SSUG 10-24-19

1957 – Incorrect "Last Updated" in Email Response Plan items

Tucker Brown

Issue

- The Email response plan item is populated when the response plan is generated

- This may be out of date by the time the response plan is activated, particularly if the response plan is reactivated more than once

Proposed Solution

- Option 1 - Alert the operator if they activate the plan without regenerating the email item

- Option 2 - Automatically update the information within the email (could be problematic due to dynamic operator text input)

QUESTIONS?

2510 – Indicate removed items in Current Response Plan list prior to plan activation

Tucker Brown

Issue and Proposed Enhancement

- Issue: When a response plan item is removed from a previously activated Current Plan, the Current Plan no longer reflects roadway conditions

- Proposed Enhancement: Indicate that the response plan item is set to be removed, but don't remove it from the Current Plan until the plan is reactivated

QUESTIONS?

3800 – Reporting of more accurate locations

Tucker Brown

Issue

- Event Locations are preconfigured with lat/lon's that make sense operationally but are not necessarily accurate.

- This also allows us to pre-review the location descriptions that will be published to FL511.

- But there are some applications that need an accurate lat/lon.

  - Crash studies is an example, but this is a recurring issue at the Central Office

Proposed Enhancement

- Store an optional "accurate" lat/lon, much like we do with devices.

- Sources of accurate lat/lon:

  - "Place on Map"?

  - Enhance SPARR App?

QUESTIONS?

4965 – Add support for mileage tracking in SPARR interface

Tucker Brown

Issue and Proposed Enhancement

- Miles travelled is tracked by the RR AVL Driver but not by the SPARR driver

- Proposed Enhancement: add this functionality to the SPARR driver
  - Driver will enter odometer reading at start and end of shift
