

# 3974 – Permission Issues

Tucker Brown

- With the change from Admin to Map configurations, user permission granularity appears to be revisited.
- Examples
  - For TSS/CCTV, changing Op Status requires “Add/Modify/Delete detectors”
  - TVT needs "Configure travel time parameters“ is needed to enable/disable links
  - Reports needs the ability to configure the report to run a report
- Would like to gather other examples that people are having issues with and fix them all at once.

QUESTIONS?

3986 – Sending messages to non-color and color sign via SAS

# Current Situation

- In D6 SAS schedules for DMS, can get into a scenario where there is a color message scheduled with non color DMS included.
- The message is sent, but will fail on the non-color signs
  - They do not recognize the color tag
- D6 sets up two schedule items, one for color and one for non-color messages
- Would like something that can send color messages to color signs and non-color messages to non-color signs all in one scheduled item

# Option 1

- Enter a message (graphic or color message) into a scheduled item
- If a sign supports graphics and color, send message as is
- If a sign support color but not graphics, remove the graphic tag
- Non-color sign, remove both graphic and color tags
- Might be able to include abbreviations from EM to account for size differences
- Should we have a restriction on saving, i.e. message doesn't fit on sign, cannot save

## Option 2

- Use predefined plan concept with SAS
  - New plan type
- Allow users to specify different messages per sign
  - Use graphic/color as needed
  - Abbreviations not needed as editor would restrict the user entering the message
  - Filter in configuration grid could indicate which signs support color or graphics
- Schedule item would then activate a plan not a message

QUESTIONS?

# Executive Notifications

- Questions from ConOps
  - Can we add “Greater than X Fatalities” to the injuries field within the EM GUI?
  - Fog/smoke – Can we autotrigger if a crash has a visibility event associated to it?
    - Associated how? Primary/secondary relationship? Visibility alert associated to crash?
  - Any Districts interested in receiving everyone else’s notifications?

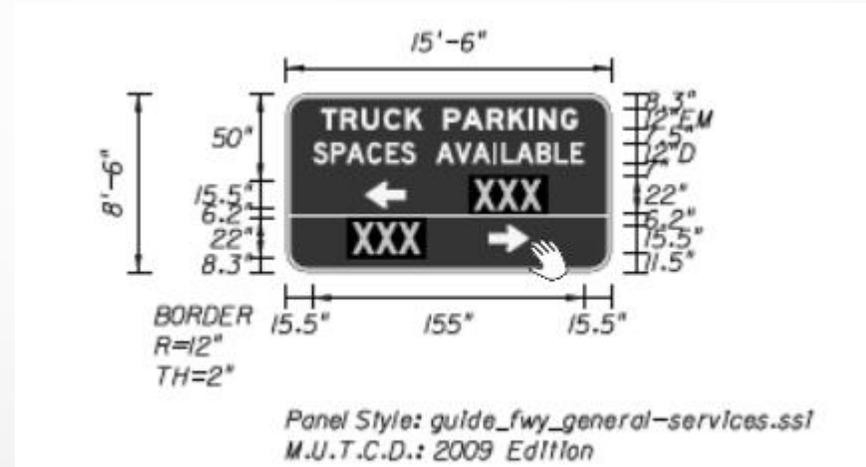

# Truck Parking

Derek Vollmer

## Multiple Rows

- Some rest areas have two rows of truck parking
- Can only access one row. Truck driver needs to make a decision
- Need to place a sign inside the facility indicating space availability for each row.

# Multiple Rows

- Need a threshold per row to post 0 or “LOW.”
  - Is there a preference for LOW? Currently SunGuide posts 0.
- Anyone want the alerts per row?
  - Currently alert is for the entire facility

# Turnover rate

- Freight Planning would like to know how long Trucks are parking in spaces
  - Currently, SunGuide just gets a total number of spaces occupied/available for a facility
  - All protocols support getting individual space information
  - Create a truck parking driver (not use TSS anymore) to handle this information
    - Single driver with multiple protocols
  - Don't need to show this at the UI level. Can store in database for reporting purposes.

# Maintenance Information

- Not all protocols have maintenance information
- For protocols that do, is anyone interested in retrieving this information
- Can include
  - Detector level status
  - Battery health
