 13-11)

S_0= 63.4 mph (Exhibit 13-11)

S = 57.6 mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = using Equation (Exhibit 13-7)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F		Exhibit 13-8		
$V_{FO} = V_F - V_R$		Exhibit 13-8		
V_R		Exhibit 13-10		

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086 V_{12} - 0.009 L_D$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

D_s = (Exhibit 13-12)

S_R= mph (Exhibit 13-12)

S_0= mph (Exhibit 13-12)

S = mph (Exhibit 13-13)

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	One-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	1820ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	4260	0.95	3	0	1.5	1.2	0.985	1.00	4551
V_{RF}	400	0.95	2	0	1.5	1.2	0.990	1.00	425
V_{FR}	1480	0.98	2	0	1.5	1.2	0.990	1.00	1525
V_{RR}	0	0.95	2	0	1.5	1.2	0.990	1.00	0
V_{NW}	4551							V =	6501
V_W	1950								
VR	0.300								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	1950 lc/h
Interchange density, ID	0.8 int/mi	Weaving lane changes, LC_W	2339 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	1154 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	3493 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	663

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6416 veh/h	Weaving intensity factor, W	0.378
Weaving segment capacity, c_w	7883 veh/h	Weaving segment speed, S	50.0 mph
Weaving segment v/c ratio	0.814	Average weaving speed, S_W	54.9 mph
Weaving segment density, D	32.5 pc/mi/ln	Average non-weaving speed, S_{NW}	48.2 mph
Level of Service, LOS	D	Maximum weaving length, L_{MAX}	5583 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

VR	0.214								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	1244 lc/h
Interchange density, ID	0.8 int/mi	Weaving lane changes, LC_W	1465 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	599 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	2064 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	289

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	5732 veh/h	Weaving intensity factor, W	0.482
Weaving segment capacity, c_w	8284 veh/h	Weaving segment speed, S	53.6 mph
Weaving segment v/c ratio	0.692	Average weaving speed, S_W	52.1 mph
Weaving segment density, D	27.1 pc/mi/ln	Average non-weaving speed, S_{NW}	54.1 mph
Level of Service, LOS	C	Maximum weaving length, L_{MAX}	4680 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Analysis Year	EXISTING 2015/2016

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	One-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	1410ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	4275	0.95	3	0	1.5	1.2	0.985	1.00	4568
V_{RF}	835	0.88	2	0	1.5	1.2	0.990	1.00	958
V_{FR}	590	0.88	2	0	1.5	1.2	0.990	1.00	677
V_{RR}	0	0.88	2	0	1.5	1.2	0.990	1.00	0
V_{NW}	4568							V =	6203
V_W	1635								
VR	0.264								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	1635 lc/h
Interchange density, ID	0.8 int/mi	Weaving lane changes, LC_W	1968 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	935 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	2903 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	515

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6120 veh/h	Weaving intensity factor, W	0.400
Weaving segment capacity, c_w	8315 veh/h	Weaving segment speed, S	51.7 mph
Weaving segment v/c ratio	0.736	Average weaving speed, S_W	54.3 mph
Weaving segment density, D	30.0 pc/mi/ln	Average non-weaving speed, S_{NW}	50.8 mph
Level of Service, LOS	D	Maximum weaving length, L_{MAX}	5197 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Analysis Year	EXISTING 2015/2016

Project Description SW 10th Street SIMR

Inputs

Weaving configuration	One-Sided	Segment type	Freeway
Weaving number of lanes, N	4	Freeway minimum speed, S_{MIN}	15
Weaving segment length, L_S	1410ft	Freeway maximum capacity, C_{IFL}	2400
Freeway free-flow speed, FFS	70 mph	Terrain type	Level

Conversions to pc/h Under Base Conditions

	V (veh/h)	PHF	Truck (%)	RV (%)	E_T	E_R	f_{HV}	f_p	v (pc/h)
V_{FF}	5370	0.95	3	0	1.5	1.2	0.985	1.00	5737
V_{RF}	570	0.91	2	0	1.5	1.2	0.990	1.00	633
V_{FR}	620	0.87	2	0	1.5	1.2	0.990	1.00	720
V_{RR}	0	0.91	2	0	1.5	1.2	0.990	1.00	0
V_{NW}	5737							V =	7090
V_W	1353								
VR	0.191								

Configuration Characteristics

Minimum maneuver lanes, N_{WL}	2 lc	Minimum weaving lane changes, LC_{MIN}	1353 lc/h
Interchange density, ID	0.8 int/mi	Weaving lane changes, LC_W	1686 lc/h
Minimum RF lane changes, LC_{RF}	1 lc/pc	Non-weaving lane changes, LC_{NW}	1176 lc/h
Minimum FR lane changes, LC_{FR}	1 lc/pc	Total lane changes, LC_{ALL}	2862 lc/h
Minimum RR lane changes, LC_{RR}	lc/pc	Non-weaving vehicle index, I_{NW}	647

Weaving Segment Speed, Density, Level of Service, and Capacity

Weaving segment flow rate, v	6992 veh/h	Weaving intensity factor, W	0.395
Weaving segment capacity, c_w	8544 veh/h	Weaving segment speed, S	52.2 mph
Weaving segment v/c ratio	0.818	Average weaving speed, S_W	54.4 mph
Weaving segment density, D	33.9 pc/mi/ln	Average non-weaving speed, S_{NW}	51.8 mph
Level of Service, LOS	D	Maximum weaving length, L_{MAX}	4443 ft

Notes

a. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments".
b. For volumes that exceed the weaving segment capacity, the level of service is "F".

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Table of Contents

Section 1 Background 1-1

1.1 Study Purpose 1-1
1.2 Previous Studies 1-1
1.3 Study Area 1-3
1.4 Study Approach 1-6

Section 2 Existing Traffic Data 2-1

2.1 Historical Corridor Growth 2-1
2.1.1 SW 10th Street 2-1
2.1.2 Florida's Turnpike 2-2
2.1.3 I-95 2-3
2.2 Data Collection 2-3
2.2.1 Locations and Dates 2-3
2.2.2 Queues 2-5
2.2.3 Existing Travel Time 2-11
2.2.4 Bluetooth Origin-Destination 2-34
2.3 Corridor Traffic 2-36
2.3.1 Annual Average Daily Traffic 2-36
2.3.2 Traffic Distribution by Direction 2-43
2.3.3 Weekday vs. Weekend Traffic Volumes 2-43
2.3.4 Truck Traffic 2-44
2.4 Peak Period Traffic 2-47

Section 3 Existing Traffic Operational Analysis 3-1

3.1 Intersection Analysis 3-1
3.2 Study Area Operations 3-12

Section 4 Travel Demand Forecasting 4-1

4.1 Model Validation 4-1
4.2 Socioeconomic Data 4-7
4.3 Future Year model networks 4-15
4.4 Express Lane Time-of-Day Model 4-27
4.5 ELToD Choice Model 4-31

Table of Contents

Section 5 Future Traffic Forecast 5-1

5.1 Forecasting Process and Assumptions 5-1
5.2 Annual Average Daily Traffic Volumes 5-3
5.3 Future Origin-Destination Movements 5-12
5.4 Design Hour Traffic Forecasts 5-19
5.4.1 Future Traffic Factors 5-19
5.4.2 Future Corridor DDHVs 5-20
5.4.3 Express Lane Volumes 5-34

Section 6 Future Traffic Operational Analysis 6-1

6.1 No-Build 2040 6-1
6.2 Partial-Build 2040 6-13

1.1 STUDY PURPOSE

Currently, the Sawgrass Expressway (S.R. 869), in Broward County, begins at the connection of I-595/I-75 and ends on the east side of the interchange with Florida's Turnpike (S.R. 91). It converts to SW 10th Street and continues east as a principal arterial, with an interchange at I-95 (S.R.9). To the east of I-95, SW 10th Street continues as a local road. The SW 10th Street corridor has no direct access to or from Florida's Turnpike. Turnpike access is to and from the west via the Sawgrass Expressway. Traffic on SW 10th Street desiring access to Florida's Turnpike turns onto Powerline Road (S.R. 845) or onto Military Trail and travels either 4.6 miles north to Glades Road (S.R. 808) or 2.1 miles south to Sample Road (S.R. 834).

Florida's Turnpike Enterprise (FTE), working in conjunction with the Florida Department of Transportation (FDOT) District 4, and coordinating closely with Broward County, is studying the feasibility of a future SW 10th Street limited-access corridor. This project traffic forecast memorandum (PTFM) will support the effort. The SW 10th Street corridor is within the municipality of Deerfield Beach.

A Project Development and Environment (PD&E) study for SW 10th Street from Florida's Turnpike (S.R. 91) to I-95 (FPN: 439891-1) will begin in July 2017. FTE recently initiated a PD&E study to widen the Sawgrass Expressway from south of U.S. 441 (S.R. 7) to Powerline Road (FPN: 437153-1), which includes the evaluation of a full interchange at the Turnpike Mainline.

Improvements to SW 10th Street would enhance the benefit for full access to Florida's Turnpike at Sawgrass Expressway, and would improve regional connectivity between Florida's Turnpike and I-95. The upcoming efforts are focused on providing long-term transportation system improvements, improving overall traffic operations, reducing congestion, and enhancing safety and emergency response/evacuation for local traffic. The primary need for SW 10th Street improvements is addressing capacity/operational deficiencies for local traffic and regional connector traffic. Secondary considerations are serving existing and future need for modal connectivity, transportation demand, social demands, and economic development of the adjacent communities.

This PTFM evaluates existing operational conditions and provides traffic forecasts to develop coordinated long-term corridor operational needs through the year 2040 in support of the SW 10th Street PD&E and Sawgrass Expressway PD&E studies. The PD&E efforts supplement this PTFM and the Traffic and Revenue (T&R) study for SW 10th Street. This study considers the planned I-95 Express Lanes and interchange improvements from SW 10th Street to Hillsboro Boulevard interchanges to the east and the committed Sawgrass Expressway projects to the west.

1.2 PREVIOUS STUDIES

The need to improve SW 10th Street has been a longstanding identified need by Broward County and FDOT District 4. Previous proposals for improvements to SW 10th Street have focused on moving vehicles, with little consideration for livability issues that concern the adjacent residents,

resulting in strong opposition by the public to the proposed recommendations. As a result, improvements to SW 10th Street are not shown in the Broward Metropolitan Planning Organization (MPO) 2040 long range transportation plan (LRTP) known as *Commitment 2040*.

In 2015, the Broward MPO set up a consensus-building initiative with the communities along the SW 10th Street corridor to discuss the future of the corridor between Florida's Turnpike and I-95. The goal of the *SW 10th Street Consensus and Visioning Study* was to identify citizen concerns on current and future conditions and to develop consensus on potential near-term and long-term transportation improvements.

The effort focused on the cities along the section of the Sawgrass Expressway and the SW 10th Street corridor, including Coral Springs, Parkland, Coconut Creek, and Deerfield Beach. The team responsible for facilitating this process included Broward MPO staff, public outreach specialists, transportation planning professionals, and urban design experts. Between November 2015 and June 2016, the Community Oversight and Advisory Team (COAT) held numerous meetings and open houses with elected officials, homeowner and civic associations, and business and property owners to hear community concerns and suggestions. The process culminated in support for a new PD&E study for SW 10th Street including the following recommendations:

- Build depressed sections of roadway for the express lanes (ELs) between the Sawgrass Expressway and I-95
- Provide access from the ELs to neighborhoods along SW 10th Street
- Provide convenient access to the Publix/Newport Center while providing ingress/egress options to SW 10th Street
- Maintain accessibility to the Century Village existing entrances
- Minimize the use of flyovers adjacent to residential areas
- Provide noise walls where warranted for communities that want them
- Explore the use of adaptive signal technology
- Provide connectivity of bike/pedestrian facilities using table-top parks and other ideas
- Improve safety along the corridor, especially at intersections
- Coordinate with the I-95/SW 10th Street interchange and Turnpike/SW 10th Street interchange PD&E studies

The previous studies that had focused on moving vehicles, with little consideration for livability issues, include the following:

1992 – S.R. 869 from Florida's Turnpike to I-95 Environmental Assessment

In 1992, FDOT completed a PD&E study that evaluated alternatives to extend the Sawgrass Expressway from Florida's Turnpike to I-95. At that time, the need for the project was attributed to the substantial projected growth within Broward County resulting in future traffic demands along SW 10th Street. The study concluded with a proposed action of a six-lane, divided, limited-access expressway facility with a system of service roads running parallel to provide local access.

2008 – SW 10th Street Connector Feasibility Study (Sawgrass Expressway to I-95)

In 2008, FDOT District 4 initiated a new feasibility study along SW 10th Street, from Florida's Turnpike to I-95, to consider improvements that would satisfy both regional transportation demands and community needs along the corridor. That study developed a traffic technical memorandum (TTM) documenting existing conditions and future traffic conditions for both the No-Build alternative and various proposed build alternatives. In addition to the No-Build and Transportation System Management (TSM) alternatives, six build alternatives were considered.

Based on review and comments provided by the Broward MPO and FDOT, it was decided that further analysis and development of the traffic volumes should be conducted during a PD&E study if this project moved forward, but alternatives should consider ELs tying directly to I-95 and toll prices should be lowered to obtain significant operational improvement to the local intersections.

1.3 STUDY AREA

The study area includes:

- Sawgrass Expressway from the University Drive (S.R. 817) interchange to the Turnpike Mainline interchange
- SW 10th Street from Sawgrass Expressway/Turnpike Mainline interchange to Florida Atlantic University (FAU) Research Park Boulevard
- Turnpike Mainline from Atlantic Boulevard (S.R. 814) (MP 66) to Glades Road (MP 75)
- I-95 from Atlantic Boulevard (MP 36) to Congress Avenue-Peninsula Corp Drive (MP 50)

This segment of SW 10th Street connects three limited-access facilities: Florida's Turnpike, Sawgrass Expressway, and I-95, and:

- Runs east-west
- Is functionally classified as a Divided Urban Principal Arterial
- Is a Strategic Intermodal System (SIS) roadway facility
- Is a National Highway System (NHS) facility

- Is designated as an evacuation route
- Is a missing link in the planned regional ELs system network

This segment of SW 10th Street has the following characteristics within the project area:

Florida's Turnpike to Powerline Road

- Six lanes (three in each direction)
- Posted speed 45 miles per hour (mph)
- Access management Class 1, to just east of Powerline Road

Powerline Road to Military Trail

- Four lanes (two in each direction), to just east of Military Trail
- Posted speed 45 mph
- Access management Class 3

Military Trail to I-95

- Six lanes (three in each direction) from west of Military Trail to I-95
- Posted speed 40 mph
- Access management Class 3

The study area and project limits are shown on **Figure 1.1**.

FDOT	SW 10th Street PD&E Study Project Traffic Forecast Memorandum	Study Area	Figure 1.1

1.4 STUDY APPROACH

The study approach for this analysis included traffic data collection, analysis of traffic operations, and traffic volume forecasting.

Traffic volume, origin-destination, and speed data needed for these efforts were collected as follows:

- Historical traffic data were summarized to identify historical growth trends.
- Sawgrass Expressway and SW 10th Street to Powerline Road traffic count data were collected in October and November 2014 as part of the Sawgrass Expressway (south of Sunrise Boulevard to south of U.S. 441) PD&E study Traffic Technical Memorandum (TTM) efforts. These included intersection turning movement counts and 24-hour continuous counts.
- SW 10th Street traffic counts were collected by FDOT District 4 in March 2016 for a PD&E study for I-95 (SW 10th Street to Hillsboro Boulevard.)
- Travel time/speed runs were completed by FTE in October 2016 on the Sawgrass Expressway, SW 10th Street, Florida's Turnpike, and I-95 within the project study area.
- Turning movement counts and 24-hour continuous counts were collected by FTE along SW 10th Street, Powerline Road, and Military Trail in October 2016.

With the need to provide traffic as design hour traffic forecasts by hour, the traffic forecasting process was accomplished through a multi-step process using the following three modeling tools:

- Regional Travel Demand Model Southeast Florida Regional Planning Model (SERPM 6.5.4) that was used for the Sawgrass Widening PD&E study
- Subarea Model for the Sawgrass Expressway, Florida's Turnpike, SW 10th Street, and I-95 corridors
- Express Lane Time-of-Day Model (ELToD) to identify the traffic volume split between managed lanes and general lanes

Once the forecasted volumes were identified, traffic analysis was accomplished using analysis software, including:

- Synchro for intersection analysis
- VISSIM to evaluate the EL operations and overall system operations

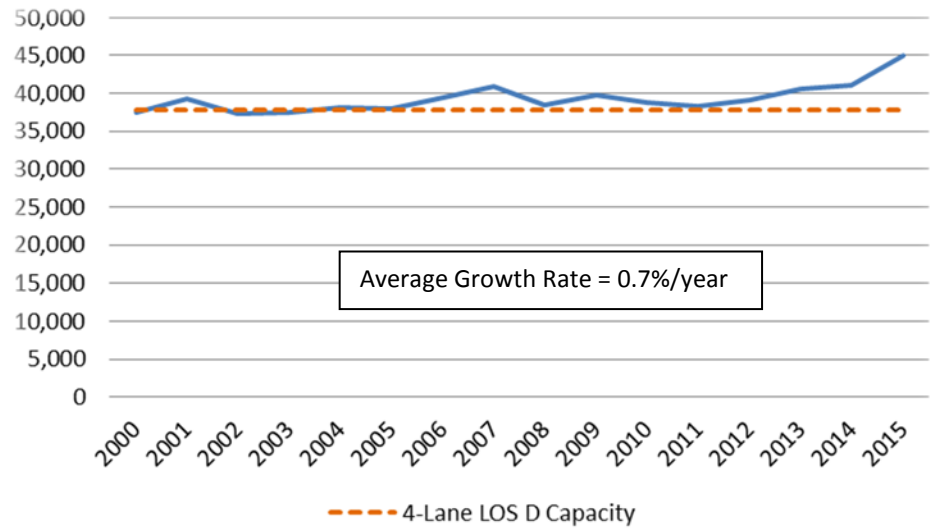
2.1 HISTORICAL CORRIDOR GROWTH

Annual average daily traffic (AADT) volumes from year 2000 through year 2015 have been summarized graphically for SW 10th Street, Sawgrass Expressway, Florida's Turnpike (Southern Coin System), and I-95. Historical AADT data were used to calculate the average annual growth rate of the roadways in the study area. This data is provided in **Appendix A**. Segment AADTs were weighted based on roadway segment length to identify an AADT for the entire roadway.

2.1.1 SW 10th Street

SW 10th Street between the Sawgrass Expressway/Turnpike Mainline interchange and I-95 interchange has an average annual growth rate of 0.7 percent per year, as shown in **Chart 2.1.** Volume data are the weighted averages of three portable traffic monitoring sites (PTMS) count sites: PTMS #3010 (Sawgrass Mainline just east of the Florida's Turnpike interchange), PTMS #3012 (SW 10th Street just east of Powerline Road), and PTMS #3015 (SW 10th Street just west of I-95). The chart shows that SW 10th Street exceeds the four-lane Level of Service (LOS) D capacity on a daily basis for a four-lane non-state facility.

Chart 2.1
SW 10th Street Historical AADT Volumes



2.1.2 Florida's Turnpike

There are two FTE systems within the study area: the Sawgrass Expressway and the Southern Coin System (S.R. 91). The AADT volumes are from the FTE *Traffic Engineer's Annual Report* (TEAR). The Sawgrass Expressway within the project study area had a 2015 AADT of 78,700 and a 2.8 percent per year average annual growth rate, as shown in **Chart 2.2**. The Southern Coin System within the study area had a 2015 AADT of 94,200 and an average annual growth rate of 1.5 percent per year, as shown in **Chart 2.3**. The charts show that volumes on the Turnpike systems are exceeding the volumes during the peak growth period that occurred in 2005-2006.

Chart 2.2
Sawgrass Expressway Historical AADT Volumes

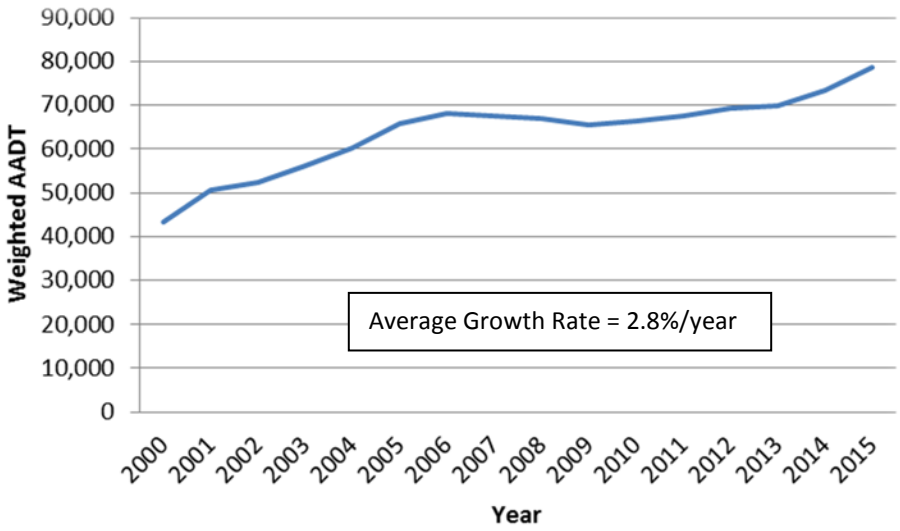


Chart 2.3
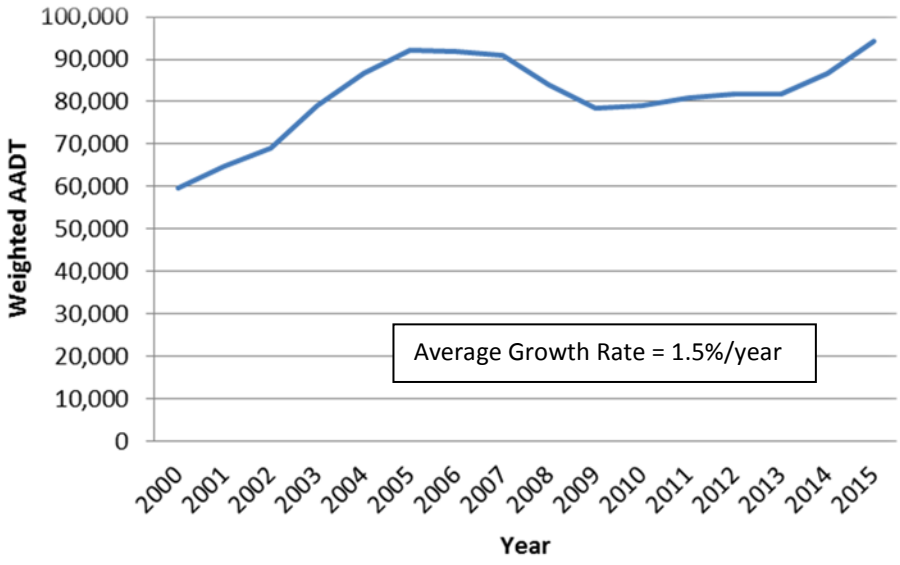
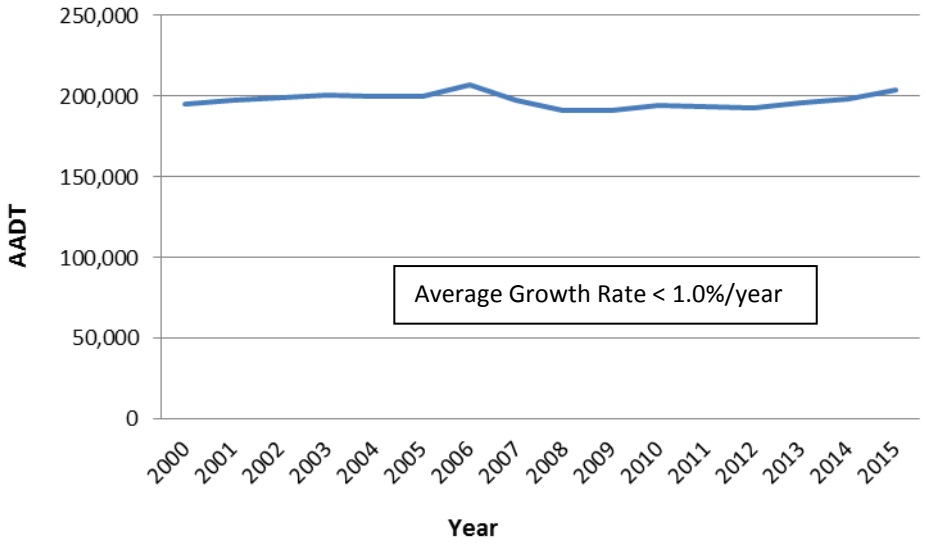
Florida's Turnpike (Southern Coin System) Historical AADT Volumes



2.1.3 I-95

Traffic volumes from the telemetered traffic monitoring site (TTMS) #0163 on I-95 just north of 48th Street in Pompano Beach were used to calculate the growth rate. The volumes show minimal growth over the last 15 years, which reflects I-95 not being able to accommodate more traffic. **Chart 2.4** shows the historical AADT volumes for I-95, with a 2015 AADT of 204,200.

Chart 2.4
I-95 Historical AADT Volumes



2.2 DATA COLLECTION

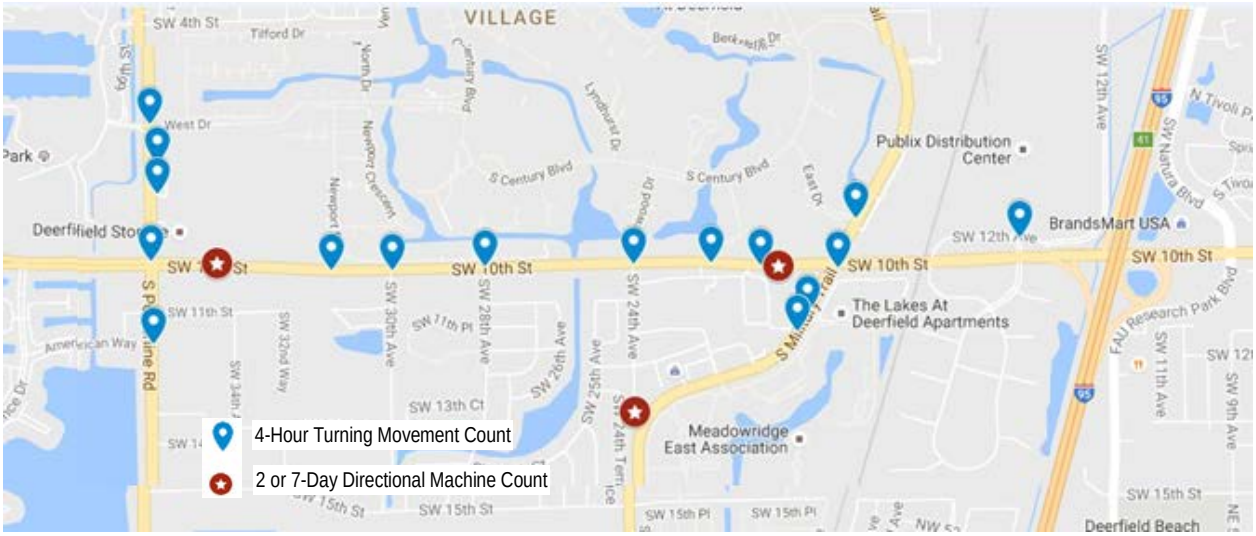
The categories of data collected and their sources are noted in this section.

2.2.1 Locations and Dates

FDOT District 4 provided existing 2016 volumes that had been summarized in the *Traffic Data Collection & Traffic Projections for I-95 PD&E Study from SW 10th Street to Hillsboro Boulevard*, dated May 19, 2016. The data collection effort was completed March 8 through March 10, 2016. A comparison of these volumes with volumes from previous studies revealed significant differences. In most cases, the District's March 2016 data showed lower volumes.

In order to address the discrepancies and to supplement existing data, additional 4-hour turning movement counts were conducted at 16 locations and 2-day to 7-day directional machine counts were collected at 3 locations. These additional counts were collected by FTE between October 18 and October 25, 2016, at the locations shown on **Figure 2.1**.

Figure 2.1
Additional Data Collection Locations

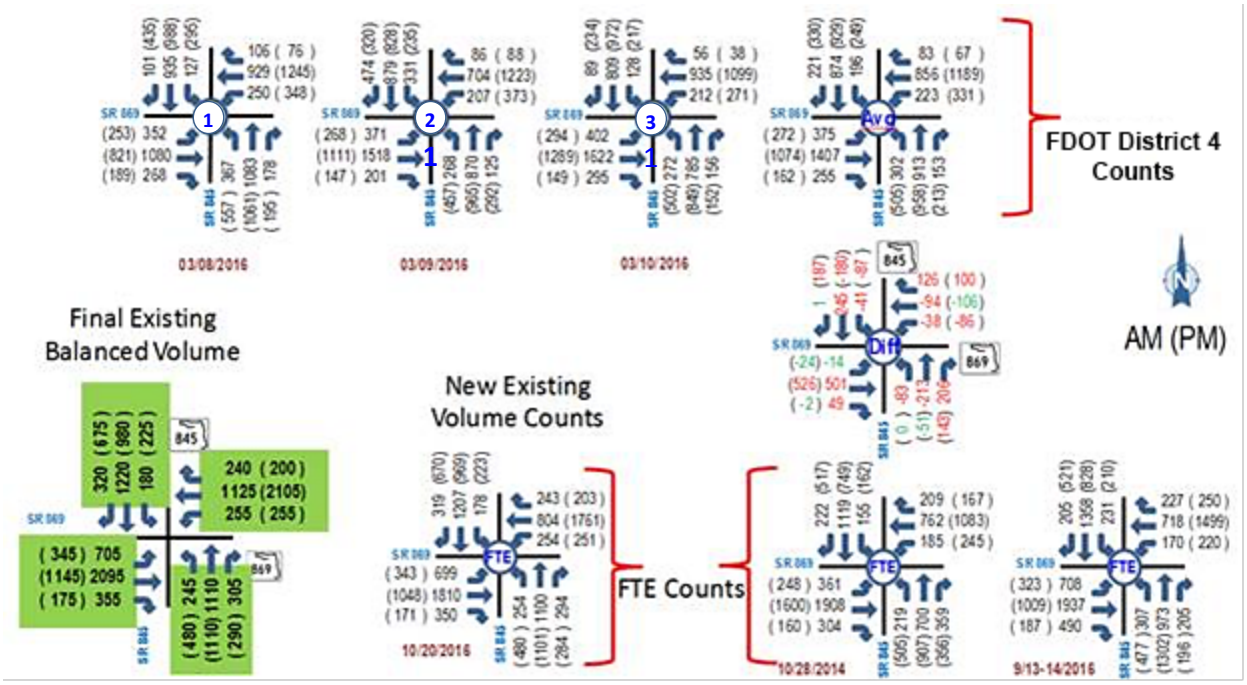


The additional counts verified that the March 2016 data presented lower volumes. Therefore, adjustments were made to develop balanced existing 2016 traffic volumes throughout the study area. The March 2016 intersection turning movement count data were replaced with the October 2016 data between Powerline Road and Military Trail. I-95 ramp volumes were adjusted to volumes obtained as part of the Broward County Interchange Master Plan reports.

As an example of this adjustment, the initial turning movement volumes and the balanced volumes for the intersection of SW 10th Street with Powerline Road are shown on **Figure 2.2**. These calculations are included in **Appendix A**.

Then, volumes were balanced to a control point west of Waterways Boulevard matching volumes obtained for the Sawgrass Expressway data collection efforts. The Sawgrass Expressway data collection effort included hose counts conducted in March 2016 for the non-tolled ramps on the Sawgrass Expressway and the Turnpike Mainline as part of the FTE's annual traffic data collection effort. The mainline and tolled ramp data was obtained in March 2016 to correspond with the non-tolled ramps. This data were used to develop the existing peak period peak hour traffic volumes for the Sawgrass Expressway, Turnpike Mainline and the study area interchange ramps. To develop the turning movements for the study area ramp intersections, traffic data from the on-going PD&E and traffic studies along Sawgrass Expressway and the Turnpike Mainline were used to determine the 2016 arterial traffic and turning movement splits. Traffic data from earlier years were normalized to year 2016 using a growth rate.

Figure 2.2
Existing Count Adjustment Example



2.2.2 Queues

Field observations were made during the week of October 17, 2016, to observe and document traffic bottlenecks and congested areas along Sawgrass Expressway, SW 10th Street, Florida's Turnpike, and I-95, and queuing on the ramps and SW 10th Street. The study area roadways were travelled during weekday AM and PM peak periods and queue observations were noted. In general, the following conditions were observed:

- On a day-to-day basis, the beginning and ending time of the worst congestion and queuing varies.
- During the AM peak period, the heaviest congestion with frequent stop-and-go conditions was observed in both northbound and southbound directions on I-95.
- During the PM peak period, significant congestion with frequent stop-and-go conditions was observed in both northbound and southbound directions on I-95.
- Crashes during peak periods compounded congestion severity and increased the extent and duration of traffic queues.

The following is a summary of observations along each of the major roadways within the study area.

Sawgrass Expressway

For the most part, Sawgrass Expressway traffic operations were stable, with the majority of vehicles traveling faster than the posted speed limit and no significant queueing observed. However, congestion conditions occurred at the following locations:

- During the typical AM peak period, moderate eastbound queues were observed at Sawgrass Expressway approaching the signalized SW 10th Street/Waterways Boulevard intersection and on the eastbound Collector-Distributor road between the southbound on-ramp and the northbound on-ramp to Florida's Turnpike.
- During the PM peak period, the right lane of the University Drive westbound off-ramp and the upstream Sawgrass Expressway westbound shoulder were closed at approximately 6:00 PM due to construction activity, which caused significant congestion on Thursday, October 20, 2016, resulting in queues beyond the Sawgrass Expressway toll plaza to the east.

SW 10th Street

There are nine signalized intersections between Sawgrass Expressway and FAU Research Park Boulevard. Congestion worsened at the western and eastern ends of the corridor where the closely spaced intersections and existing signal progression reduced eastbound and westbound SW 10th Street throughput. In the AM peak period, eastbound SW 10th Street experienced the heaviest volumes and significant congestion along the entire roadway. In the PM peak period, the westbound direction experienced the heavier congestion.

AM Peak Observations:

- Significant queues between I-95 and South Military Trail in both directions of SW 10th Street
- Heavy eastbound queues at the intersection with South Military Trail
- Heavy northbound queues at the intersection with South Military Trail
- Heavy eastbound queues at the intersection with Powerline Road

PM Peak Observations:

- Heavy westbound SW 10th Street queues from South Military Trail to the I-95 Interchange
- Moderate eastbound queues at the intersection with South Military Trail
- Heavy southbound queues along South Military Trail north of SW 10th Street
- Moderate queues at Powerline Road on all approaches

Florida's Turnpike (Southern Coin)

Traffic flow on Florida's Turnpike was significantly better than I-95 at the same cross streets. Crashes and incidents during peak periods compounded congestion severity and increased the extent and duration of traffic queues.

AM Peak Observations:

- Queues back up from the northbound Glades Road off-ramp onto the mainline
- Queues back up from the northbound Sample Road off-ramp onto the mainline
- Vehicles reduce speed southbound between Sawgrass Expressway and Sample Road
- Queues back up from Commercial Boulevard onto the southbound mainline due to signal operations beyond the toll plaza

PM Peak Observations:

- Queues back up from the southbound Glades Road off-ramp onto the mainline
- Northbound queue from the Lantana Toll Plaza results in queue jumpers
- Queues back up from the northbound Sawgrass Expressway off-ramp onto the mainline
- A crash occurred on Tuesday, October 18, 2016, at approximately 4:30 PM, which eventually shut down the southbound mainline and required vehicles to exit and use I-95. The Florida's Turnpike did not reopen until approximately 7:00 PM. Therefore, the Tuesday PM data were removed from travel time summaries.

I-95

I-95 was severely congested during the AM and PM peak hours. Single occupancy vehicles were frequently observed traveling in the HOV lane. Trucks were also frequently seen in the left general purpose travel lane despite the signage prohibiting them from using the left two lanes.

AM Peak Observations:

- Vehicles slow northbound between SW 18th Street and Palmetto Park Road
- Queues back up from the Glades Road northbound off-ramp onto northbound I-95 for more than one mile
- Queues back up onto I-95 from the northbound Congress Avenue off-ramp
- Northbound stop-and-go conditions in the area around Yamato Road (S.R. 794)
- Vehicles slow southbound between the Yamato Road and Congress Avenue interchanges
- Moderate queues occur before the SW 10th Street southbound off-ramp

PM Peak Observations:

- Northbound heavy queues near Sample Road until north of the on-ramp merge
- Moderate queues at the northbound SW 10th Street off-ramp
- Heavy congestion around Glades Road in both the northbound and southbound direction. The northbound off-ramp queues back onto I-95 and extend approximately 2,000 feet in the right lane.
- Southbound heavy queues between Camino Real and Glades Road, SW 10th Street and Hillsboro Boulevard (S.R. 810), and Atlantic Boulevard and Copans Road
- Moderate queues southbound between Copans Road and Sample Road
- Moderate queues for the approaches at the first signalized intersection of the Atlantic Boulevard southbound off-ramp

These observations are shown on **Figure 2.3** and **Figure 2.4**.

2.2.3 Existing Travel Time

Travel time runs were completed and available speed data were collected to provide more data to help note where congestion is occurring along roadways in the study area.

HERE Data

To complement the field-collected travel time runs, commercial travel speed data were used to develop graphical representation of degrees of congestion and travel speeds in the form of congestion scans. The data were supplied by HERE, formerly Nokia/Navteq, which acquires continuous roadway travel speeds through agreements with various cellphone providers and data sensors. These data are shared openly with public agencies for use in enhancing transportation planning. The data are also archived and processed within a tool, the Regional Integrated Transportation Information System (RITIS) tool, developed by the Center for Advanced Transportation Technology Laboratory at the University of Maryland, which has also been made available to the FDOT. RITIS was used for this effort. The speed thresholds used in the scans were customized by FTE to be consistent with *Highway Capacity Manual* (HCM) level of service thresholds.

The congestion scans were created to be consistent with the data collection time frame of the travel time runs and supplemental traffic data collection efforts. **Figures 2.5** through **2.8** reflect the congestion scans for the Sawgrass Expressway, SW 10th Street, Florida's Turnpike, and I-95, respectively. Note that colors range from red, indicating the slowest travel speed, through green, indicating free-flow or a higher rate of travel speed.

Sawgrass Expressway has posted speed limits of 65 mph and the collector-distributer road/ramps east of Lyons Road are posted 45 mph. SW 10th Street is posted 45 mph. The posted speed for the Turnpike Mainline and I-95 is 65 mph.

Results indicate:

- Sawgrass Expressway traffic flows near the posted speed limit.
- SW 10th Street is congested near I-95, most notably in the AM peak period approaching I-95.
- Florida's Turnpike congestion occurs mostly in the northbound direction, especially in the AM peak period.
- I-95 is congested in both peak periods, though more so in the PM peak period.

Field-Collected Data

Travel time runs were completed on Tuesday, October 18, 2016, Wednesday, October 19, 2016, and Thursday, October 20, 2016, generally in the time periods between 6:30 – 9:30 AM and 4:00 – 7:00 PM. Runs were done on the Sawgrass Expressway, SW 10th Street, Florida's Turnpike, and I-95 within the study area.

The resulting AM and PM peak period average speeds are summarized in **Table 2.1**, and the speed charts are shown in **Charts 2.5** through **2.20**. The charts depict the time each travel speed run began, and an average of the runs.

Using the average speed information from the travel time runs and the HERE data, the average times to drive each roadway and each direction are summarized in **Table 2.2**. Note the values are not the same as the data collected using different methods.

Table 2.2
Existing Travel Time Summary

Roadway and Travel Direction	Travel Time (minutes)			
	Field Collected Data		HERE Data	
	AM Peak Period	PM Peak Period	AM Peak Period	PM Peak Period
Sawgrass Expressway (6.5 miles)				
Eastbound/Northbound	5.7	5.4	7.3	7.5
Westbound/Southbound	5.7	6.6	7.0	6.9
SW 10th Street (3.3 miles)				
Eastbound	6.4	4.7	7.8	6.2
Westbound	4.5	5.1	7.1	8.5
Florida's Turnpike (29.3 miles)				
Northbound	25.5	25.1	28.9	27.1
Southbound	24.8	24.4	27.2	26.3
I-95 (16.1 miles)				
Northbound	18.2	19.7	21.6	21.2
Southbound	16.9	28.4	25.7	34.4

Results indicate:

- Sawgrass Expressway traffic flows above the posted speed limit, except in the westbound/southbound direction in the PM peak period. Travel speeds are notably lower near 6:00 PM.
- SW 10th Street experiences lower speeds eastbound in the AM peak period and westbound in the PM peak period. As expected, traffic slows at the major signalized intersections.
- Florida's Turnpike runs at or above posted speeds in both the AM and PM peak periods; however, in the AM peak period both directions experience congestion. Congestion occurs in the northbound direction (near 8:00 – 8:15 AM) from Atlantic Boulevard to Glades Road and in the southbound direction (near 8:15 AM and 8:40 AM) at Lake Worth Road, Atlantic Avenue, and Sample Road.
- I-95 is congested in both peak periods, with traffic speeds below posted speeds. This is worse in the PM peak period, most notably in the southbound direction.

Existing traffic count data are provided in **Appendix A**.

2.2.4 Bluetooth Origin-Destination

Origin-destination data were collected by FTE and FDOT District 4 as described below. These data will be used to develop future corridor forecasts.

Florida's Turnpike

Resource Systems Group, Inc. (RSG) conducted an origin-destination study for FTE for the Sawgrass PD&E study, with an expanded geographic coverage area on corridors impacted by SW 10th Street, including sections of I-95, Sawgrass Expressway, Florida's Turnpike, and I-595 in the Pompano Beach and Fort Lauderdale area. The purpose of the study was to estimate weekday travel patterns over a 24-hour period for the following four different time periods:

- AM: 6:30 AM – 9:30 AM
- Midday: 9:30 AM – 3:30 PM
- PM: 3:30 PM – 6:30 PM
- Overnight: 6:30 PM – 6:30 AM

The result of the study is an origin-destination matrix providing vehicle trip volumes for each of the four time periods.

In order to provide a basis for estimating travel patterns in the study area, Bluetooth detectors were used to track vehicle movements. Bluetooth detectors collect movement information from cell phones and similar devices as they pass near the detector. Deploying several detectors near roadways throughout an area allows devices (i.e., vehicles) to be tracked as they travel from detector to detector.

The detectors were deployed from Wednesday, February 18 through Tuesday, February 24, 2015, at 48 locations. Of the 48 detectors, the data from 5 detectors were discarded from the analysis because of too much missing data or a bad deployment location. Of the 43 remaining detectors, 16 were placed in paired deployments at 8 different locations, and 27 were placed in single-detector deployments. Thus the final analysis used a total of 35 unique detector locations, as shown on **Figure 2.9**. This set of data consists of approximately 5.4 million detections from approximately 158,000 devices.

Once collected, the data were processed through special algorithms to match unique media access control identifiers (MACIDs) of the devices to trace vehicles and develop origin-destination trips. Typically, this type of Bluetooth origin-destination survey results in collecting data for 5 to 10 percent of the total traffic. Therefore, to represent total traffic, a global expansion factor is applied. Based on the start time of the trips, the records were grouped into one of the four time periods, and trip tables in 33 zone systems were developed.

FDOT	SW 10th Street PD&E Study Project Traffic Forecast Memorandum	Bluetooth Detector Locations	Figure 2.9

For this SW 10th Street study, additional analysis was performed using the same data, but the study area was reduced to focus on the SW 10th Street corridor between Florida's Turnpike and I-95. The original 33-zone matrix was aggregated into an 8-zone system. This trip table was analyzed to identify the through movement volumes on SW 10th Street travelling between Florida's Turnpike and I-95. The through volumes represent vehicles that may use the ELs. **Tables 2.3** through **2.7** provide origin-destination summaries of SW 10th Street through volumes on a weekday daily and time period basis.

FDOT District 4

CTS Engineering, Inc. (CTS) provided FDOT District 4 origin-destination data for I-95 at the SW 10th Street interchange. Data were collected from Tuesday, April 19 through Thursday, April 21, 2016, using Bluetooth equipment. The data were collected during the peak periods of 7:00 – 9:00 AM and 4:00 – 6:00 PM. **Figure 2.9** shows the locations of the Bluetooth detectors used for that study.

In order to compare the origin-destination patterns from the 2015 RSG study for FTE and the 2016 CTS study for FDOT District 4, the data were grouped together to develop a similar format and coverage area. Since the CTS data are raw data without applying an expansion factor, the comparison between RSG and CTS data was done on a percentage basis (i.e., percentage of trips traveling from the eastern end of SW 10th Street near I-95 to the western end near Florida's Turnpike). The comparison shows that the patterns, in terms of vehicles traveling between Florida's Turnpike and I-95 using SW 10th Street, and traveling to/from Military Trail or Powerline Road to I-95 and Florida's Turnpike, are similar. Since both data-sets have similar origin-destination patterns, it was decided to use the RSG dataset, as it traces trips for longer distances and has been factored to represent total traffic at detectors.

Figures 2.10 and **2.11** depict the origin-destination pattern of eastbound and westbound trips on the SW 10th Street corridor. As shown on **Figure 2.10**, at the western end near Florida's Turnpike, SW 10th Street carries approximately 17,500 eastbound vehicles. Out of these 17,500 vehicles, 55 percent (9,500 vehicles) travel the full length of SW 10th Street, and either go onto I-95 or continue on SW 10th Street east of I-95. Similarly, as depicted on **Figure 2.11**, at the eastern end just west of I-95, of the 23,000 vehicles in the westbound direction, 48 percent (11,100 vehicles) travel the full length and continue onto Sawgrass Expressway. These full length trips should be similar in magnitude on a daily basis.

2.3 CORRIDOR TRAFFIC

2.3.1 Annual Average Daily Traffic

AADT volumes were balanced between the Sawgrass Expressway and Southern Coin based on counts taken in October 2016 and March 2016, respectively, and at I-95 based on a balanced 2015 profile. SW 10th Street volumes are not balanced and are based on counts taken in March and October 2016. Results are shown on **Figure 2.12**. The values shown are not the same as those from the Bluetooth origin-destination data collection effort, as the methods of data collection and adjustment of volumes are accomplished differently.

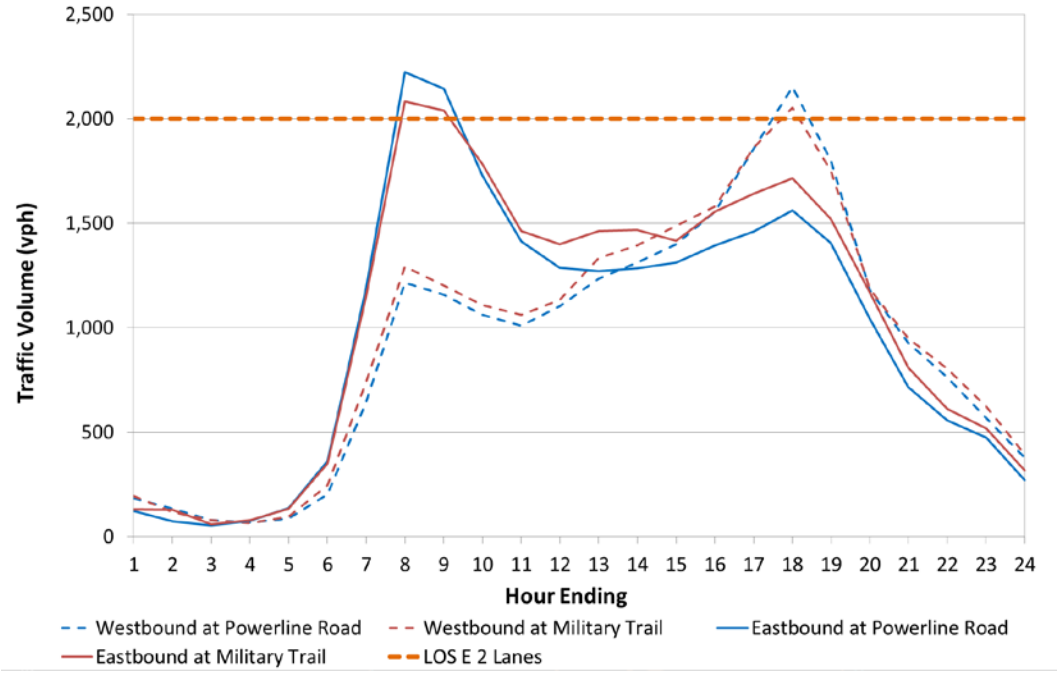
2.3.2 Traffic Distribution by Direction

The existing traffic distribution in the eastbound and westbound directions along SW 10th Street at Powerline Road and Military Trail is shown on **Chart 2.21**. The peak direction for SW 10th is eastbound during the AM peak and westbound during the PM peak, similar to other east-west arterials in Broward County. The chart shows that SW 10th Street exceeds the four-lane LOS E capacity during the peak periods in both the eastbound and the westbound directions.

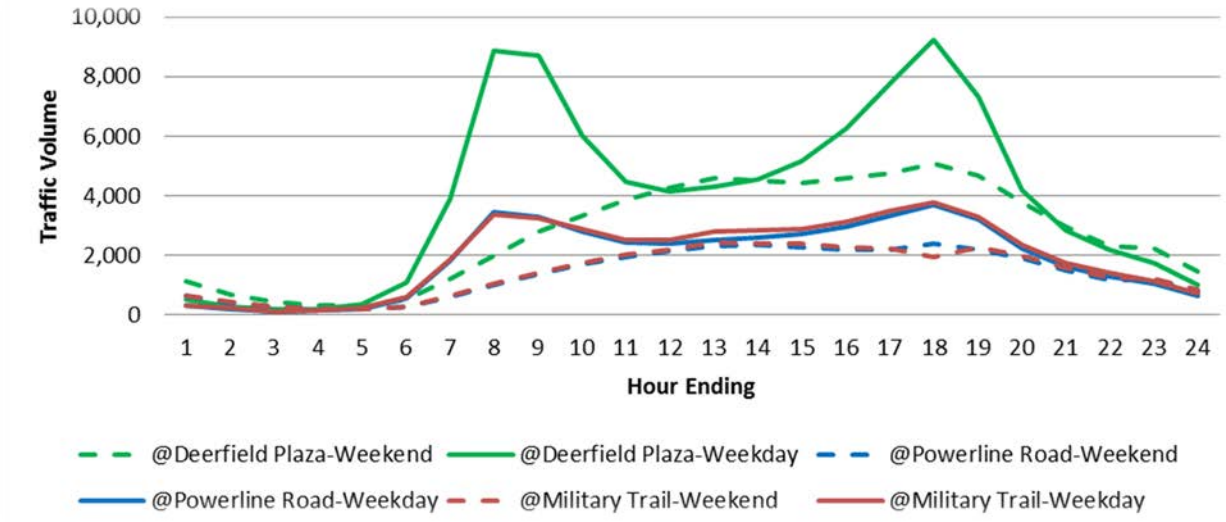
Chart 2.21
SW 10th Street Traffic Distribution



2.3.3 Weekday vs. Weekend Traffic Volumes

The comparison of existing weekday versus weekend traffic on SW 10th Street is shown on **Chart 2.22**. Weekday traffic typically shows peaks in the morning and evening, and weekend traffic typically shows increases up through noon, with leveling or slight increases into the early evening hours before decreasing later in the evening.

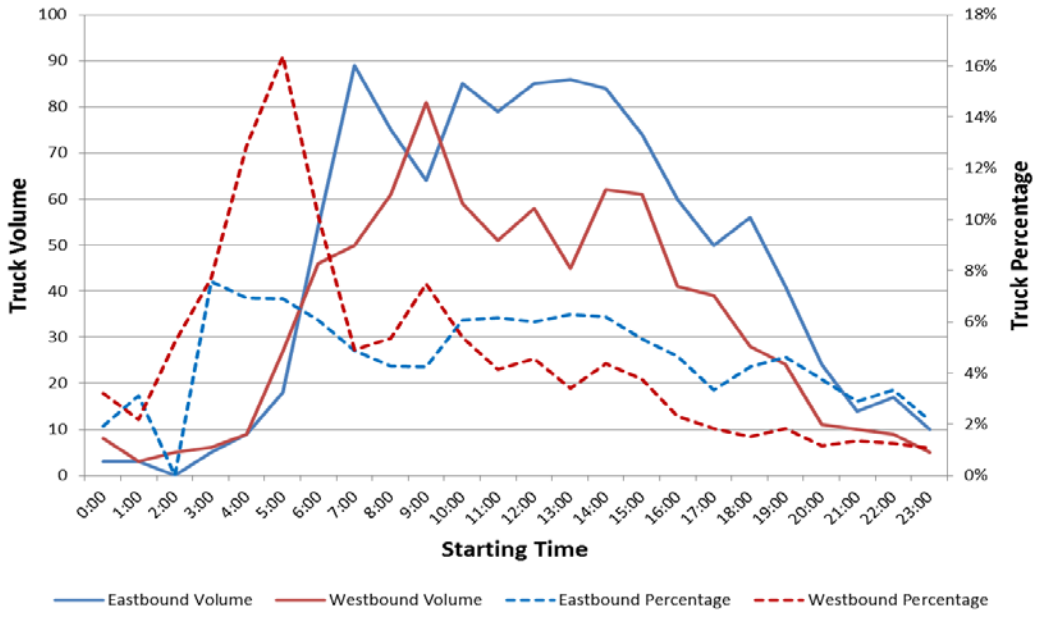
Chart 2.22
SW 10th Street Weekday vs. Weekend Traffic Volumes



2.3.4 Truck Traffic

The SW 10th Street truck traffic by hour per direction shown in volume and percentage of overall traffic, from the PTMS #3012 located just east of Powerline Road, is shown on **Chart 2.23**.

Chart 2.23
SW 10th Street Truck Volume by Direction



A design hour truck factor of 2 percent was used for the 10th Street corridor analysis, with the exception of the access to the Publix Distribution Center located just to the west of the I-95 interchange. **Table 2.8** provides a summary of truck percentages along the corridor as measured from counts collected in 2016 for the corridor. **Table 2.9** summarizes the truck percentages along SW 10th Street as measured during the peak hours from the turning movements counts collected for the project.

Figures 2.13 and **2.14** summarize the truck percentages used in the analysis for peak/design hour and peak/design period, respectively, at the access to the Publix Distribution Center and derived from project traffic data collected in the field.

Table 2.8
Sawgrass Expressway/SW 10th Street Corridor Design Hour Truck Percentage from FTI

	Site	Type	T24	Tf*
SW 10th Street				
East of Powerline Road	863012	PTMS	4.23%	2.12%
West of I-95	863015	PTMS	7.97%	3.99%
East of I-95	860070	PTMS	5.17%	2.59%

*No TTMS sites available, all class calculations based on limited data. Assumes ½ of T24.

Table 2.9
Sawgrass Expressway/SW 10th Street Corridor Peak Hour Truck Percentage Calculated from Project TMC

	Date	Type	AM*	PM*	Peak Hour	
					Average	Rounded Up
SW 10th Street						
West of Powerline Road	3/9/2016	TMC	1.77%	1.33%	1.5%	2%
Between Powerline Road and NW 28th Avenue	3/9/2016	TMC	2.20%	1.38%	1.4%	2%
Between NW 28th Avenue and Military Trail	3/9/2016	TMC	2.09%	1.45%	1.8%	2%
Between Military Trail and Newport Center Drive	3/9/2016	TMC	1.33%	1.62%	1.5%	2%
Between Newport Center Drive and I-95	3/9/2016	TMC	1.97%	0.85%	1.4%	2%
Between I-95 and Natura Boulevard	3/9/2016	TMC	1.09%	0.73%	0.9%	1%
East of Natura Boulevard	3/9/2016	TMC	1.23%	0.43%	0.8%	1%

*Calculated by averaging the truck percent from all movements to/from segment from TMC truck percentages within or at end of segment.

Figure 2.13
Publix Distribution Center – AM and PM Peak Hours

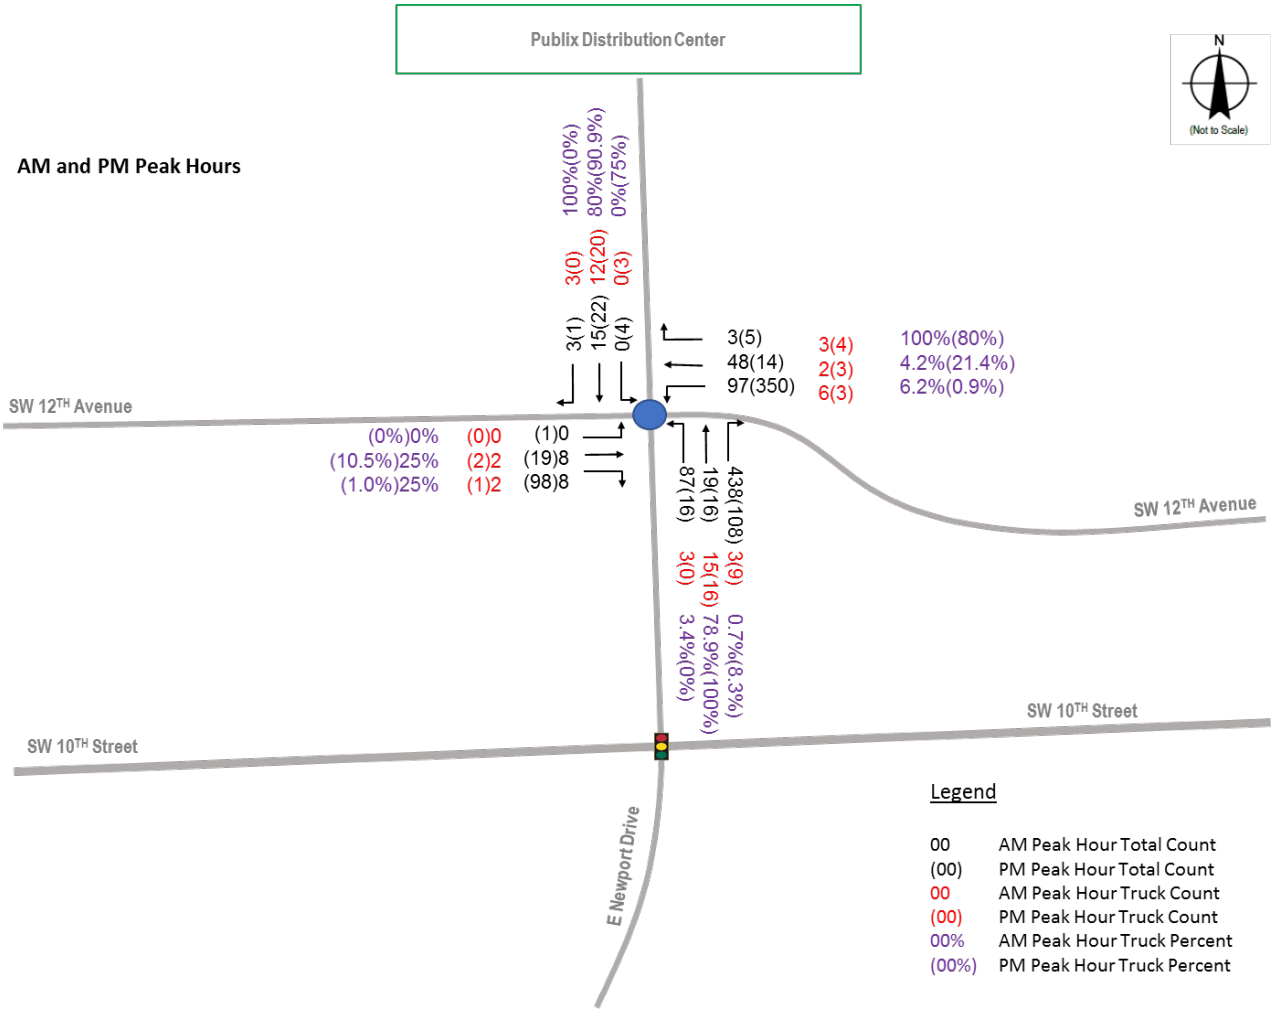


Figure 2.14
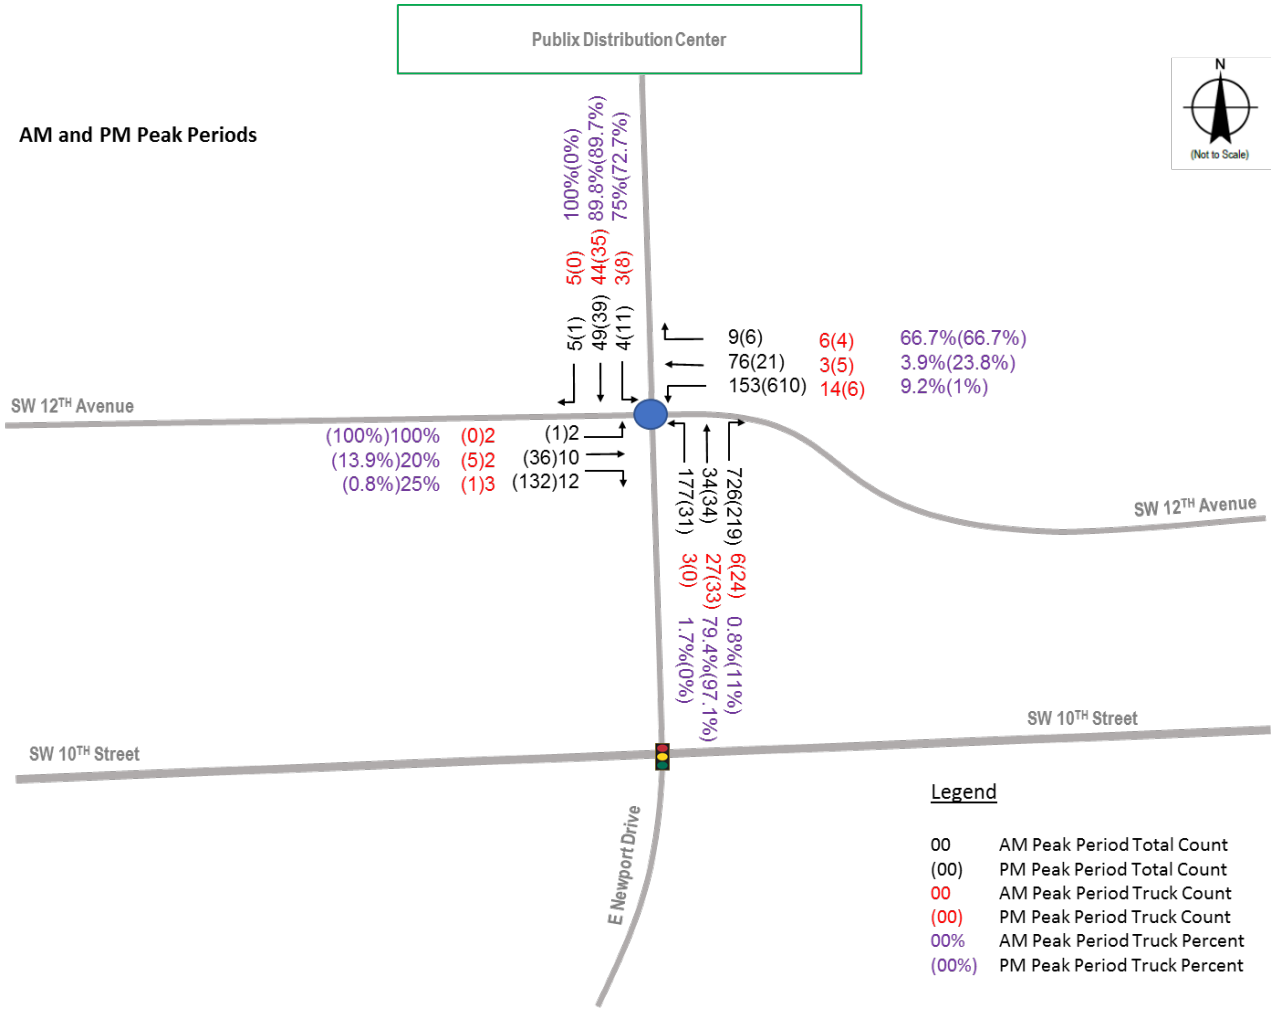
Publix Distribution Center – AM and PM Peak Periods



2.4 PEAK PERIOD TRAFFIC

As described in **Section 2.2.1**, peak period turning movement counts were conducted at intersections in the study area and were adjusted. For each intersection, the highest overall volume hour in the AM peak and PM peak periods were used and seasonal factors applied. The volumes were then balanced between the intersections using the SW 10th Street/Powerline Road intersection as the control point. The most common peak hours on SW 10th Street are:

- AM Peak = 7:30 AM – 8:30 AM
- PM Peak = 5:00 PM – 6:00 PM

Figures 2.15 through **2.20** depict AM peak hour and PM peak hour volumes.

Figures 2.21 through **2.23** depict existing lane geometry for the corridor.

3.1 INTERSECTION ANALYSIS

The focus of the existing operational analysis is the roadway capacity and intersection analysis. The traffic operations analysis for the roadway segments are based on *2010 Highway Capacity Manual* (HCM) methodologies. As noted earlier, SW 10th Street exceeds the four-lane LOS D capacity on a daily basis and LOS E capacity during the peak periods.

Intersections were analyzed using Synchro software (Version 9.2, Build 914, Revision 6). The analysis was performed with existing turning movement volumes, intersection lane configurations, and existing signal timing plans, as of September 2016.

The results of the existing unsignalized intersection analysis on SW 10th Street and its cross streets are provided in **Table 3.1**. Results show unacceptable operations at four unsignalized intersections along SW 10th Street.

Table 3.1
Existing 2016 SW 10th Street Unsignalized Peak Hour Intersection Analysis Results

Main Roadway	Cross Street	LOS (Delay)	
		AM	PM
SW 10th Street	Industrial Park	A (7.8)	F (347.9)
	SW 30th Avenue	F (165.7)	F (372.4)
	SW 24th Avenue	F (120.4)	F (114.2)
	Driveway east of SW 24th Avenue	A (2.9)	F (197.6)
	Driveway west of South Military Trail	A (1.6)	A (2.0)
South Military Trail	East Drive	A (0.7)	A (0.6)
	Lakes at Deerfield	A (1.2)	A (1.0)
	Horizon Club	A (2.4)	D (29.3)
Newport Center Drive	SW 12th Avenue	A (4.2)	B (11.0)
Powerline Road (S.R. 845)	Quiet Waters North	A (0.1)	A (0.4)
	Quiet Waters South	A (0.4)	A (0.1)
	American Way	A (0.9)	A (0.5)

Notes: **F (##.#)** = Level of Service (LOS) E or F, reflecting unacceptable/failing operations
Delay is in seconds/vehicle

The signalized intersection analysis of the Sawgrass Expressway, SW 10th Street, Florida's Turnpike, and I-95 is summarized in **Tables 3.2** through **3.9**. Results for signalized intersections along SW 10th Street indicate that the Powerline Road, South Military Trail, and I-95 northbound ramps intersections operate at or over capacity (LOS E or LOS F) in both peak hours.

The Synchro analysis is provided in **Appendix B**.

Table 3.2

3.2 STUDY AREA OPERATIONS

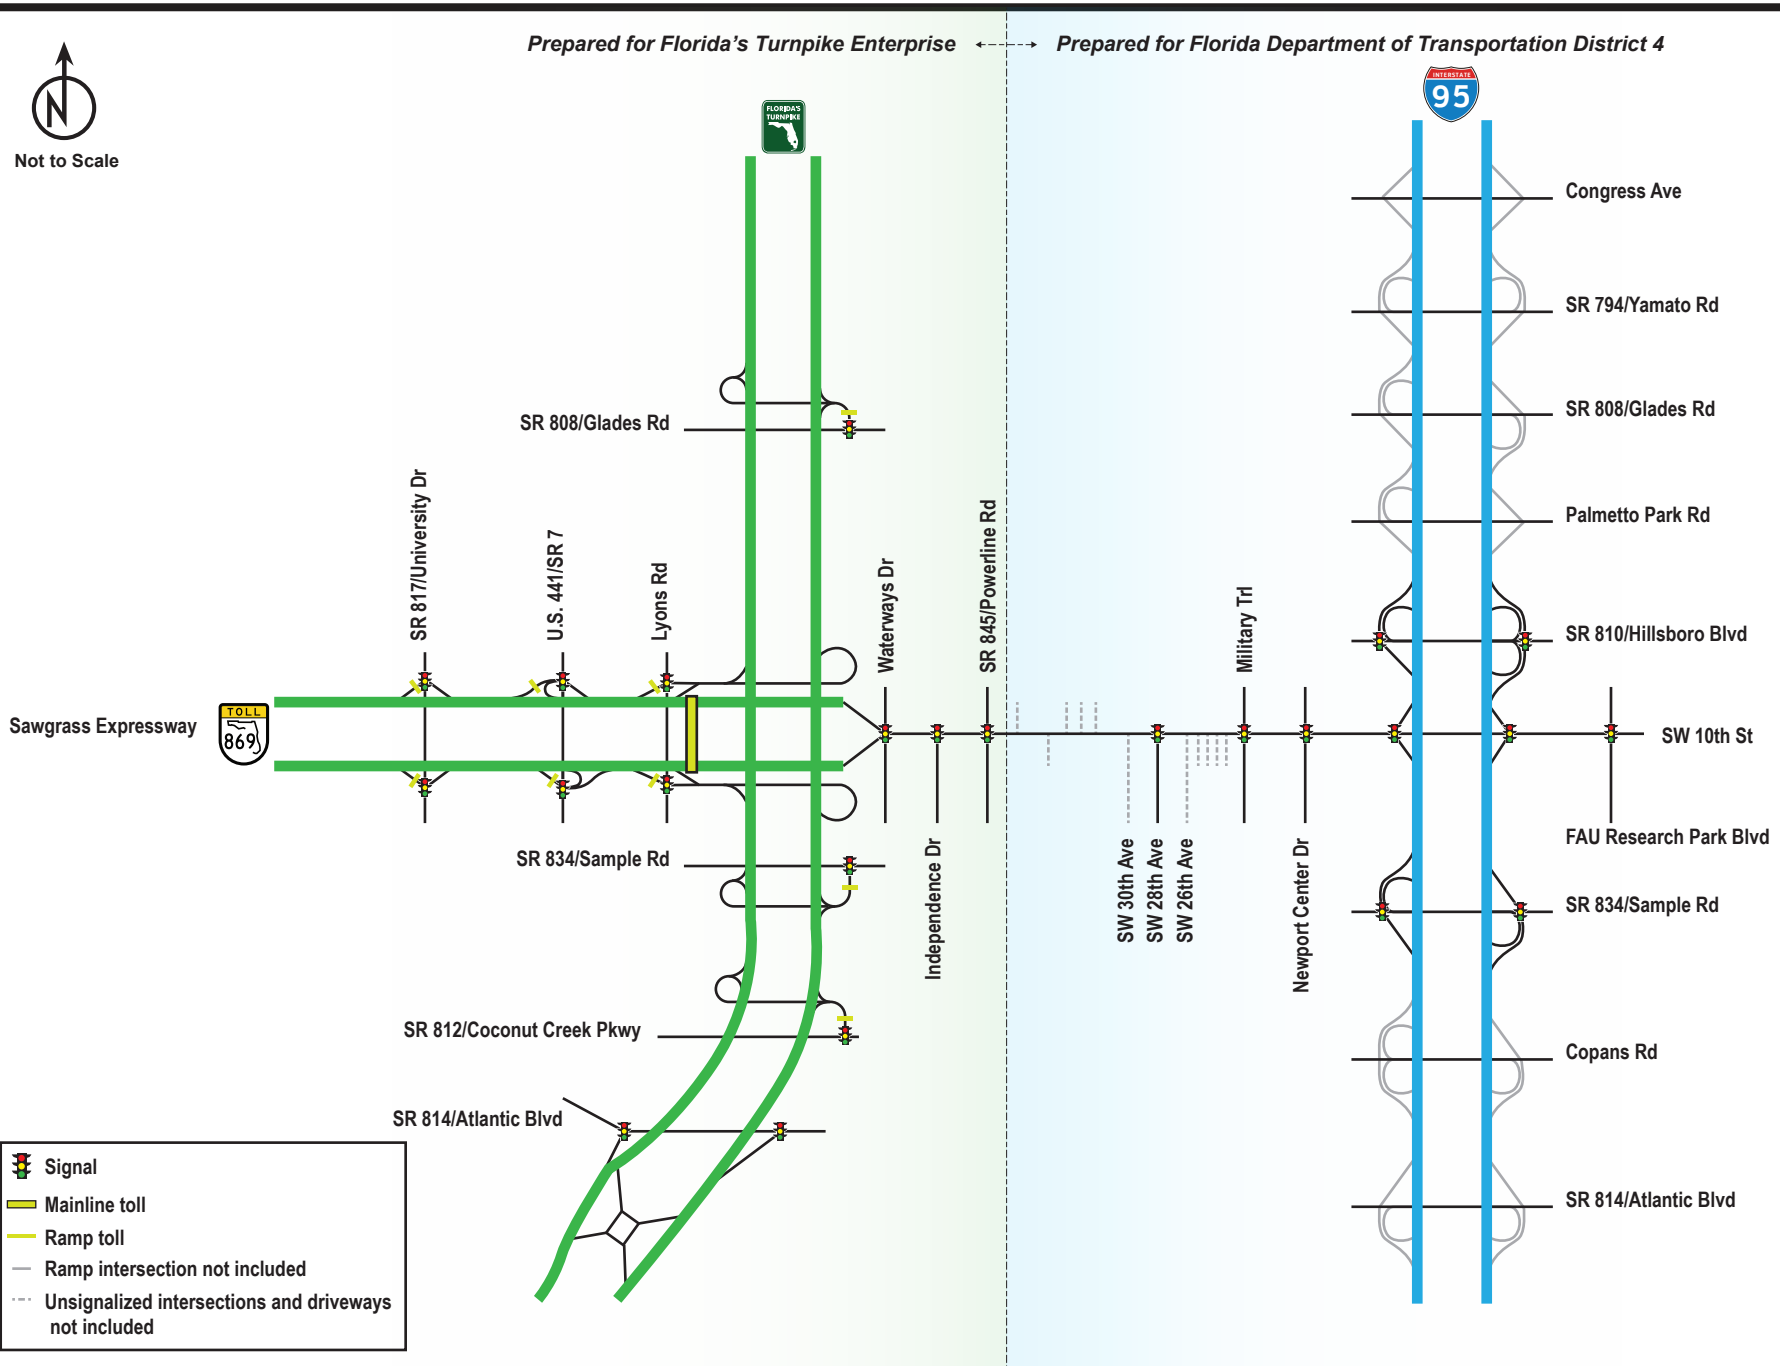
VISSIM microsimulation will be used to provide measures of effectiveness (MOEs) to compare improvement options for SW 10th Street. Therefore, an existing conditions VISSIM model of the study area is under development. The initial task includes reviewing the available data, models, and analysis results from the other recent studies.

FDOT District 4 has developed VISSIM models for I-95 as part of the 95 Express Phase 3 project. VISSIM models are also being developed by FTE for the Sawgrass Expressway and Turnpike Mainline. These models were merged into a new VISSIM file and the missing SW 10th Street roadways and I-95 network elements were added. The VISSIM model study area is shown on **Figure 3.1.**

Twenty-four signalized intersections have been coded for the existing conditions VISSIM model. The nine signalized intersections along SW 10th Street are:

- Independence Drive
- Powerline Road
- Waterways Drive
- South Military Trail
- SW 28th Avenue
- Newport Center Drive
- I-95 Southbound off-ramp
- I-95 Northbound off-ramp
- FAU Research Park Boulevard

The *Calibration Report* is provided in **Appendix C**.



FDOT

SW 10th Street PD&E Study
Project Traffic Forecast Memorandum

VISSIM Model Study Area

Figure 3.1

FLORIDA'S TURNPIKE

The project traffic forecasts for this study were developed through a multi-step process. With the need to estimate dynamically tolled express lane traffic for the Build scenario, the SW 10th Street study used two modeling tools:

- Travel demand model
- Express Lanes Time-of-Day Model

Forecasted AADT and EL hourly traffic were derived from these two models. This information was used to derive future year directional design hour traffic (DDHV). Model-generated origin-destination trip matrices also provided inputs to operational simulation models for the No-Build and Build scenarios.

For the travel demand modeling effort, the study used the FTE version of the Southeast Regional Planning Model (SERPM-FTE) 6.5.4, which has been used for various studies, including the I-95 Express Lanes Traffic and Revenue study and the Sawgrass Expressway Widening PD&E study. The SERPM covers a three-county region in Southeast Florida: Palm Beach, Broward, and Miami-Dade. SERPM-FTE includes model network enhancements such as the recoding of interchange configurations along the major freeway networks in Southeast Florida and updates to the future land use data to reflect the best known information at the time. The SERPM produces travel demand forecasts at a daily level and by three time periods: AM Peak (6:30 AM – 9:30 AM), PM Peak (3:30 PM – 6:30 PM), and off-peak (remainder of the day).

The ELToD model works in conjunction with the SERPM and is designed to take daily and peak period subarea trip tables and produce traffic estimates by hour, by direction, for both the general purpose lanes (GPLs) and ELs for each roadway segment. The model is considered state-of-the-practice for forecasting travel demand on Express Toll lanes in Florida.

4.1 MODEL VALIDATION

The model development for this project consisted of enhancing the local subarea by recoding intersection configurations, splitting Traffic Analysis Zones (TAZs), and adding local streets important to local circulation around the study corridor. As shown on **Figure 4.1**, the model subarea encompasses the area in three study corridors:

- Florida's Turnpike between Lake Worth Road and Atlantic Boulevard
- I-95 corridor between Congress Avenue and Atlantic Boulevard
- Sawgrass/SW 10th Street corridor between University Drive and Natura Boulevard

Within the subarea, the highway network coding was reviewed and corrected as needed using aerial imagery. The SERPM was validated to 2010 traffic conditions in an iterative fashion by first adjusting link speeds at the regional level using the Cube Analyst process at the subarea level.

Figure 4.1
Subarea Model Network

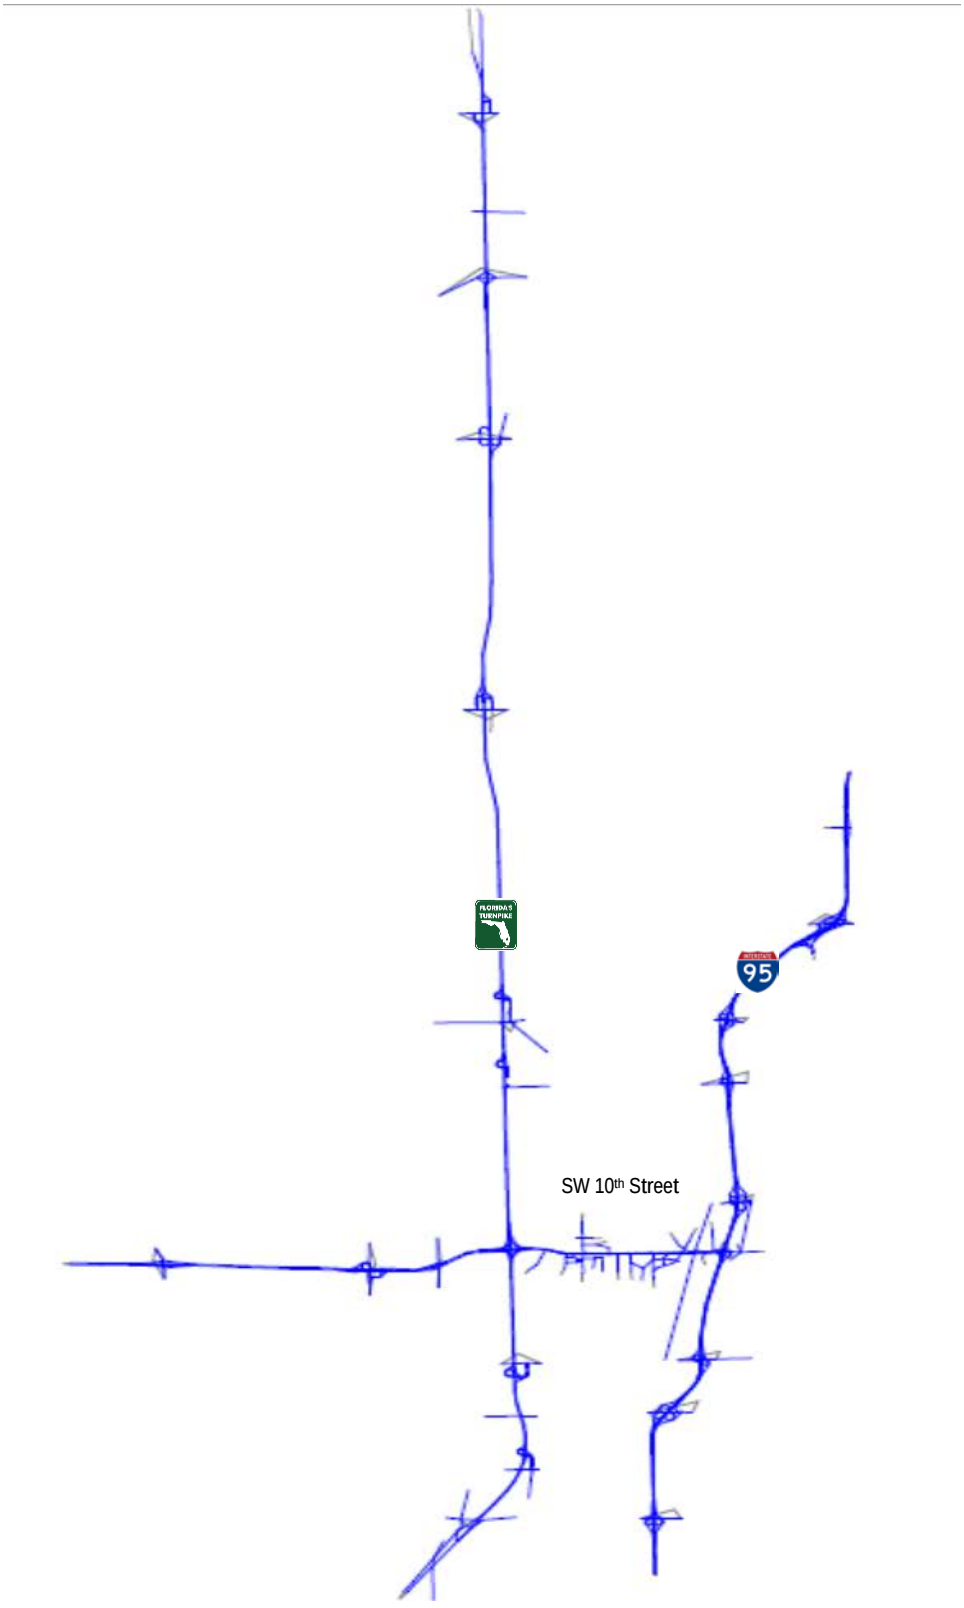


Table 4.1 shows the model performance statistics on a daily level by volume ranges for the three-county region. Since the focus of validation for this project was at the subarea level, the project team did not make significant changes to the model at the regional level. However, the overall volume-to-count (VC) ratio for the SERPM region is 1.0, indicating a good match. The VC ratios on the major roads (volume greater than 10,000), except for one category, are within 10 percent deviation, which is the acceptable range of variation for the project. Root mean square error (RMSE) statistics showed larger variations than acceptable ranges, but they were significantly improved at the subarea level using the Cube Analyst process as described below.

Table 4.1
RMSE and Volume-to-Count Ratio by Volume Range – Region

Volume Range	Acceptable RMSE Range	Region		
		Number of Links with Counts*	RMSE	VC Ratio
1 to 5,000	45 - 55%	938	123%	1.37
5,000 to 10,000	35 - 45%	1,423	58%	1.10
10,000 to 20,000	27 - 35%	2,080	39%	1.02
20,000 to 30,000	24 - 27%	946	30%	0.93
30,000 to 40,000	22 - 24%	172	28%	0.93
40,000 to 50,000	20 - 22%	60	31%	0.83
50,000 to 60,000	18 - 20%	35	27%	0.93
60,000 to 70,000	17 - 18%	24	27%	0.91
70,000 to 80,000	16 - 17%	83	19%	1.00
80,000 to 90,000	15 - 16%	29	21%	1.03
90,000 to 100,000	14 - 15%	22	20%	0.97
100,000 to 500,000	< 14 %	60	20%	0.93
Overall	**32 - 39%**	**5,872**	**41%**	**1.00**

*Represents one-way model links with traffic counts in the specified volume range

Table 4.2 shows VC ratio statistics on a daily level by facility type for the three-county region. All facility types are within the acceptable range of variations.

Table 4.2
Volume-to-Count Ratios by Facility Type

FT Group	Facility	Volume	Count	VC Ratio	Number of Links with Counts*
1	Freeways	21,125,619	21,441,016	0.99	294
2	Uninterrupted Roadways	2,051,326	1,980,656	1.04	209

Overall		**96,142,899**	**96,488,859**	**1.00**	**5,872**

*Represents one-way model links with traffic counts for the specified facility group

A Cube Analyst process was used at the subarea level to adjust the origin-destination matrices to obtain a better correlation between observed counts and model estimates. The Cube Analyst process is a matrix estimator that uses a seed origin-destination matrix along with link level traffic counts to develop an origin-destination matrix in an iterative fashion that corresponds to model-estimated volumes which closely match the provided link counts. The Cube Analyst process for this project consisted of the following steps:

- A subarea network consisting of only mainline and interchanges of study corridors (shown in **Figure 4.1**) was extracted from the regional model network.
- Using subarea assignment process in Cube, origin-destination matrices representing the subarea were extracted for three time periods, which were used as seed matrices in the Cube Analyst process.
- Within the Analyst step, three separate Analyst estimation processes were developed for the AM Peak Subarea Assignment, PM Peak Subarea Assignment, and Off-Peak Subarea Assignment, respectively.
- Traffic counts were processed for AM, PM, and Off-Peak periods for 2010 conditions and were coded on the appropriate links.
- An iterative feedback loop between highway assignment and Cube Analyst was performed until satisfactory RMSE and VC ratio statistics were obtained.
- Subarea-level and link-level validation statistics were evaluated.

- A reasonableness check, for selected origin-destination pair groups, between the adjusted origin-destination tables and observed Bluetooth origin-destination data was made and additional adjustments were applied manually to origin-destination tables and fed back to the Cube Analyst process.

Tables 4.3 through **4.5** provide RMSEs and VC ratios by volume ranges for the subarea for three time periods before and after Cube Analyst adjustments. The RMSE statistics, which signify the model estimate variation from observed counts, with Cube Analyst adjustments, are significantly improved for each volume range. These improved origin-destination tables were used in the project forecasting process.

The adjustments to origin-destination tables by the Cube Analyst process were calculated by subtracting the original subarea origin-destination table from the adjusted origin-destination table by time period. This adjustment (also known as validation Delta) was applied to the future year model estimated origin-destination tables. As large regional models such as SERPM are validated using the regional level statistics, they do not generally produce good results for specific corridor or links. Cube Analyst type adjustment to origin-destination tables and application of adjustments to future year model estimated origin-destination table is acceptable for project traffic forecasting models.

Table 4.3
RMSE and Volume-to-Count Ratio by Volume Range – Subarea – AM

Volume Range	Acceptable RMSE Range	Number of Links with Counts	Subarea before Analyst		Subarea after Analyst	
			RMSE	VC Ratio	RMSE	VC Ratio
1 to 5,000	45 - 55%	198	36%	0.98	10%	0.98

Tables 4.6 through **4.8** provide VC ratio statistics by Roadway Type (Facility Type) at the subarea level before and after using the Cube Analyst process. Numbers highlighted in pink denote a ratio with 10 percent or larger difference from 1.0. For example, in **Table 4.6**, there are four facility groups in the subarea before Analyst with VC ratios higher than 1.1 or lower than 0.9. The Analyst process showed improved VC ratios in all four ranges while the VC ratio worsened for one FT group (HOV).

Table 4.6

4.2 SOCIOECONOMIC DATA

Socioeconomic (SE) data are extremely important in producing accurate traffic forecasts, as future traffic demand is derived from these data. To provide reasonable traffic forecasts, the model must begin with up-to-date base year data. From this base year data, future year SE data and future traffic forecasts are then developed.

The SE data used in the SW 10th Street project are the culmination of a few studies conducted using the SERPM-FTE model over the last few years. These studies include the I-95 Phase 3 Traffic and Revenue Study and the recently completed Sawgrass Widening PD&E study. For each study, local land use data were collected, reviewed, and incorporated in the SERPM model TAZ database. The

process of developing SE data for the SW 10th Street project is briefly described in this section. A detailed description of this process is included in **Appendices D** and **E**. **Appendix D** includes the Land Use Assessment Report for the I-95 Phase 3 Traffic and Revenue study, while **Appendix E** includes a similar report for the Sawgrass Expressway Widening PD&E study.

The SW 10th Street project model, which was built upon the Sawgrass PD&E Model, includes the most recent SERPM 7 socioeconomic data (version 7.062). The important SE data variables, such as population, households, and employment data from SERPM 7, were converted to the SERPM 6.5.4 FTE format. Since the TAZ system of the SERPM 6.5.4 and SERPM 7 are different in many parts of the region, micro-analysis zone (MAZ) level data from SERPM 7 were aggregated into the SERPM 6.5.4 TAZ system using GIS tools.

The SE data development process included additional assessments to update the SE data after a review of existing land uses, findings from a review of the Bureau of Economic and Business Research (BEBR) data, and developments of regional impact (DRIs) and large sub-DRIs (residential and non-residential developments with either 120+ dwelling units or over 50,000 square feet of non-residential land use).

Existing Land Use

The existing land use around the SW 10th Street project corridor is depicted on **Figure 4.2**. This figure illustrates that the immediate vicinity of the SW 10th Street corridor, between the Turnpike and I-95, and areas to the east of I-95 are largely developed. There are not many large vacant tracts of land available for development in this region.

Developments of Regional Impacts (DRI) Data Collection Method

The land use data collection was performed in multiple steps. The available data were compiled and then additional inputs and clarifications from the regional planning staff and local government staff responsible for overseeing DRI/sub-DRI development were sought. This provided insight and understanding of the conditions associated with individual DRI projects and information on other development and local initiatives regarding future land use changes within the study area.

The data compiled and considered in the evaluation include DRI information provided by the two regional planning councils; Department of Economic Opportunity DRI records; Sub-DRI larger scale residential, non-residential, and mixed-use projects reported by the local jurisdiction (i.e., Planned Unit Developments [PUDs]); local college/university campus Master Plans and Redevelopment plans; and overlay districts potentially impacting future year development, such as Community Redevelopment Areas (CRAs), Transit Oriented Corridors (TOCs), Regional Activity Centers (RACs), and Local Activity Centers (LACs).

Figure 4.3 shows locations of DRIs that were evaluated along the I-95 and Sawgrass corridors that may impact traffic demand on the project corridor.

Socioeconomic Update Methodology

Considering data resources, local jurisdictional input, and aerial reconnaissance, a spreadsheet was developed summarizing each development, overall totals, and three model scenarios (2010, 2020, and 2040). Each development was identified by name, location/jurisdiction, relationship of the development location to the model TAZs structure, square footage by timing/phasing, land use type (e.g., residential, industrial, commercial, institutional), current development status, and projected population and employment.

Since the base year of the SW 10th Street project model is 2010, converted SERPM 7 SE data were checked for accuracy against several sources, including census data. DRI and Sub-DRI information collected was verified using aerial reconnaissance to confirm that actual built levels of the built-out DRIs were reasonable when compared to approved levels and development documentation. This approach provided the best available information for establishing base year conditions and input to future development forecasts.

Once DRI and other land use information was incorporated in the base year 2010, future year 2020 and 2040 socioeconomic TAZ-level data were adjusted to match the county-level control totals using BEBR medium projections. Zonal data with negative TAZ growth in population or employment between 2010 and 2020 and between 2020 and 2040 were further reviewed and resolved in an iterative fashion.

County-level Control Totals

Tables 4.9 and **4.10** provide a county-level population and employment forecasts comparison between the SW 10th Street project model (SERPM FTE) and SERPM 7. As expected, county-level totals compare well between these two datasets.

Table 4.9
Population Comparison between SERPM FTE and SERPM 7

County/Source	SERPM FTE		SERPM 7.062	
	2010	2040	2010	2040
Palm Beach	1,307,000	1,689,000	1,327,000	1,712,000
Broward	1,731,000	1,992,000	1,748,000	1,994,000
Miami- Dade	2,476,000	3,289,000	2,516,000	3,308,000
Total	**5,514,000**	**6,970,000**	**5,591,000**	**7,014,000**

Table 4.10
Employment Comparison between SERPM FTE and SERPM 7

County/Source	SERPM FTE		SERPM 7.062	
	2010	2040	2010	2040
Palm Beach	638,000	860,000	638,000	851,000
Broward	863,000	956,000	871,000	922,000
Miami- Dade	1,125,000	1,670,000	1,125,000	1,637,000
Total	**2,626,000**	**3,486,000**	**2,634,000**	**3,410,000**

Population and Employment Growth around Study Corridor

Once the TAZ-level socioeconomic database was updated, reviewed, and finalized, future SE data forecasts were compared with the base year 2010 to understand the change in population and employment around the project corridors. **Figure 4.4** depicts the population growth between 2010 and 2040. **Figure 4.5** provides a comparison of employment data at the TAZ level between 2010 and 2040. A 5-mile buffer around the study corridor is also shown on these figures.

Table 4.11 lists the population and employment forecasts within the 5-mile buffer around the SW 10th Street study corridor. Population and employment are expected to grow at approximately 0.4 percent and 0.3 percent annually, respectively, between 2010 and 2040. This is consistent with the largely developed nature of the region within this buffer.

Table 4.11
Population and Employment Forecasts within 5-Mile Buffer of Study Corridor

Variable/Year	2010	2040	Change	AAGR
Population	426,700	482,800	56,100	0.4%
Employment	211,600	234,300	22,700	0.3%

	SW 10th Street PD&E Study Project Traffic Forecast Memorandum	2040 - 2010 Population Difference	Figure 4.4

	SW 10th Street PD&E Study Project Traffic Forecast Memorandum	2040 - 2010 Employment Difference	Figure 4.5

4.3 FUTURE YEAR MODEL NETWORKS

Future year models were developed for years 2020 and 2040. The future year highway networks prepared for the Sawgrass Widening PD&E study were modified with enhancements made during the base year model development and validation.

For the purposes of this study, there are three primary travel demand forecast alternatives.

No-Build

This alternative assumes that capacity will be in place for the following corridors:

- Sawgrass Express Lanes
- Turnpike Mainline Express Lanes
- 95 Express Lanes

The 2020 No-Build network also represents existing plus committed (E+C) roadway capacity improvements for the surrounding area, while the 2040 No-Build network includes Cost Feasible roadway projects in the Broward and Palm Beach long-range transportation plans. Figures 4.6 through 4.8 depict No-Build lane geometry for the corridor and the limits of the express lanes.

Tables 4.12 and 4.13 provide existing lanes and network capacity improvement assumptions in the 2020 and 2040 model network for regional limited-access facilities and local arterials within the vicinity of the study area.

Partial-Build

In addition to the No-Build improvements, the Partial-Build alternative assumes:

- Full Interchange at Turnpike Mainline/Sawgrass Expressway/SW 10th Street
- Modification of the I-95/SW 10th Street interchange to (1) provide a single intersection for the southbound ramps and (2) add a frontage road for the northbound on-ramp at SW 10th Street and the northbound off-ramp to Hillsboro Boulevard, resulting in a reduction of one general use lane from SW 10th Street to Hillsboro Boulevard.
- Direct Connections to northbound and southbound 95 Express

This alternative assumes that the 95 Express direct-connect ramps will extend west of Military Trail via grade-separated ramps. In addition, the full interchange at Turnpike Mainline/Sawgrass Expressway connects to an at-grade SW 10th Street arterial. SW 10th Street remains as an arterial between Powerline Road and Military Trail, but could either remain as the existing four lanes or be widened. Based on the travel demand model runs, the volumes along SW 10th Street between Powerline Road and Military Trail are well over the four-lane capacity under this forecast scenario. Figures 4.9 through 4.11 depict Partial-Build lane geometry for the corridor.

Build

The location and selection of ingress/egress points are a critical component of the Build options evaluation process. The express lane ingress/egress points for this project were evaluated through an iterative evaluation of system to system origin-destination movements, geometric requirements, operational analysis, signing and tolling considerations. As part of the Sawgrass Widening PD&E Study, Options 3A through 3F at the Turnpike Mainline/Sawgrass interchange were evaluated through forecasting and operational analysis. Option 3D-1.1 was the recommended option for further study by the SW 10th Street PD&E Study team. Option 3A is provided in **Appendix G** since this Build option was previously submitted in the draft version of this Project Traffic Forecast Memorandum.

Through coordination with the SW 10th PD&E team, additional ingress/egress options were requested due to geometric issues with placing intermediate access between Powerline Road and Military Trail in Option 3D-1.1. Consequently, Options 3D-1.2 through 3D-1.6 were developed for further evaluation by the SW 10th Street PD&E team. Furthermore, the SW 10th Street PD&E team is evaluating an alignment with the express lanes in the center of the SW 10th Street arterial lanes and alignment with the express lanes positioned north of the SW 10th Street arterial lanes. The options are described herein for the center alignment are as follows:

Build Option 3D-1.1 (Center Alignment)

- Grade separated express lane in the center of SW 10th Street, which includes express lane overpass at all signalized intersections.
- Intermediate express lane ingress and egress in both directions between Powerline Road and Military Trail
- Same number of SW 10th Street arterial lanes that currently exist:
  - Six continuous arterial lanes between Sawgrass Expressway and Powerline Road
  - Four continuous arterial lanes between Powerline Road and Military Trail
  - Six continuous arterial lanes between Military Trail and I-95

Figure 4.12 provides the express lane diagram for Build Option 3D-1.1. The express lane diagram shows the ingress/egress ramps, near entry/exit ramp, toll gantry locations, destination signs and operational jurisdiction. The signs that will be operated and controlled by the District Four Traffic Management Center are outlined in green.

Toll Plan and Access Points - Build Option 3D-1.1

Figure
4.12

FLORIDA'S TURNPIKE

Build Option 3D-1.2 (Center Alignment)

Similar to Build Option 3D-1.1 with changes to express lane ingress and egress points along SW 10th Street, see toll plan in **Appendix G**.

- Express lane alignment in the center of the eastbound and westbound direction of SW 10th Street.
- An eastbound express lane ingress and egress are provided between Powerline Road and Military Trail; the express lane egress is followed by express lane ingress.
- A westbound express lane ingress and egress are provided between Military Trail and Powerline Road; the express lane egress is followed by express lane ingress.
- An additional westbound express lane ingress is provided between Newport Center Drive and Military Trail.

Build Option 3D-1.3 (Center Alignment)

Similar to Build Option 3D-1.1 with changes to express lane ingress and egress points along SW 10th Street, see toll plan in **Appendix G**.

- Express lane alignment in the center of the eastbound and westbound direction of SW 10th Street.
- An eastbound express lane ingress is provided between Powerline Road and Military Trail, followed by an eastbound express lane egress between Military Trail and Newport Center Drive.
- A westbound express lane ingress is provided between Newport Center Drive and Military Trail, followed by a westbound express lane ingress between Military Trail and Powerline Road.

Build Option 3D-1.4 (Center Alignment)

Similar to Build Option 3D-1.1 with changes to express lane ingress and egress points along SW 10th Street, see toll plan in **Appendix G**.

- Express lane alignment in the center of the eastbound and westbound direction of SW 10th Street.
- An eastbound express lane egress is provided between Powerline Road and Military Trail.
- A westbound express lane ingress is provided between Newport Center Drive and Military Trail, followed by a westbound express lane ingress between Military Trail and Powerline Road.

Build Option 3D-1.5 (Center Alignment)

Similar to Build Option 3D-1.1 with changes to express lane ingress and egress points along SW 10th Street, see toll plan in **Appendix G**.

- Express lane alignment in the center of the eastbound and westbound direction of SW 10th Street.
- An eastbound express lane egress is provided between Military Trail and Newport Center Drive.
- A westbound express lane ingress is provided between Newport Center Drive and Military Trail, followed by a westbound express lane egress between Military Trail and Powerline Road.

Build Option 1.6 (Center Alignment)

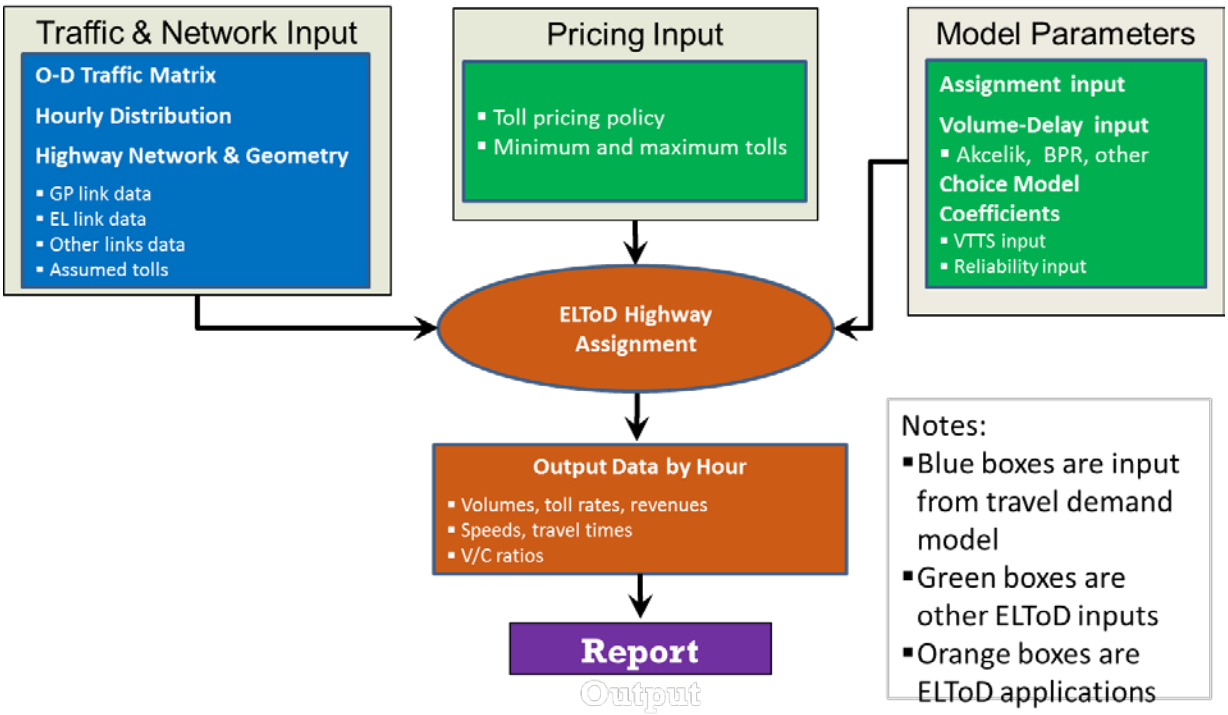
Similar to Build Option 1.1 Center Base without express lane ingress and egress points along SW 10th Street, see toll plan in **Appendix G**.

4.4 EXPRESS LANE TIME-OF-DAY MODEL

An important aspect of the congestion management strategy of express lanes is the toll rates charged to users over the course of the day. The traffic level of service in the express lanes is maintained through variable pricing, with the express lane tolls rising with increased congestion in the express lanes. The Express Lanes Time of Day Model v2.2 provides the means to forecast traffic by hour and direction in the express lanes via supply and demand equilibrium processes.

In the overall modeling process to develop hourly traffic and revenue forecasts, the first step is feeding the data derived from the Turnpike's version of the Southeast Regional Planning Model (SERPM), into the ELToD Model. Since the SERPM produces peak period traffic forecasts, the ELToD Model is necessary in order to produce hourly traffic forecasts for the general use lanes and express lanes. The ELToD Model works in conjunction with the demand model and was designed to utilize a subarea trip matrix and network extraction from the SERPM. This process produces traffic and toll estimates by hour and by direction, for both the general use and express lanes. **Figure 4.13** illustrates the ELToD Model process, inputs and outputs.

Figure 4.13
ELToD Model Flow Chart



In addition to a set of three period subarea trip matrices, the ELToD Model used hourly traffic distribution on the Sawgrass Expressway, Southern Coin, and I-95 by direction from count data; the geometric configuration of the proposed express lanes; and a toll policy pricing curve. For this study, two directional hourly traffic distributions were used to represent the corridor in the model, shown in **Table 4.14**. The pricing policy is graphically represented in **Figure 4.14** for both minimum tolls used in this study. The ELToD Model was developed for years 2020 and 2040 of the project corridor.

General Model Assumptions:

- Model Years: 2010 Base, 2020 and 2040 Future
- Opening Year: 2020
- Dynamically priced express lanes
- Minimum Toll:
  - $0.25 per segment for the Turnpike facilities – Sawgrass Expressway and Turnpike Mainline
  - $0.50 per segment for non-Turnpike facilities (SW 10th Street to the east of Military Trail and I-95)
- Maximum Toll:
  - $5.00 per segment for both Turnpike and non-Turnpike facilities
- Buses:
  - Do not pay the dynamic toll on the Turnpike system, however, they do pay the SunPass general toll of the adjacent tolled lane (the FTE portion of this project)
  - Do not pay the express lanes toll on non-Turnpike system express lanes (the FDOT District Four portion of this project)
- No Trucks are permitted in express lanes

Table 4.14
ELToD Traffic Distribution by Period by Hour

Hours	Period	Turnpike		I-95	
		NB	SB	NB	SB

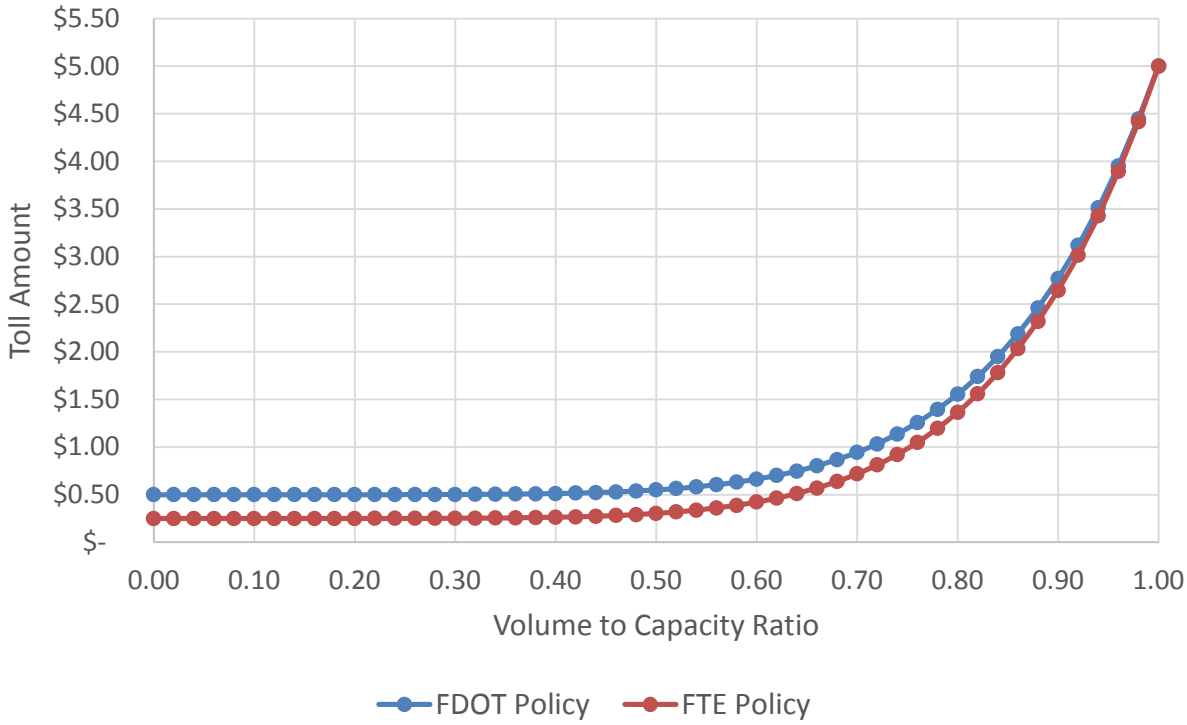
24		2.7%	2.4%	3.0%	2.6%

Figure 4.14
Express Lanes Pricing Policy Curves



The ELToD Model holds the daily traffic and hourly distribution constant (i.e., ELToD does not simulate peak spreading) but estimates the split that will occur between the general use and express lanes, given the distribution. It does this by solving for the supply/demand equilibrium of each hour. The supply side is represented by Akcelik volume-delay curves that estimate the segment travel times separately for the general use and express lanes in each direction. These curves are based on queuing theory to more accurately represent congestion levels in overcapacity conditions. Hourly toll rates are computed by direction based on the volume-to-capacity ratio in the express lanes in relation to a specified toll policy, and are maintained within the specified highest and lowest toll limits. It should be noted that for the Turnpike express lanes, a pricing policy representing the current 95 Express was chosen. ELToD develops the express lane share of traffic by hour based on the toll amount and the differences in travel times between the general use lanes and express lanes. The share calculations are done by applying the discrete toll choice model equation and calibrated coefficients. Also, general use lanes may be either non-express lanes in an existing interstate corridor or non-express toll lanes in an existing tolled corridor.

4.5 ELTOD CHOICE MODEL

A key feature in ELToD is the toll choice model equation that predicts express lane share origin-destination (O-D) pair based on:

- Time: Time enters the choice model as the weighted time from using the express lanes minus the weighted time from using the general use lanes.
- Toll: Toll enters the choice model as the toll paid from using the express lanes minus the toll paid from using the general use lanes. If the general use lanes are toll free, this expression is simplified to the express lanes toll minus zero.
- Reliability: Reliability enters the choice model as the standard deviation of travel time from using the express lanes minus the standard deviation of travel time from using the general use lanes. (Note that travel time weights are not used for measuring reliability.)
- Toll Constant: The constant captures fixed or aggregate effects based on the network, time-of-day, or traveler characteristics. The Toll Constant can account for willingness to choose the express lanes with no time or reliability benefits, such as to avoid large trucks.

The differences in travel time and reliability result primarily from the congestion in the general use lanes. For facilities with conventional general use lanes, the toll is non-zero only on the express lanes and the amount of toll is determined dynamically based on congestion levels in the express lanes. In an iterative process, the ELToD model calculates the express lanes share, assigns traffic to the general use and express lanes, and then updates the measures for time, toll, and reliability based on the average traffic flow across all iterations.

The iterative process continues until convergence. The (model calculated) values for time, toll, and reliability are generally highest during the peak periods. For many origin-destination pairs, time and reliability grow faster than the toll as congestion increases, causing the (model calculated) express lanes share to reach its maximum value during one of the peak periods. For each eligible origin-destination pair, the express lanes share in the ELToD model can be calculated from the following choice model equation:

$$Express\ Lane\ Share = \frac{1}{1 + e^{(-1 * (\beta_Constant + \beta_Time * Time + \beta_Toll * Toll + \beta_Reliability * Reliability))}}$$

- **Toll Constant (β_Constant)**: This parameter determines the express lane share when time, toll, and reliability have a net zero effect.
- **Time Coefficient (β_Time)**: This parameter is for the travel time coefficient in the choice model equation defined in the ELToD Model as the **Travel Time Coefficient** (with units of 1/min). This is the disutility of increasing travel time by one minute.

- **Cost Coefficient (β_Toll)**: This parameter is for the toll cost coefficient in the choice model equation defined in the ELToD Model as the **Toll Coefficient** (with units of 1/$). This is the disutility of increasing the toll by one dollar.
- **Reliability Coefficient Ratio (β_Reliability)**: This parameter is the disutility of increasing the standard deviation of travel time by one minute. It can be calculated from a Reliability Ratio (defined in the ELToD Model documentation as the **Reliability Coefficient Ratio**) and the travel time coefficient. It indicates the disutility of one unit (one minute) of standard deviation.

"**β_Constant**," "**β_Time**," "**β_Toll**," "**β_Reliability**," are all estimated values. The latter three values determine the relative importance of time, toll, and reliability, while β_Constant has a fixed value. The measures for time, toll, and reliability represent the differences between these variables in the express lanes and the general use lanes. These calculation measures are represented by the general form of:

Measure = Express Lane Value - General Use Lane Value

Table 4.15 provides the choice model parameters for the Turnpike facilities (Turnpike Mainline/Sawgrass Expressway) and 95 Express. The 95 Express VTTS was obtained from the *95 Express Phase 3 and 4 Stated Preference Survey*. The Turnpike VTTS was obtained from the Integrated Congestion Pricing Project (ICPP) Stated Preference Survey conducted in South Florida. The reliability ratio was based on research from the SHRP2 C04 report, previous stated preference survey data for Turnpike facilities and observed 95 Express data. The hourly toll parameters were estimated from observed overnight shares and by calibrating the choice model to observed data on 95 Express Phase 1. The Turnpike hourly toll parameters were derived by applying a damping factor to the 95 Express hourly toll parameters, based on the perception of user bias towards express lane choice on existing toll roads. For the ELToD travel demand forecast, the 95 Express toll choice model parameters were used for the entire corridor. In VISSIM microsimulation analysis, however, the 95 Express toll choice model parameters were used for the I-95 and SW 10th Street corridor and the Turnpike Express toll choice model parameters were used for the Turnpike Mainline and Sawgrass Expressway corridor.

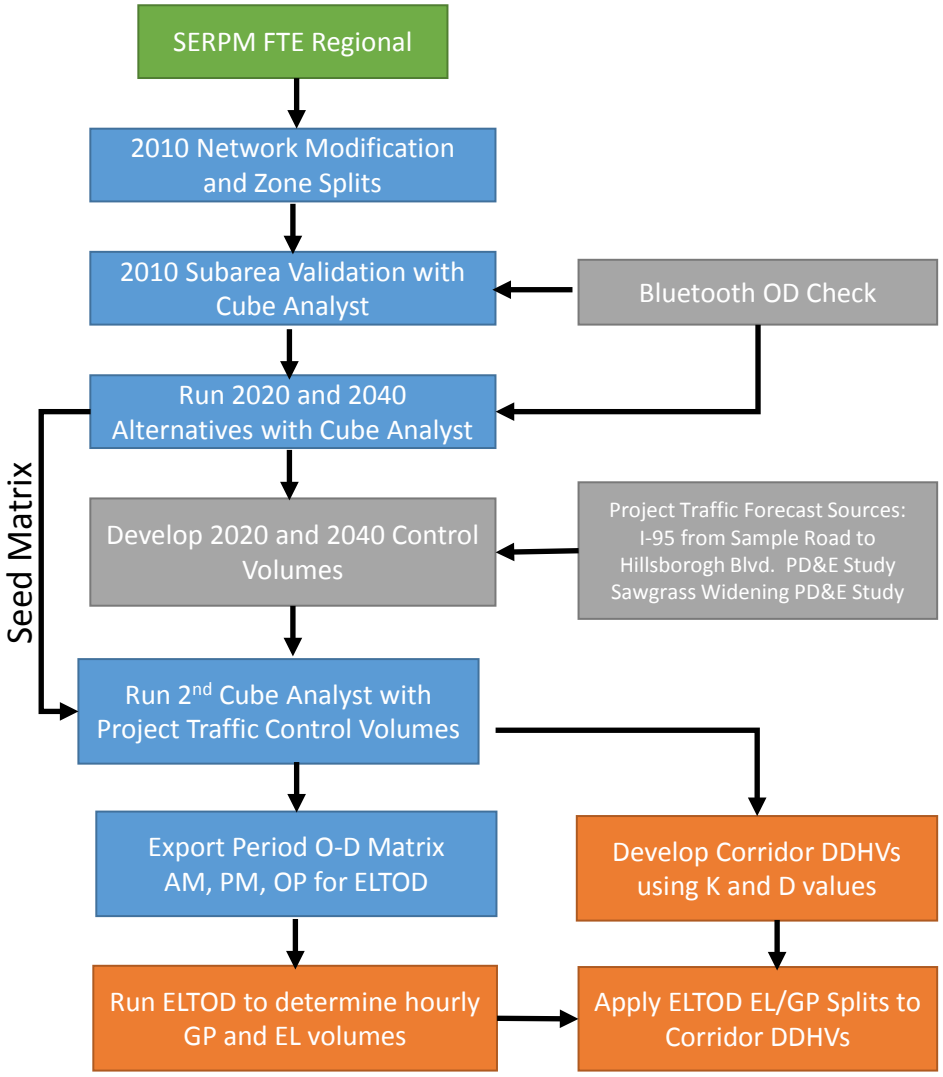
Table 4.15
Choice Model Parameter Comparison

Parameter	95 Express	Turnpike
Mean VTTS	$11.30	$9.62
Travel Time Coefficient	-0.112	-0.118
Toll Cost Coefficient	-0.5945	-0.736
Reliability Coefficient Ratio	2.65	0.90
Hourly Toll Parameters (peak)	-0.00	-0.647
Hourly Toll Parameters (off-peak)	-0.448	-1.095

5.1 FORECASTING PROCESS AND ASSUMPTIONS

The development of the project traffic forecast was a multi-step effort involving a combination of internal modeling procedures and post-model evaluation. **Figure 5.1** illustrates the process beginning with the regional SERPM-FTE. After the SERPM-FTE project model was validated against the 2010 traffic conditions, the future year model runs were conducted for the 2020 and 2040 No-Build, Partial-Build, and Build alternatives. An initial subarea model assignment was performed by applying the growth between the 2010 unadjusted matrices and the 2040 unadjusted matrices to the 2010 Cube Analyst adjusted matrices. The results of the future year Build scenarios were checked against the Bluetooth Origin-Destination data to see if the traffic between the Turnpike and I-95 Corridors that diverted to the SW 10th Street from the other interchanges on Florida's Turnpike, such as Sample Road and Glades Road, was reasonable.

Figure 5.1
Project Traffic Forecasting Process



The initial results for 2020 and 2040 for each scenario were then compared against the forecasts from two ongoing efforts: Sawgrass Expressway Widening PD&E study and the I-95 from Sample Road to Hillsborough Boulevard PD&E study. The I-95 PD&E study provided forecasts on I-95 mainline and ramps at the Sample Road, SW 10th Street, and Hillsboro Boulevard interchanges. The Sawgrass Expressway PD&E study provided traffic forecasts for the Sawgrass corridor from west of University Drive to east of Florida's Turnpike, as well as traffic forecasts on the Turnpike Mainline.

Base forecast volumes along the Sawgrass Expressway and Turnpike Mainline from the SW 10th Street project model were consistent with the Sawgrass Widening PD&E model projections, since only minor validation adjustments were made along the SW 10th corridor. The comparison against the I-95 PD&E study forecast indicated that SW 10th project model results were similar along SW 10th Street, but noticeably higher along I-95.

Because the No-Build scenario for the SW 10th Street PD&E study is the same as for the I-95 PD&E study, there is a need to achieve a consistent project forecast between the two projects. The forecast approach discussed with FDOT District 4 staff was to determine a project forecast for the No-Build scenario consistent with the I-95 PD&E study and pivot from these forecasts using the impacts identified from the SW 10th Street PD&E model. The methodology outlined in the *Traffic Data Collection and Traffic Projections Report* for the I-95 PD&E study was to apply a growth rate of 0.5 percent or SERPM 7.0 growth (whichever is greater) to the 2016 traffic volumes. Since the SW 10th Street I-95 study limits extend beyond the I-95 PD&E study limits (from Sample Road to Hillsboro Boulevard), a 0.5 percent growth rate was applied for the interchanges south of Sample Road, and the raw subarea SW 10th model results were used north of Hillsboro due to the impacts of the Spanish River Drive interchange.

Once the No-Build forecast was determined for 2040, the Partial-Build project forecast was determined by applying the model differences to the No-Build project forecast. For example, 2040 Partial-Build project traffic forecasts = 2040 No-Build project traffic + (2040 Partial-Build Model – 2040 No-Build Model). The Build project traffic was determined by taking the difference between the Partial-Build and Build model values and adding this impact layer to the Partial-Build project forecast. This process was also used to develop 2020 and 2040 Partial-Build and Build forecast volumes along I-95. A similar process was performed along the Sawgrass Expressway and Turnpike Mainline to achieve consistency with the Sawgrass Expressway Widening PD&E forecast.

Once project traffic forecast volumes were established as control values, a second Cube Analyst step was implemented to adjust the initial trip tables to match with the forecast values at selected links in the subarea. The final adjusted trip tables were assigned to the subarea networks for each scenario to produce the 2020 and 2040 forecasts on all links with and without control totals. Finally, the second Cube Analyst assignment results were checked, smoothed, and rounded to produce the project forecast AADTs.

The final forecasted AADTs from the subarea model, along with K-factors and D-factors, were used to develop corridor-level directional design hour volume (DDHV). For express lane locations, the

Subarea model peak period trip tables were then exported to ELToD to determine hourly traffic for the general purpose and express toll lanes.

5.2 ANNUAL AVERAGE DAILY TRAFFIC VOLUMES

The AADT volumes for each of the three scenarios are summarized and compared in the following tables to show the resulting annual growth rate between year 2020 and 2040 and to highlight the volume difference between the scenarios. **Table 5.1** shows the No-Build average growth by facility compared to historical trends and population/employment data within a 5-mile buffer of SW 10th Street. Segment-level forecast AADTs are shown for the Sawgrass Expressway, Turnpike Mainline, SW 10th Street, and I-95 in **Tables 5.2** through **5.5**. **Figures 5.2** through **5.4** show the AADT volumes for 2016, 2020, and 2040 for the three forecast scenarios.

Table 5.1
Facility Average Annual Growth Rate Comparison

Facility	2000-2015 Historical Trend	2016-2040 No-Build Forecast	2010-2040 SE Data TAZ 5-mile Buffer	
			Population	Employment
Sawgrass Expressway	2.8%	1.2%	0.4%	0.3%
SW 10th Street	0.7%	0.8%		
Turnpike Mainline	1.5%	1.7%		
I-95	-0.1%	0.6%		

A review of the AADT volumes indicates the following trends:

No-Build

- The portion of the Sawgrass Expressway within the study area shows average annual compound growth of 1.2 percent for the No-Build forecast. The Sawgrass Expressway is projected to have lower growth than historical trends indicate for the entire facility. The lower growth is due in part to the limited available capacity along SW 10th Street to feed the northern portion of the Sawgrass Expressway.
- SW 10th Street is anticipated to have growth similar to historical trends, although the corridor is capacity constrained.
- The Turnpike Mainline is anticipated to have higher growth than historical trends for the entire Southern Coin system due to the additional capacity with the planned widenings.
- I-95 has the lowest growth rate of the facilities, but the projected growth is expected to be higher than historical trends due to the added capacity from 95 Express.
- The I-95/Spanish River Drive interchange results in a diversion of traffic from the adjacent interchanges at Glades Road and Yamato Road, as expected with this reliever interchange.

Partial-Build

- The full interchange at Sawgrass Expressway and 95 Express direct connect ramps results in a shift of mainline traffic along both I-95 and the Turnpike.
- The prevalent movements appear to be Turnpike south to\from I-95 north, as they both increase with the Partial-Build.
- There is a noticeable reduction in traffic along I-95 south of SW 10th that has been shifted to the Turnpike.
- Reductions occur at Hillsboro Boulevard and Sample Road on I-95 due to a diversion to SW 10th Street.
- Reductions occur at the Sample Road and Glades Road interchanges on the Turnpike Mainline due to a diversion of traffic to SW 10th Street.
- There is a slight decrease in Sawgrass Expressway traffic due to a shift to the Turnpike Mainline.
- As expected, traffic along SW 10th Street increases with the new access.
- There is some reduction in traffic along Powerline Road and Military Trail south of SW 10th Street.

Build (Option 3D-1.1)

- Traffic volumes along the Sawgrass Expressway, SW 10th Street, and I-95 increase due to the additional capacity along SW 10th Street.
- There is some additional diversion of traffic at Glades Road on the Turnpike and at some I-95 interchanges, but the diversion is considerably smaller than with the Partial-Build.
- Although not depicted in the forecast tables/figures, the regional model results indicate that the Build alternative diverts traffic from parallel east-west roads such as Wiles Road and Hillsboro Boulevard.

Turnpike																	
Sawgrass Expressway																	

Negative growth.

No-Build – Includes 95 Express Phase 3, 10-lane Turnpike Mainline Widening, 10-lane Sawgrass Expressway Widening.

Partial-Build – Includes No-Build with full interchange at Sawgrass Expressway and SW 10th/95 Express direct connect ramps.

Build – Includes Partial-Build with four-lane SW 10th Express Lanes and intermediate access point between Powerline Road and Military Trail.

Negative growth.

No-Build – Includes 95 Express Phase 3, 10-lane Turnpike Mainline Widening, 10-lane Sawgrass Expressway Widening.

Partial-Build – Includes No-Build with full interchange at Sawgrass Expressway and SW 10th/95 Express direct connect ramps.

Build – Includes Partial-Build with four-lane SW 10th Express Lanes and intermediate access point between Powerline Road and Military Trail.

FDOT	SW 10th Street PD&E Study Project Traffic Forecast Memorandum	SW 10th Street and I-95 (S.R. 9) - Annual Average Daily Traffic	Figure 5.4

5.3 FUTURE ORIGIN-DESTINATION MOVEMENTS

Future year origin-destination flow matrix for the study corridors were developed to estimate the Express Lanes traffic using the ELToD model for three future year scenarios: No-Build, Partial-Build, and Build SW 10th Street. The development of the origin-destination tables were done by time periods and included the following steps:

- Develop future year balanced AADTs using the SERPM subarea model results along with balanced AADTs for the existing conditions (described in Section 5.2).
- Develop corridor DDHVs using the FDOT process of applying Standard K and D factors (Section 5.4)
- Develop 3-hour AM and 3-hour PM peak period traffic by dividing the peak hour traffic by 0.38 for the Turnpike Mainline, Sawgrass Expressway, and SW 10th Street, and 0.36 for I-95. These peak hour to peak period factors were derived using existing traffic counts in these corridors.
- Calculate off-peak period (18-hours) traffic by subtracting AM and PM peak period traffic from the AADTs.
- Perform a matrix estimation process using Cube Analyst to adjust future year SERPM subarea trip tables to match with AM, PM, and off-peak control volumes. The process is very similar to what is described under the model validation section of the report (Section 4.1)

The final products of this process are subarea trip tables for each time period for future years 2020 and 2040. There are 43 zones in the subarea trip tables which were grouped into an 8-zone system. These trip tables were analyzed to identify the through movement volumes on SW 10th Street travelling between Florida's Turnpike and I-95. The through volumes represent vehicles that may use the ELs. **Tables 5.6** through **5.8** provide origin-destination summaries of daily traffic in 2040 for No-Build, Partial-Build, and Build scenarios, respectively. The highlighted cells represent through trips for the SW 10th Street Corridor.

Figures 5.5 through **5.7** depict the 2040 origin-destination patterns for eastbound trips on the SW 10th Street corridor for No-Build, Partial-Build, and Build, respectively. As shown in **Figure 5.5**, in the 2040 No-Build scenario, at the western end near Florida's Turnpike, SW 10th Street carries approximately 26,000 eastbound vehicles. Out of these 26,000 vehicles, 16,200 vehicles travel the full length of SW 10th Street, and either go onto I-95 or continue on SW 10th Street east of I-95. This value is approximately 9,500 vehicles for the existing traffic conditions. For the 2040 Partial-Build Scenario, which includes the new ramps to/from Turnpike to SW 10th Street, eastbound traffic on SW 10th Street near the Turnpike increase to 43,200, as shown in **Figure 5.6**. Out of these, 19,400 vehicles travel the full length of SW 10th Street between Turnpike and I-95. For the SW 10th Street Build Scenario, in which new express lanes are provided between Turnpike and I-95, through traffic increases significantly to 31,700, as depicted in **Figure 5.7**. The uninterrupted high speed travel facilitated by the proposed express lanes increase traffic between the Turnpike and I-95 corridors.

5.4 DESIGN HOUR TRAFFIC FORECASTS

The development of design hour traffic followed procedures outlined in the FDOT *Project Traffic Forecasting Handbook*. Traffic factors were used to convert AADT to corridor design hour traffic. ELToD is then used to split traffic volumes between express lane traffic and general use lane traffic. Details of the process are provided in the following sections.

5.4.1 Future Traffic Factors

The factors used for developing future year design hour traffic include the Standard K, D, and T_{24} factors. The design year K_{STD}, D, T_{24} factors used for study area roadways are presented in **Table 5.9**. The Standard K is the ratio of the traffic volume in the study hour to the AADT. The D factor is the proportion of traffic based on the median (average) for the design hour of the design year traveling in the peak direction. The T_{24} factor is the daily truck factor and the proportion of the AADT volume composed of trucks. For operational analysis, a design hour T factor is used and is calculated to be half of the T_{24}.

The Standard K factor for SW 10th Street and other local roadways is 9 percent. For the Sawgrass Expressway and Turnpike Mainline, peak hour usage is higher because many drivers elect to make off-peak trips on non-tolled roads when those alternative roadways are not as congested. This decision pattern results in a higher K factors what can be found on urban interstates. Therefore, the Standard K factor for the Turnpike Mainline and the Sawgrass Expressway Mainline is higher than the Standard K factor for I-95. Furthermore, some ramps have observed K factors that are higher than mainline Ks. In those cases, observed ramp Ks were used instead of the Standard K in order to maintain consistency growth between the existing peak hour traffic and forecasted ramp traffic.

For the I-95 Mainline, Standard K (i.e., 8 percent) was not adopted for this project because it yielded an annual growth rate of greater than 1 percent, which is higher than the 0.5 percent annual growth rate calculated from the historical AADT trend. Therefore, a K factor of 7 percent was used for I-95 Mainline, which resulted in a peak hour annual growth rate similar to the AADT trends. For the I-95 ramps, an 8 percent Standard K was used.

The D factors for the entire study area corridor were calculated by link for each peak period based on existing and historical data. It should be noted that the net effective K and D factors are different than the input K and D factors utilized for calculations because of balancing, rounding and harmonizing the design hour volumes between the different roadway systems to develop the entire study area corridor volumes. These net effective K and D factors for 2020 and 2040 are provided in **Appendix F**.

Table 5.9
K and D Factors

Roadway	Standard K Factor	D Factor	T_{24}
Sawgrass Expressway Mainline	10.0%	64.0%	4.0%
Turnpike Mainline	9.5%	51.1%	9.0%
I-95 Mainline	7.0% (mainline) and 8.0% (ramps)	56.7%	4.0% to 6.0%
SW 10th Street			
West of Powerline Road	10.0%	64.0%	3.0%
West of I-95 Interchange	9.0%	51.5%	3.0 to 8.0%
SW 10th Street Arterials			
Powerline Road	9.0%	58.0% to 60.8%	4.0%
Military Trail	9.0%	52.7% to 58.1%	4.0%
Other Cross Streets	9.0%	50.0% to 83.8%	4.0% to 6.0%

5.4.2 Future Corridor DDHVs

The 2020 and 2040 AADT volumes resulting from the corridor forecasting effort was used to calculate corridor DDHVs for the mainline and ramps. The corridor DDHVs development process for each system (i.e., Sawgrass Expressway, SW 10th Street, Turnpike Mainline, and I-95) is described below.

Sawgrass Expressway Mainline

The mainline volume for the Deerfield Mainline Toll Point and for the ramps was calculated by applying the K and D factors to the AADTs. The K factor at the Deerfield Mainline Toll Point was adjusted so that the K factor east of Turnpike Mainline interchange depicted Standard K. The volumes for entire study area corridor along the Sawgrass Expressway Mainline were then calculated by adding and subtracting the ramp volumes from the Deerfield Mainline Toll Point. Also, the volumes for the ramps connecting Sawgrass Expressway and Turnpike Mainline were maintained same to achieve balanced volumes between systems.

The development of the future intersection turning movement volumes along the Sawgrass Expressway Mainline involved multiple steps. The first step was to develop the existing turning movement percentages from the existing counts. These existing turning movement percentages were adjusted, where warranted, based on the turning movement splits produced from the future condition model runs. The second step was to develop the cross street DDHVs, which were developed by applying K and D factors to the cross street AADTs produced from the future condition model runs. The third step was to identify a control point on the cross street and apply the turning movements percentages to the cross street DDHVs. Finally, the cross street DDHVs were

balanced and adjusted so the intersection turning movements balanced with the ramp approach volumes and the selected cross street control point volumes.

The Sawgrass Expressway Mainline and ramp design hour volumes for No-Build, Partial-Build and Build alternatives are summarized in **Tables 5.10** through **5.12**, respectively.

SW 10th Street

The SW 10th Street intersection volumes were developed using TMTool. The SW 10th Street volumes development had two control points; the volumes to/from Sawgrass Expressway mainline (west of Waterways Boulevard) was the control point on the west side and the ramp volumes to/from I-95 was the control point on the east side. The SW 10th Street intersection volumes were adjusted to match the control points at each end of the SW 10th Street corridor. The SW 10th Street design hour volumes for No-Build, Partial-Build, and Build alternatives are summarized in **Tables 5.13** through **5.15**, respectively.

Turnpike Mainline

The mainline volume for the Cypress Creek Mainline Toll Point and for the ramps was calculated by applying the appropriate K and D factors to the AADTs. The volumes for entire study area corridor along the Turnpike Mainline were then calculated by adding and subtracting the ramp volumes from the Cypress Creek Mainline Toll Point as the control volume. The ramp terminal intersection turns were developed using a similar multi-step manual process as the Sawgrass Expressway. The Turnpike Mainline and ramp design hour volumes for No-Build, Partial-Build, and Build alternatives are summarized in **Tables 5.16** through **5.18**, respectively.

I-95 Mainline

The mainline segment north of Hillsboro Boulevard was used as the I-95 mainline control point to calculate the study area corridor volumes. The mainline segment north of Hillsboro Boulevard and ramps volumes were calculated by applying the K and D factors to the AADTs. The volumes for the entire corridor along the I-95 Mainline were then calculated by adding and subtracting the ramps volumes; using north of Hillsboro Boulevard as the control volume. TMTool was used at the ramp terminal intersections to determine the intersection approach volumes. The I-95 mainline and ramp design hour volumes for No-Build, Partial-Build, and Build alternatives are summarized in **Tables 5.19** through **5.21**, respectively.

5.4.3 Express Lane Volumes

ELToD was run for both model forecast years of 2020 and 2040. The input to ELToD was the peak period origin-destination matrices developed through the matrix estimation process previously discussed. The ELToD assignment provided hourly volumes, including the design hour, for all roadway links in the study area. A final process of balancing and harmonizing the initial corridor DDHVs with ELToD splits was performed to ensure a continuous set of express lane and general purpose lane volumes for the corridor.

The No-Build alternative 2020 and 2040 DDHV turns and express lane volumes are depicted in **Figures 5.8** through **5.17**. The Partial-Build alternative 2020 and 2040 DDHV turns and express lane volumes are depicted in **Figures 5.18** through **5.29**. The Build alternative 2020 and 2040 DDHV turns and express lane volumes are depicted in **Figures 5.30** through **5.41**.

Appendix G contains the 2040 DDHV turns and express lane volumes for Build Option 3A and 3D-1.2 through 1.6 (Center Alignment).

SW 10th Street and I-95 (S.R. 9) - 2040 PM Build DDHV's

Figure 5.41

FLORIDA'S TURNPIKE

The traffic operations analysis for the roadway segments are based on *2010 Highway Capacity Manual* (HCM) methodologies.

Intersections were analyzed using Synchro software (Version 9.2, Build 914, Revision 6). A lost time adjustment of -2 seconds has been applied to all ramp intersections and major arterials originating movements.

6.1 NO-BUILD 2040

The analysis was performed with 2040 No-Build Directional Design Hour Volumes (DDHV), intersection lane configurations, and signal timing plans, as of May 2018, without optimization.

The results of the 2040 No-Build unsignalized intersection analysis on SW 10th Street and its cross streets are provided in **Table 6.1**. Results show unacceptable performances at three unsignalized intersections along SW 10th Street and one along South Military Trail.

Table 6.1
No-Build 2040 SW 10th Street Unsignalized Design Hour Intersection Analysis Results

Main Roadway	Cross Street	LOS (Delay)	
		AM	PM
SW 10th Street	Industrial Park	F (90.2)	F (285.0)
	SW 30th Avenue	F (140.4)	F (308.7)
	SW 24th Avenue	F (101.3)	F (95.3)
	Driveway East of SW 24th Avenue	A (0.5)	A (0.7)
	Driveway West of S Military Trail	A (1.9)	A (4.4)
S Military Trail	East Drive	A (0.7)	A (0.6)
	Lakes at Deerfield	A (1.2)	A (0.9)
	Horizon Club	B (13.5)	F (*)
Newport Center Drive	SW 12th Avenue	A (4.6)	B (12.7)
Powerline Road (S.R. 845)	Quiet Waters North	A (0.1)	A (0.3)
	Quiet Waters South	A (0.5)	A (0.1)
	American Way	A (0.9)	A (0.4)

Notes:
(*): No delay reported) does not meet HCM 2010 criteria)
Delay is in seconds/vehicle
Level of Service (LOS) E or F, reflecting unacceptable/failing operations

The signalized intersection analysis of the Sawgrass Expressway, SW 10th Street, Florida's Turnpike, and I-95 is summarized in **Tables 6.2** through **6.9**.

Results for signalized intersections along Sawgrass Expressway indicate that overall, no intersection fails in either design hour though individual movements operate over capacity (LOS F) in both design hours. The intersections at Lyons Road and Sawgrass Expressway Eastbound ramp and University and Sawgrass Expressway Eastbound ramp operates at capacity (LOS E) in the morning design hour.

Results for signalized intersections along SW 10th Street indicate that the Powerline Road, South Military Trail and I-95 northbound ramps intersections operate(s) at LOS F in both design hours. The East New Port Center Drive intersection operate(s) at LOS F in the afternoon design hour. The SW 28th Avenue in the morning and the FAU Research Boulevard in the afternoon operate at capacity.

Results for signalized intersections along the Turnpike Southern Coin corridor indicate that overall, the intersections Sample Road and Turnpike northbound ramp, Coconut Creek Parkway and Turnpike ramps/NW 31st Avenue operate(s) at LOS F in the morning; the intersections Glades Road and Turnpike ramps and Sample Road at Turnpike southbound ramps operate at capacity in the morning while the Coconut Creek Parkway at Turnpike ramps/NW 31st Avenue operates at capacity in afternoon. No intersection fails in the afternoon design hour.

Results for signalized intersections along the I-95 corridor indicate that the intersection at Hillsboro Boulevard and SW Natura Boulevard operate(s) at LOS F in the morning and operates at capacity in the afternoon. No intersection fails in the afternoon. The intersection of Sample Road and NE 3rd Avenue operates at LOS E in both design hour; the intersection of Hillsboro Boulevard and SW 12th Avenue operates at LOS E in the afternoon.

The Synchro analysis is provided in **Appendix I**.

Synchro 9.2.914.6

LOS Notes:
HCM 2000 level of service (LOS) and delay results from Synchro
Delay is in sec/veh units
LOS E reflecting at capacity operations
LOS F reflecting over capacity operations

Queue Notes:
HCM methodology does not report queues, results are from Synchro outputs report
~: Volume exceeds capacity, queue is theoretically infinite
#: 95th percentile volume exceeds capacity
m: Upstream metering is in effect

6.2 PARTIAL-BUILD 2040

The analysis was performed with 2040 Partial-Build Directional Design Hour Volumes (DDHV), intersection lane configurations, and signal timing plans, as of May 2018, without optimization.

The results of the 2040 Partial-Build unsignalized intersection analysis on SW 10th Street and its cross streets are provided in **Table 6.10**. Results show failures at three unsignalized intersections along SW 10th Street and one along South Military Trail.

Table 6.10
Partial-build 2040 SW 10th Street Unsignalized Design Hour Intersection Analysis Results

Main Roadway	Cross Street	LOS (Delay)	
		AM	PM
SW 10th Street	Industrial Park	F (67.8)	F (*)
	SW 30th Avenue	F (*)	F (301.8)
	SW 24th Avenue	A (8.0)	A (1.4)
	Driveway East of SW 24th Ave	A (0.2)	A (0.7)
	Driveway West of S Military Trail	A (0.3)	A (1.0)
S Military Trail	East Drive	A (0.7)	A (0.8)
	Lakes at Deerfield	A (1.1)	A (1.0)
	Horizon Club	A (7.3)	F (424.1)
Newport Center Drive	SW 12th Avenue	A (5.2)	D (30.6)
Powerline Road (S.R. 845)	Quiet Waters North	A (0.1)	A (0.3)
	Quiet Waters South	A (1.3)	A (0.1)
	American Way	A (1.1)	A (0.5)

Notes:
(*): No delay reported (does not meet HCM 2010 criteria)
Delay is in seconds/vehicle
Level of Service (LOS) E or F, reflecting unacceptable/failing operations

The signalized intersection analysis of the Sawgrass Expressway, SW 10th Street, Florida's Turnpike, and I-95 is summarized in **Tables 6.11** through **6.18**.

Results for signalized intersections along Sawgrass Expressway indicate that no intersection fails in either design hour.

Results for signalized intersections along SW 10th Street indicate that the Waterways Boulevard, Independence Drive, South Powerline Road, SW 28th Avenue, and South Military Trail intersections operate at or over capacity (LOS E or LOS F) in both peak hours. The East Newport Center Drive intersection operates at LOS E in the afternoon design hour.

Results for signalized intersections along the Turnpike Southern Coin corridor indicate that the intersection at Coconut Creek Parkway and Turnpike ramps/NW 31st Avenue fail in the morning and operates at LOS E in the afternoon peak.

Results for signalized intersections along the I-95 corridor indicate that the intersection at Hillsboro Boulevard and SW Natura Boulevard operates at full capacity (LOS E) in both peak periods.

The Synchro analysis is provided in **Appendix I**.

Synchro 9.2.914.6

LOS Notes:
HCM 2000 level of service (LOS) and delay results from Synchro
Delay is in sec/veh units
LOS E reflecting at capacity operations
LOS F reflecting over capacity operations

Queue Notes:
HCM methodology does not report queues, results are from Synchro outputs report
~: Volume exceeds capacity, queue is theoretically infinite
#: 95th percentile volume exceeds capacity
m: Upstream metering is in effect
